The federal constitution of Achaea goes back to the 5th century BC. The early confederacy appears to have been divided into 12 *merea* (units), each of which sent a contingent of delegates to the federal board of *damiourgoi* and to the oligarchic assembly at Aigion. By 389 the league had adopted a system of double citizenship: in that year the *koinon* incorporated Naupactus on the north coast of the Corinthian gulf by granting federal citizenship to its inhabitants. After 324 the league seems to have been broken up by Demetrius, but it was revived in 281/80 on the initiative of four Achaean cities (Pharae, Dyme, Tritaea, Patrae). The newly established federal state soon rose to great prominence. From 251, when Sicyon joined, the league gradually expanded and finally embraced the whole of the Peloponnese. Its main political body was the representative council, the *synodos*, assembling at Aigion. Additionally, there existed a federal primary assembly, the *synkletos*, which was concerned with extraordinary business. In both the *synodoi* and the *synkletoni*, votes were taken by individual cities. The league's executive rested with the annual board of ten *damiourgoi* and two *stratego*i (after 255 BC reduced to one). Election took place in the *archairesiai* (election meetings) of the Achaean citizens. With Roman support, the federal state became the most important single power in mainland Greece in the 2nd century BC. However, economic crisis and class struggle soon led to strained relations and to open resistance against Rome. In 146 the Achaean federal state was dissolved by Lucius Mummius. Like the late Boeotian *koinon*, it continued to serve as a community for cultural and religious ceremonies, until the province of Achaea was established in 27 BC.

Festivals

In a society that did not have the modern system of weeks – and accordingly, weekends – regularly recurring festivals offered opportunities not only for repose and entertainment, but also for maintaining contact with one's fellow citizens, and, on a more practical level, for eating meat. It is estimated that more than 60 days out of the Athenian year of 360 days were given over to festivals, when normal business – at least of an official nature – was suspended (the equivalent of our bank holidays). This compares well enough to modern western practice.

The Greek word for festival was *heorte*, which was used for most communal celebrations with a religious component. This would involve a sacrifice, conducted usually in the deity's sanctuary. This meant that the sacrificial beast had to be brought to the place of sacrifice, a requirement that easily developed into a procession (*pompe*), sometimes very elaborate, in which the beast was accompanied by the priest, the butcher, other cult and public officials, and the public. The Heraia of Argos, for example, began with a procession that led from the city across the Argive plain to the Heraion, which served to demonstrate to the people of the Argolid, and remind them of the fact, that the Argolid belonged to Argos.

The essential feature of any festival was the actual gathering of people to participate, and, depending on the nature of the celebration, to watch. The supposed birthdays of gods and heroes were marked by celebrations, monthly and/or annual. Many festivals marked stages in the agricultural cycle. Such was the basis of the various Dionysiac rites celebrated during the late winter and early spring, to signal – and in some cases to stimulate – the reawakening of plant and animal life after the rigours of winter: Lenaia, Dionysia, Thyia, Agrionia. Similarly, the successful growing of grain was the goal of a whole series of rituals focused on Demeter and Kore Persephone, the most notorious of which were the Thesmophoria, a rite restricted to women.

There were other rites in which participation was restricted. These included festivals devoted either wholly or in part to the initiation of new members into a relatively closed community. Mystery rites – *teletai* – are one example of this kind of festival. The best known were those at Eleusis and Samothrace, which admitted initiates regardless of citizenship. Then there were the various rites of passage from one age group to another in the course of progression from childhood to full citizenship, which were part of larger local festivals. Thus at Athens one day of the Apatouria was given over to the admission of ephebes to the status of manhood, while something similar lies behind the confused rituals of the Spartan *agoge* (education system).

Festivals might range from relatively simple commemorations to full-scale celebrations, with formal procession, sacrifice, competitions (*agones*), and an attendant market and fair (*agora*). The inscription that sets out the arrangements for the festival connected with the celebration of the mysteries at Andania in Messenia is a mine of information. It dates from 92 BC, when one Mnasistratos, to whose family the operation of the mysteries had been entrusted in the past, turned over the operation of the cult to the state. We learn that, in addition to the initiatory ceremonies proper, there were extensive public celebrations. The sanctuary was out in the countryside, and

arrangements had to be made to house, feed, water, bathe, and police the multitude who came. All we are really told about the mysteries is that new initiates were sworn in by former initiates – male and female – and that all of them had to dress in specific kinds of clothing. The “open” festival included a procession in which all the officiants as well as the priests and priestesses of other sanctuaries in the region took part, and in which sacrificial beasts were escorted. There was a sacred feast from the meat of the sacrificed animals, and performances of music and dancing. Close attention is paid to the regulations for the market, which was clearly an important feature of the festival. The whole – festival, mysteries, market – was open to men, women, children, free or servile (indeed, an area was set aside for slaves to seek refuge).

The term *panegyris* (an Aeolic form meaning literally “gathering of all”) is reserved for festivals with a wider than purely local appeal. It appears in a fragment attributed (possibly falsely) to Archilochus, which refers to a *panegyris* of Demeter and Kore (fr. 322 West). An early description of such a festival – although it does not employ the actual word – is the gathering of Ionians with their children and wives on Delos, where, according to the author of the *Homeric Hymn to Apollo*, they regularly delighted the heart of the god with competitions in boxing, dancing, and song. The festivities also included hymns sung by the girls of Delos in honour of Apollo and Artemis and their mother Leto.

From the other end of antiquity we have a long inscription from Oenoanda in Lycia, dating from the reign of Hadrian, which records the foundation of a *panegyris* by a local tycoon (Caius Julius Demosthenes). The document gives a detailed account of the programme of events of a musical and theatrical (thymelic) agon. The festival was spread over 22 days beginning on the first day of the month (in high summer) with a competition for trumpeters and heralds (essential features of any festival: the victorious trumpeter would summon the multitude, the herald would announce the programme and dispense other information). The second to fourth days were reserved for public business: meetings of the council and assembly of the polis. The first competitions proper (the sequence and range of competitions are more or less identical in surviving victors’ lists from all over the Greek-speaking world) were held on the fifth, when composers of prose encomia (probably in honour of members of the imperial family and important local people) competed. The sixth day was given over to the market. On the seventh day epic poets competed, on the eighth and ninth aulos players with chorus, and on the tenth and eleventh comic poets. On the twelfth day of the month there was a sacrifice to Apollo Patroos (patron god of the polis),

followed on the thirteenth and fourteenth by the competitions of tragic poets, and on the fifteenth by a second sacrifice to Apollo Patroos. Singers with cithara accompaniment competed on the sixteenth and seventeenth days, and the agon proper ended on the eighteenth with a final open competition for all (perhaps all the victors in preceding competitions). For all these, prizes were awarded, in most cases to those who finished second as well as first. From the nineteenth to the twenty-first, hired mimes, singers, and other entertainers performed, but not in competition, and finally on the twenty-second day there were gymnastic events open to citizens (the inclusion of a few athletic competitions in musical festivals – and vice versa – is not unusual under the empire). During this *panegyris*, which took place in the theatre, the agonothete (president of the competition), priests, functionaries, civic dignitaries, and representatives from surrounding towns and villages processed through the theatre, and each individual group sacrificed according to a fixed schedule. There were penalties for non-participation.

The earliest competitive festivals (*agones*) we read of are the funeral games in honour of Amphiaraus of Chalcis, presumably a real person (Hesiod, *Works and Days*, 650–59), and the fictional games for Amarantheus of Epeia (*Iliad*, 23. 629–45) and Patroclus, the last vividly described in *Iliad*, 23. 297–897. Such games would naturally have been casual occasions, but they provided the model for games celebrated annually in honour of heroes. The Herakleia were celebrated at about the time of the winter solstice, when the people of Boeotia performed public rites in honour of those who had died in the service of the state.

The best-known ancient Greek festivals were the four great Panhellenic gatherings at Olympia, Delphi, the sanctuary of Poseidon at the Isthmus of Corinth, and the sanctuary of Zeus at Nemea. Each of these sanctuaries was well placed to be a centre for an interstate festival: Olympia was at the confluence of the rivers Cladeus and Alpheus, and, as its name reveals, it was at the southern end of a land route used by transhumant herders, linking the Peloponnese with the north and northeast of the Greek mainland, where Mount Olympus looms. Similarly, Delphi is at the southern end of an overland corridor joining the north to the Gulf of Corinth. Both Olympia and Delphi were also easily accessible by sea to the Greek settlements in the west, a fact that greatly accelerated the pace and extent of their growth from local to interstate/Panhellenic meeting place. Isthmia is at the southern end of the portage across the Isthmus, which linked the gulf of Corinth and the Saronic gulf. Nemea, although at first glance of lesser importance, in fact lies astride a major north–south land route in the Peloponnese.

All of these festivals – Olympia, Pythia, Isthmia, Nemea – began as purely local operations. The first to attract a wider clientele was Olympia, where the list of victors in the stadium race begins at 776 BC, a date that more or less matches the archaeological record. The Olympic games probably began relatively simply, with the foot race, other competitions being added as time passed. During its early years the Argives and Spartans were major patrons; in the early Classical period much interest was shown by rich and powerful Hellenes from Sicily and southern Italy. The Pythian games traditionally began with a single competition, the performance of a hymn in honour of Apollo. By early in the 6th century BC (traditionally after the so-called First Sacred War), the Pythia, which had originally been celebrated at intervals of eight years, had become, like the Olympic games, pentaeteric, that is, they were celebrated every four years (every five by the inclusive reckoning used in antiquity). Furthermore, athletic contests were added to the musical ones (the Olympic games, on the other hand, remained strictly athletic). Delphi too attracted the patronage of Sicilians and Italians. At about the same time – c.582 BC – the Isthmian games became Panhellenic, to be followed a few years later (c.573 BC) by the Nemean games. Both the Isthmian and the Nemean games were trieteric, celebrated every second year. The Isthmia were originally athletic only, with musical competitions being attested from the 3rd century BC. The Nemean games included both musical and athletic contests. The games of the cycle – the *periodos* – were preceded and followed by a Sacred Truce, so that competitors and visitors might have safe passage to and fro (not so much a “truce” as we know it, rather an agreement not to seize the persons or property of people travelling to and from the site of the festival: in later antiquity these arrangements were not limited to the Periodic games). Olympic and Pythian games were held at the same time of year (late August/early September) with a two-year interval between them; the Isthmian games were held in April/May of every Olympian/Pythian year, and the Nemean games in July of every off-year, giving, for example, the following sequence for an Olympiad: 488 BC Olympia and Isthmia; 487 BC Nemea; 486 BC Pythia and Isthmia; 485 BC Nemea; 484 BC Olympia and Isthmia.

These contests were what was later called *stephanitai*, that is, the prize for victory was not monetary, but in the form of a wreath (*stephanos*), of wild olive for the Olympia, bay leaves for the Pythia, pine, later dry celery for the Isthmia, and fresh celery for the Nemea. Victors in these games could count on receiving more material rewards at home, in recompense for the glory they brought their communities: at Athens, for example, victors at the Olympic games (at least those well enough off to have entered a horse or chariot) were

fed at public expense in the Prytaneum. The glory of such victories is also reflected in the epinician odes commissioned from such poets as Simonides, Bacchylides, and Pindar.

The polis of Elis was responsible for the Olympic games. The Pythian games, like the Delphic oracle, were governed by a genuine interstate body, the Delphic amphictyony. The Nemean games seem to have begun as a festival shared between the towns of Cleonae and Phlius, but eventually came under the control of Argos. The Isthmian games were Corinthian, except during the period 156–44 BC when Corinth lay in ruins and the direction of the games was assumed by Argos. (Argos became one of the two headquarters – the other being Thebes – of the guild of actors and musicians called the “Isthmian and Nemean Artists of Dionysus”: these Hellenistic guilds – the other major associations were the Athenian guild and the guild of artists of Ionia and the Hellespont – ensured the participation of professional competitors at agons great and small.) Despite the fact that three out of four of these festivals were run by a single state, all four reached and held the status of interstate, Panhellenic festival, probably because they were clearly tied to the rural sanctuary in which they were held, rather than to the state itself. By contrast, the Panathenaia of Athens, founded or expanded in the 6th century BC, which included both musical and athletic contests, and for which huge amphorae were given as prizes, never reached true Panhellenic status. This was probably because they were too closely linked with Athens: the name itself was a form of propaganda.

A significant change in the world of Greek competitive festivals came with the institution of the Soteria at Delphi, first founded to celebrate the defeat of the Gallic invasion of 279/78 BC, and in the mid-3rd century BC refounded as a pentaeteric festival of Panhellenic pretensions by the dominant Aetolian League. This started a veritable flood of new festivals, many of them pentaeteric, throughout the Hellenistic world, whose organizers sought acceptance of their new or enhanced status from the Aeolian-controlled Delphic amphictyony, as well as from any other political power that would grant it. The main attraction of these games for competitors was the prizes, usually in the form of wreaths of gold or silver. The holding of such a festival and its acceptance became an important feature of international relations during the Hellenistic period, and it is probably true to say that these festivals were one of the most powerful instruments in fostering and maintaining Hellenic identity in late antiquity.

Finance

Finance is the process by which individuals or groups collect and expend funds. This article focuses on governmental revenue and expenditure.

The earliest preserved financial documents from Greece are records of inventories and payments dating to the Mycenaean period (c.1600–1100 BC). Mycenaean Greece was organized into kingdoms staffed by officials who collected mandatory contributions from the king's subjects. Payments were made “in kind”, i.e. in the form of produce such as grain or objects such as axes. Some of this revenue was used to support the royal household and the military. The remainder was redistributed to the kingdom's subjects in proportion to each individual's position in the political hierarchy.

After the collapse of Mycenaean civilization, both government and finance were greatly simplified. A king with strictly limited powers drew revenue from a piece of public land called a *temenos*, the produce of which was given over to him as long as he held power. Significant gains were also won through war and piracy. The king's financial responsibilities included funding military and religious activities and the entertainment of local nobles and foreign visitors.

Around 800 BC more complex state forms emerged. A sense of the different kinds of financial arrangements which were found in Greece thereafter can be had by looking at three examples: Sparta, Athens under Pisistratus, and Athens under democratic rule.

The Spartan state was controlled by a military elite, the members of which neither worked nor paid taxes. They were supported by serfs called helots who tilled the estates of the elite and who were required to provide specified amounts of various foods to their master's household. No other regular taxes existed except for small gifts made to the kings. This remarkable absence of taxation was possible because governmental apparatus was minimal. The lack of revenue sources

was, however, a problem in wartime when military expenses had to be met, sometimes only with difficulty, from the contributions of Sparta's allies, from the sale of booty, and from voluntary offerings by Spartan citizens.

Athens under Pisistratus presents a very different picture. Pisistratus became sole ruler (tyrant) of Athens in 546 BC. The primary source of revenue for his government was a tax on agricultural produce. State expenditures included the maintenance of police and military forces, the completion of a substantial building programme, and the celebration of religious ceremonies. A key feature of this financial system was the imposition of a direct tax on all inhabitants of Athens. (Direct taxes are levied on an individual's income or personal wealth. Indirect taxes are levied on services or transactions. Income taxes are an example of the former, sales taxes of the latter.) The obligation to pay direct taxes was seen as a form of subservience and thus as a sign of despotic rule.

The democratic government which came to power in Athens in 514 BC kept elaborate records, many of which are preserved. These, along with contemporary literary sources, provide unusually detailed evidence about financial practices.

The revenue of the Athenian state in the mid-5th century BC came from five sources: rents on state property, indirect taxes, direct taxes, tribute, and liturgies (see table). While indirect taxes were paid by all Athenians, direct taxes were normally paid only by resident aliens, each of whom was required to pay a yearly fee (a "head tax"). The Athenian state also derived revenue from the tribute it extracted from its allies. (Liturgies are discussed below.)

Revenue of the Athenian State

Rents on State Property

Indirect Taxes

Direct Taxes

Tribute

Liturgies

The revenues of the Athenian state were expended as follows. About 35 per cent of the total was used to support the military. Public works, particularly the massive building project which produced the Parthenon, consumed another 20 per cent. The internal administration of Athens involved the paid participation of thousands of citizens and thus resulted in heavy expenses for jurors (12 per cent) and for various other officials (7 per cent). Expenditures for religious ceremonies (10 per cent), for the support of orphans and invalids, and for the police force (about 6 per cent each) made up most of the rest.

In wartime, expenses increased significantly; this frequently put Athens in a difficult financial position, and upon occasion an

emergency property tax (*eisphora*) was levied on all residents including citizens.

The administrative machinery which organized Athenian finance was quite simple. Governmental budgeting – projecting and adjusting total future revenue and expenses – did not make its appearance in Greece until the 19th century AD.

Fishing

The Mediterranean is an enclosed sea, consisting of deep basins with poor water circulation and therefore limited distribution of nutrients. Annual evaporation rates exceed replacement from rivers and as a consequence the sea is saltier than waters of the north Atlantic. Sea temperatures are lower and the important commercial fish stocks of the Atlantic, such as cod and herring, are absent. In general, the Mediterranean is lacking in fertility and, although evidence is not conclusive, this appears always to have been the case despite changes to sea level in the Pleistocene–Holocene transition.

Although the seas of the Aegean and eastern Mediterranean are less fertile than the waters of the north Atlantic, they support a wide range of species. Over 1500 species of marine invertebrate are reported for the Mediterranean as a whole, and around 100 of these are edible. In Greek waters 447 species of marine fish have been recorded, comprising important pelagic species such as tuna, mackerel, and anchovies as well as a great variety of demersal species including the important families of Serranidae (grouper), Sparidae (sea bream), Labridae (wrasses), Mugilidae (mullet), and Scorpaenidae (scorpion fish). Numerous species of edible shark and ray exist, and turtles and

marine mammals are also present. The variety of species means that fishermen are able to engage in diversified fishing and are not dependent on single species, whose stock levels may fluctuate annually and interannually.

A variety of fishing methods are recorded for antiquity, and archaeological evidence suggests that many of these methods go back into prehistory. Many of these fishing methods are still in use today. In the 2nd century AD the writer Oppian described four methods, namely the use of hooks, nets, weels (wicker basket traps), and tridents. Line fishing using hooks can employ a stationary line (as with the set line, the *paragathi*), a trolling line pulled behind a moving boat, or involve the use of a rod. Nets include simple nets (gill nets, cast nets, drag nets, and seine nets) or complex nets such as the three-walled *manomena*, a trammel net. The madrague (or *tratai*) is a specialized fishing method employed for catching tuna. A lookout alerts fishing boats to the arrival of a shoal of tuna and the fish are chased through a series of nets placed parallel to the coast until they reach a death chamber where they are gaffed. In the ensuing melee, many fish are killed by others in a frenzy. Aeschylus compared the slaughter of the Persians at Salamis to this fishing method. Weels, baskets, and pots are used to catch a range of fish and shellfish. Tridents were often employed at night with lights.

The earliest evidence for marine exploitation occurs at the littoral zone. Eels are generally caught by trapping and these and demersal and littoral species dominate the earliest evidence during the Final Palaeolithic and Early Mesolithic. Evidence for the use of boats corresponds with the appearance of tuna remains, together with obsidian from the island of Melos, in Upper Mesolithic levels at Franchthi Cave in the southern Argolid. The two key sites for the prehistoric period are Franchthi Cave and the Cave of Cyclops on the island of Youra in the north Aegean. Youra has produced the largest known collection of bone fish hooks and fish gorges for any period in Greece. At both sites the proportion of fish remains in the total food refuse declines dramatically at the beginning of the Neolithic.

Iconography during the Bronze Age is an important source of information about fishing and marine exploitation. The Minoans and the residents of Akrotiri (Thera, modern Santorini) were fond of marine imagery and the fresco of the fisher-boys at Akrotiri shows a mixed catch of dolphin fish (*Coryphaena hippurus*) and mackerel (*Scomber* sp.). The extraction of purple dye from the shellfish *Murex brandaris* occurs from Middle Minoan times. The set line or *paragathi* is also attested from Middle Minoan times, and lead weights that could well have been used for trammel nets date from the late Bronze Age.

Homer's heroes did not eat fish, but whether this reflects a common

practice or is simply an indication of the social status attached to various foods is unclear. The poems do, however, make mention of spears, nets, rods, and handlines which suggests that fishing was widely practised. The low status of fishermen is apparent in later periods, as they are commonly the object of jokes in comic theatre.

Classical Greece, or more particularly Athens in the 5th century BC, imported a broad range of foodstuffs, and expensive fish were part of the conspicuous consumption of the urban wealthy elite. Greek food consisted of staples like bread (*sitos*), drink notably wine (*poton*), and *opson*, the relish that accompanied these staples. The term *opson* survives in modern Greek as the word for fish, *to psari*.

Some of the most important “relishes” that accompanied food were fermented fish products such as *tarikos*, known to the Romans as *garum* or *salsamentum*. The earliest mention of salted fish is in the Hippocratic Corpus and the first mention of fish sauce is in Dioscurides, but Greeks no doubt ate salted and preserved fish well before these literary references. A 5th-century BC house at Corinth produced Punic amphorae, the sherds of which have preserved fish attached. Various species of fish and shellfish could be used in the process and the result is comparable with the modern Vietnamese fish sauce, *nuocmam*. No fish-processing centres have yet been excavated in Greece, although salting factories are known for the Roman period. Roman fish tanks are found in eastern Crete at Siteia, Chersonisos, and Mochlos. Such facilities could have been used to breed or store fish, but at none of these sites is there evidence for associated salting facilities.

Florina

City in western Macedonia

According to the 14th-century memoirs of John Kantakouzenos, while Byzantium was facing a Serbian invasion in Macedonia in 1334, a notable from Constantinople, Sphrantzes Palaiologos, was appointed to the command of a province consisting of four small towns in western Macedonia, Chlerenon, Soskos, Staridola, and Debre. The first-mentioned among them, Chlerenon, can be safely identified with Florina, being the original Slavic name of the town, which is still known as Lerin in Slavonic languages. Florina is the later, Ottoman, name of the town which was also adopted by the Greeks.

The mention of Florina in the text of Kantakouzenos is the earliest record of the town which had remained in obscurity until then. The town's insignificance is also reflected by the absence of any high ecclesiastical authority there. Florina remained under the jurisdiction of the bishop of Prespa until the late 19th century when it was transferred to the diocese of Moglena. However, efforts were made by the Bulgarian exarchate to establish a metropolitan see of its own in Florina in the late 19th century.

The town is described for the first time in an Ottoman fiscal register of 1481. According to the data it provides, Florina had a population of approximately 1201 people (981 Christian, 220 Muslim). The Christian element of Florina's population was of a mainly Slavic ethnic character, as suggested by the personal names recorded. The same register points to an economy based on agriculture, as most of the town's fiscal revenue was of an agrarian provenance. In later centuries the town retained the agrarian basis of its economy, with commerce and handicrafts catering for local demands. Yet, the proximity of Florina to the principal land route which followed the course of the Roman Via Egnatia facilitated its contact with adjacent and more distant regions. Florina had grown bigger by the second half of the 17th century when it is described by Evliya Çelebi as having 1500 houses (which corresponds to a population of about 7500 people), 14 mosques, three religious colleges (madrasas), and one dervish convent (*teke*).

The Christian population of Florina and the surrounding area was primarily Slavic, though the Vlachs had a considerable presence, and other ethnic groups, such as Greeks and Armenians, were no doubt represented during the Middle Ages and the centuries of Ottoman rule. The people of Florina were receptive to Greek cultural influences, first from the Greek-dominated Orthodox Church, then through the establishment of Greek schools during the 19th century. The intensification of Greek cultural influence coincided with the age of

nation-building ideas. As a result, the adoption of Greek cultural features, including the language, first bilingually then exclusively, was accompanied by the building of a Greek national identity among people of different ethnic backgrounds, including a percentage of the Slavs, in the district of Florina. Bulgarian reaction in the late 19th century led to strong rivalry in the areas of religion and education as the Bulgarians established their own institutions in order to counteract Greek progress in shaping local national sentiment. This Graeco-Bulgarian confrontation culminated in fighting which was particularly intense in the district of Florina between 1904 and 1908.

After Florina was incorporated into Greece in 1912, the Hellenization of the local Slavs progressed rapidly as there was no alternative for educational and ecclesiastical purposes, while the arrival of Greek settlers including refugees from Turkey enforced the already existing Greek or Hellenized element. Nevertheless, a considerable proportion of the Slavic population strongly resisted the processes of assimilation and made the district of Florina one of the very few regions in Greek Macedonia where the presence of a minority created serious problems (31 per cent of the population in the district of Florina are recorded as Slavic speakers in the census of 1928). The Slavic communities of the district of Florina finally disappeared after the Greek Civil War (1946–49), as most of them sided with the leftist Democratic Army of Greece and had to flee the country facing defeat. The rest were completely assimilated to the virtual extinction of Slavic ethnicity in this region of Macedonia where it had been particularly strong. The recent history of Florina demonstrates the effectiveness and success of Greek policies and processes of assimilation.

Food and Drink

The food and drink of Greece show a surprising degree of continuity from classical times, and even before, down to the present day.

Prehistoric evidence comes from archaeology and also from the

Greek language. The Greek names for many plant foods, and for nearly all fish, cannot be paralleled in other Indo-European languages, suggesting that many of the foodstuffs of Greece were unfamiliar to the speakers of prehistoric Greek before their arrival in the Aegean region. But for cereals (emmer, barley, perhaps millet) and for some important food animals (oxen, swine, sheep, goats, ducks, and geese) the names used in Greek are of Indo-European origin, which indicates that the earliest Greek speakers of the region had brought a knowledge of these species with them.

Archaeologists find evidence of the use of deer and wild goats, of tunny, of shellfish and snails, and of a range of fruits and other plants at sites in Greece from about 10,000 BC and even before. Emmer and einkorn (primitive forms of wheat), barley, oxen, swine, sheep, and goats were farmed in Greece and Crete by 6000 BC. In subsequent millennia grapes, accumulates for a range of seafood. By 2000 BC wine and cheese were certainly familiar. Probably olive oil was already well known: the extent of olive cultivation in prehistoric times has aroused controversy, but quantities of oil are recorded on Linear B tablets. Coriander, dill, cumin, fennel, mustard, and parsley are among the early aromatics of Greece. The world's oldest-known man-made beehive comes from Akrotiri (Thera, modern Santorini), demonstrating that domesticated bees were kept there before the volcanic eruption that destroyed the town, and thus that honey was valued as a food.

For Classical and later Greece, literature becomes the main source. Although in the *Iliad* and *Odyssey* there is no evidence of any elaborate methods of cookery, by the 5th century BC a highly developed cuisine was practised in many Greek cities – partly under overseas influence. Some recipes were said to be Lydian (from the rich and civilized kingdom in western Asia Minor) or Ionian (from the Greek settlements in and near Lydia). Others derived from the prosperous Greek colonies in Sicily; Sicilian cooks were famous. Growers of fruit and vegetables developed varieties that varied in quality, time of ripening, and soil and water requirements. Athens, rapidly expanding, depended on imports even for staple foods such as wheat.

The staple foods of Classical Greeks, when leading a settled life, were wheat and barley. At home these were baked into loaves in clay ovens or under ashes; travellers and soldiers probably more often boiled them as gruel or porridge. Poor people supplemented this diet with little more than fruit, mushrooms, and vegetables gathered from the wild. Many could afford to add olive oil and flavourings such as cheese, onion, garlic, and salt fish (e.g. anchovy, goby). On the tables of the wealthy the variety of fish and meat dishes and the many savoury and sweet confections were still typically preceded by wheat

and barley loaves.

Much cooking was probably done out of doors, and took the form of grilling, roasting, frying or boiling over a fire, or baking in hot ashes; *klibanoi*, baking cloches or clay ovens, were used for bread. Cooks depicted in Athenian comedy of the 4th century BC happily list the methods they preferred. At least one cookery book, by Mithaecus, had been written; others would follow. The humorous gastronomic poem of Archestratus, now known only in fragments, shows that travel and trade were encouraging the appreciation of local produce and regional cuisine.

Comedy cooks sometimes list the range of ingredients they would expect to have at hand. These lists include thyme, oregano, fennel, dill, sage, rue, parsley, fig leaf, coriander leaf, and other herbs; raisins, olives, capers, and sumach; onions, garlic, and leek; cumin and sesame seed; almonds; olive oil, vinegar, grape juice; eggs, pickled fish, salt. Favourite kinds of wine, oil, and luxury foodstuffs criss-crossed the Aegean, but the only commonly used ingredients that had to come from far away were *silphion*, the now extinct aromatic from Cyrene; dates from the Levant; *horaion* and other forms of salted tunny, and *garos* (fermented fish sauce), both of which came from the Black Sea ports, as did much of the wheat that Greece imported.

Greeks commonly ate two meals a day, a lighter *ariston* at the end of the morning and a heavier *deipnon* in the early evening. Among the leisured classes, dinner might lead into a *potos* or *symposion* (drinking party). In Sparta and on Crete the typical meal in Classical times was a communal one, served in a public hall. In Athens and other cities private dinners were often held, at which guests reclined to eat, an eastern fashion. At the beginning of the meal a small table, freshly scrubbed, was placed in front of each dinner or of each couch. Food from the serving dishes might be taken directly on to the table, or on to bread, and eaten with the fingers.

An elaborate dinner of the 4th century BC began with the serving of loaves in baskets. A relatively light first course consisted of appetizing relishes, *paropsides*, to eat with the bread. A selection of more generous fish, poultry, and meat dishes formed the main course. Fresh meat was spit-roasted or grilled, and required to be slaughtered and prepared by a professional *mageiros* (butcher-cook) with appropriate religious ritual. Dessert was called *deuteraí trapezai* (second tables) because clean tables were brought in at this point. It consisted of cakes and sweetmeats, cheese, nuts, fresh and dried fruit. Between main course and dessert, wine was first served: it was normally mixed with water. Wines of Chios, Lesbos, Thasos, and the coast of Macedonia had lasting popularity. "Water is best", said Pindar, but the drinking of water "unmixed", without the addition of wine, was

discouraged by many doctors.

Food was a medium of patronage and dependence. The dependants (*parasitōi*) of powerful Athenians and the courtiers (*kolakes*, “flatterers”) of Hellenistic monarchs were fed by their masters, and paid for their food with more or less tangible services. Cities honoured their guests with dinner in the *prytaneion*, a public building containing dining rooms.

The Hellenistic cuisine of the eastern Mediterranean, after Alexander the Great’s conquests, took on a new style influenced by Macedonian, Persian, and other cuisines and customs. Trade within the Mediterranean area continued to grow; crop varieties were exchanged and tested in new environments. New fruits (peaches, cherries, lemons) were introduced from the east; spices began to be imported from Persia, India, and beyond. Thus the Hellenistic menu differed from the Classical Athenian menu in many ways. New kinds of bread became popular, some apparently native to Cappadocia and Syria. Oven-roasting of meat was introduced from the East, allowing the development of large and elaborate stuffed meat dishes, which afterwards became typical of Roman cuisine. Macedonians liked to drink wine earlier in the meal and with less admixture of water (this, some said, killed Alexander).

No sudden change occurred when most of the region became part of the Roman empire. In the arts of luxury Rome deferred to Greece. The cookery of Rome came under strong Hellenistic influence – Greek cooks were in heavy demand – and Latin is full of Greek loanwords for food terms. From Roman times (about AD 200) comes the single most important source text for ancient Greek food and dining, the *Deipnosophists* (“professors of dining” or perhaps “professors at dinner”) of Athenaeus of Naucratis. A second important text (not yet translated into English) is Galen’s dietary survey, *On the Properties of Foods*.

Foreigners

Homer's Trojans are not markedly different in character from his Greeks. As knowledge of foreign peoples penetrated the Greek world, however, increasingly the Greeks came to define their own character in opposition to that of foreign peoples. Pindar spoke of how the man without a wagon was a nomad among the (nomadic) Scythians: the Greeks, by comparison with the archetypally rootless Scythians, saw themselves by definition as city dwellers. The lyric poets of the Archaic age already identified luxurious living and tyrannical government as characteristic of Asia. The contrast between Greeks and "barbarians" and the accompanying sense of a common Greek identity were given a new emphasis in the aftermath of the Persian Wars between the cities of the Greek mainland and the Persian kings Darius and Xerxes (490–479 BC). Herodotus famously encapsulated this common identity by making the Athenians deny a charge of betrayal by pointing to their "sharing the same blood and the same language, with common shrines to the gods and sacrifices, and the same way of life".

The common blood of the Greeks is, among these criteria of Greek identity, perhaps the one given least emphasis in our sources. However, the differences in way of life between Greeks and foreigners are often seen as dictated by innate characteristics. The Greek version of the origins of the monarchy of the Medes, for example, describes how, living in villages with no form of common organization, the Medes gradually turned for the settlement of disputes to the authority of a single man, their future king Deioces, who then imposed his own terms and conditions. The Medes, the story implies, naturally gravitate to a strong leader; the peoples of Asia – by contrast to the freedom-loving Greeks – are natural slaves.

Greek polytheistic religion was, at least overtly, a universal religion. The Greeks equated their own gods with those of foreign peoples, saying, for example, that Dionysus was the Greek name for Osiris or that the Ethiopians worshipped Zeus and Dionysus "alone of the gods". There was no duty of evangelizing in ancient Greek religion. The Greeks could even espouse an ideal that to mock the religion of another people was "madness". However, there were other more subtle ways of distancing the religion of foreigners. Toleration of foreign gods rarely – and only with great caution – led to the institution of those gods' cults. (Though there were "Panhellenic"

sanctuary sites such as Delphi and Olympia, different Greek cities likewise had their own distinct cults of common Greek gods.) Some foreign gods proved untranslatable: the grounds are difficult to discover, but probably include the barbaric nature of their rites. Ironically also the intolerance of other peoples was itself the subject of disapproval. The Persians were (in some instances unfairly) charged with gross acts of sacrilege; a number of stories from the Persian Wars relate, with apparent relish, the come-uppances of the perpetrators of such crimes. The Greek destruction of foreign temples was, by contrast, accidental. The practice of *proskynesis* – probably the blowing of a kiss while leaning forward – offered by the Persians to their kings was inaccurately but persistently believed by the Greeks to represent a form of worship. While the Greeks often saw foreign lands, especially Egypt, as the privileged source of religious wisdom and the land from which (in the distant past) their own knowledge of the gods largely derived, it is noticeable that by their own time they had overtaken the Egyptians in the number of gods in their pantheon.

It was the incomprehensible babble of foreign languages that led to the Greeks terming foreigners *barbaroi* or barbarians. Greeks travelled widely for trade; Greeks served as mercenaries in Egypt in the Archaic period and as administrators and builders in the heart of the Persian empire at Persepolis. But though there must have been Greeks who were fluent in foreign languages, stereotyped caricatures of foreign languages continued; there is also little sign that the ability to speak a foreign language was given any status in the Classical period. The Athenian commander in the Persian Wars, Themistocles, was said to have learnt the Persian language within a year of exile in the Persian court, but there is little suggestion that this was a cause of admiration; rather it seems to have been adduced as another example of his extraordinary cunning. The story, recorded by Plutarch, that a Persian interpreter was killed for daring to express barbarian commands in Greek, is one of a number of anecdotes suggestive of a Greek chauvinism concerning their language. Similar chauvinism attached itself, however, to individual Greek “dialects” – the distinction of language and dialect is essentially a modern one – as to Greek as a whole.

In general also, a sense of national identity by contradistinction to foreign peoples was far less dominant in the ancient world than in the age of the modern nation state. Self-definition could take place as much by opposition to other Greeks, in terms of belonging to a city state (or polis) or to family and kinship groups, as in opposition to “barbarians”. Nineteenth-century historians envisaged Greek history as a failed process of national unification. But though Panhellenism proved a convenient slogan for those resisting Persian conquest or for

Alexander the Great in his expedition into Asia, any such sense of common purpose was fragile.

Forestry

"Forestry" is a term not really applicable to pre-modern Greece. Modern forestry is a specialized art, concerned with growing trees merely as a timber crop. Usually it is done on the basis that trees begin by someone planting them and die when they are cut down. In earlier traditions of woodmanship, in contrast, trees are wild

creatures, arising spontaneously, and many species survive being felled, and sprout from the stump. Modern forestry has been practised in Greece for over a hundred years, but has not come to dominate the landscape nor to supplant earlier, more complex relations between people and trees.

Trees grow in most parts of Greece, but in the drier eastern half of the country they are getting near the limit of their range and grow slowly, especially when close together. By modern standards they often make poor-quality timber: typical Mediterranean oaks are short, hard, crooked, and difficult to work.

In Classical Greece woodland was of rather limited extent and was to be found mainly in the mountains. Then, as now, the abundant trees were evergreen and deciduous oaks, juniper, various species of pine, fir at high altitudes, and (in Crete) cypress and plane. Trees had many uses: besides timber, they provided fuel, stakes for vineyards, leaves to feed animals, acorns, resin, stocks of pear and olive on to which to graft fruit-bearing varieties, oak bark for tanning leather, osiers for basket-making, fruit, drugs, etc. Fodder could be supplied by trees that, because of constant browsing, never grew larger than shrubs, as happens with the common Greek prickly-oak and many others. Firewood and some timber came also from olives and other cultivated trees.

Most trees in Greece other than pines and firs can be coppiced: when cut down (or burnt), they sprout from the base and yield further crops of produce. Regrowth is delayed and hindered by browsing animals. In modern Greece many trees are pollarded (cut at 3 to 4 m above ground) to protect the young shoots from browsing animals.

Ancient Greeks apparently managed their woods, though not by modern forestry methods. On Chios leases written on tables of stone mention coppice-woods attached to farms, which were expected to produce so much weight of wood each year forever, either for consumption on the farm or by way of rent. The quantities, a ton or two per year, were quite small. One clause has been interpreted as meaning that the farm was forbidden to let livestock browse on growing trees, but the text is damaged and the sense unclear at this point. Some big woods had names. The wood Skotitas in the Peloponnese, described by Pausanias, which also had its own god, is still extant. Wood in various forms was regularly imported to islands like Delos that were without woodland.

Athens, giant of Greek cities, was relatively well supplied with woodland, with pine and evergreen oak on Mounts Parnes and Cithaeron and in the Isthmus. Some of it was private property: a list of the lands of condemned criminals, graven in stone in 414 BC, includes an oakery and probably a pinery. Athens was apparently self-sufficient

in wood and charcoal, supplied by professional woodcutters. Demosthenes, for example, mentions a farm where six donkeys were working all the time carrying wood to market. Woodland was probably less extensive and certainly less well grown than it is today.

Attic vegetation fuelled production from the silver mines at Laurium, whose output paid for imports of corn and timber. At a rough estimate, Laurium could have kept going indefinitely on the growth and regrowth of maquis on at most 30,000 ha of land. The Athenians were using perhaps one seventh of their land area as a fuel supply for what was by far their biggest industry.

Timber for shipbuilding or big construction came from far away. According to Theophrastus, the sources were Macedonia (the best quality), the Black Sea, Thessaly, Arcadia, Euboea, and Mount Parnassus (from which came the worst). Other documents and inscriptions record minor supplies from all over the Aegean and even Sicily. Athenian foreign policy had to maintain access to the timber of Macedonia: if the Athenians failed in this they had to do without a fleet. The quantities were not great, for a trireme was a huge, lightly-built racing rowing-boat; but specially long timbers were needed for keels and masts.

Freedom

W.G. De Burgh reiterates a cliché of Classical scholarship when he calls the ancient Greeks "the people who created science, who first grasped the meaning and worth of freedom in thought and action". Denys Haynes echoes the claim that "the relationship between freedom and necessity is the fundamental theme of Greek art", and adds that the idea of human freedom is "the highest achievement of Greek thought, distinguishing it from that of all the other peoples of the ancient world and laying the foundation of our modern Western civilization". Gilbert Murray goes further still, asserting that "of all peoples known to us in history, the Greeks were far and away the freest thinkers", and that (despite China and India) "there is no

philosophy except in Greece or derived from Greece.” In science, art, philosophy, and of course politics ancient Greece (especially Athens) has long been celebrated as the birthplace of freedom.

Recent critics have cited factors that complicate or contradict this traditional picture. The cultural authority of the West, of which Greece is supposed to be the foundation, has itself been called into question. Greek anti-barbarian sentiment is reconceptualized as the prejudice of “orientalism”. Athenian democracy is scrutinized for its exclusions and oppressions (for example, women and slaves). Greek claims to priority in science, and even science’s claims to intellectual pre-eminence, are challenged, in the name of multicultural fairness. In response, defenders of the traditional view insist that the challenges themselves rely on unacknowledged appeal to aspects of the Greek intellectual legacy. Such disputes are made more difficult by the fact that freedom is a complex and contestable concept to begin with. In a brief discussion it must suffice to sort freedom into three rough categories: practical, political, and philosophical. Greek thought and practice have made significant contributions to understanding all three.

Freedom in the practical sense is the power to live as one chooses. This notion of freedom is tied to the idea of self-rule (autonomy). Individuals are *unfree* in so far as their lives are determined not by themselves (that is, by their values, desires, and beliefs) but by what is other than themselves. Since human beings do not appear to be immortal, let alone omnipotent, and since one person’s power must often limit the power of another, this sort of freedom can only be possessed to a degree. One may hope to see such power expanded to more people, to more kinds of people, to more aspects of human life. The intellectual project of expanding human freedom through expanding human power runs from the ancient Greeks down to 14th-century “humanism” and the 18th-century “Enlightenment”, and so on to the present. On the traditional account, Greek rationality was the enabling precondition for the subsequent development of western scientific inquiry; some recent critics, however, view this as naive and ethnocentric. In any event, one human’s power is another’s vulnerability, so the quest for freedom is not merely an intellectual or technological undertaking, but requires adjustment in social forms. Except in ideal circumstances, practical freedom requires social and political support (though the demands of political freedom can be viewed as themselves impinging on one’s practical freedom).

Freedom in the political sense is the power to participate in a suitable way in the processes that determine the political structure in which one lives. Freedom in society requires limits, and therefore the transformation of external constraints into self-rule (*sophrosyne*). By

incorporating aspects of social reality into the self, one can see regulations as expressions of the “civilized” self, which is a creation of the polis. In classical practice, this political conception of freedom can be praised for its natural affinity with notions of democracy, equality, privacy, and individual self-expression, or criticized in view of the restrictions on membership in the polis. To modern readers, Plato’s attack on democracy and Aristotle’s defence of slavery strike sour notes. Whether the cultural achievements of Athens’ golden age “required” the material foundation of slavery on which it in fact relied, and whether such a requirement could serve in any measure to “justify” that society’s abridgement of freedoms, are uncomfortable questions still often debated. Several scholars (for example, M.I. Finley and Orlando Patterson) have suggested that the existence of slavery contributed conceptually to the development of the idea of freedom, which grew out of the very exclusions of Athenian democracy.

If the opposite of political freedom is slavery (and other forms of oppressive dependence), the opposite of philosophical freedom is determinism. The notion of fate or destiny (*moira*) colours early Greek religious thought, and connects to familiar philosophical questions about freedom of the will. Later, Stoic sages advise restricting desire to the sphere in which one is able to exert some control. While one may not have the power to live as one chooses, one can still choose to live one’s life in conformity with the power that one does have. Freedom in this philosophical sense consists of adjusting expectations to the realities of one’s situation; freedom requires acquiescing in necessity. This viewpoint is expounded in Greek by both slave (Epictetus) and emperor (Marcus Aurelius), with enduring influence on western thought. In the koine Greek of the New Testament, St Paul (whom Gilbert Murray called “one of the greatest Greek writers”) adapts the paradox that true freedom consists of acquiescence in being bound by (religious) truth. Paul’s frequent references to himself as the “servant” (*doulos*) of God and of Jesus, along with his exhortation to servants “to be obedient unto their own masters” (Titus 2: 9) – though these are part of the transvaluation of values that Nietzsche would later complain about – help to define a religious notion of freedom for Christianity, which plays a dominant role during the Byzantine period of Greek history and after. This religious version of the philosophical notion of freedom also has metaphysical concerns about the place of human action in a non-human world (ruled by God), and it raises political questions, particularly in connection with the idea of a Christian polity, whether that of an empire, like Byzantium, or that of a quasi-secular, henotheistic nation, such as modern Greece. (Additional religious and political complexities characterize the long interval of Turkish domination and the struggle for independence and

national self-determination.)

The often expressed (but misleading) idea that Greek civilization was “centred on the individual” may serve to unite the three sorts of freedom, for the individual is a participant in the struggle to survive in nature and in society, as well as the subject of that play of power and desire whose rational articulation comprises the substance of philosophical freedom. Some will find the important expression of human freedom in the expansive, pleasure-seeking, Epicurean (even “Dionysian”) approach, while others will hold that a realistic sense of human freedom is best discerned by the restrictive, desire-limiting Stoic (and, in terms of Nietzsche’s influential dichotomy, “Apollinian”) approach. In this sense, the debate about freedom is not likely to reach either an answer or an end, and it may well be that, in the words that E.R. Dodds quotes from T.H. Huxley, “A man’s worst difficulties begin when he is able to do as he likes.”

Furniture

The human activities of sitting, eating, lying down, and storing objects required furniture in the homes of ancient Greece. The development of hierarchic sociopolitical structures in the Bronze Age gave added impetus to furniture development, in the multiplicity of forms and decorative embellishments, as seen in the decorative ivory and gold inlays from the Mycenaean period.

Stationary furniture, such as dining couches, and outdoor furniture, such as benches in a theatre, was often sculpted out of bronze and stone. But furniture construction was generally within the province of carpenters, because wood was the typical material, being relatively lightweight, durable, and easy to fashion. Wood varieties mentioned by ancient Greek authors include maple, beech, oak, willow, cedar, cypress, yew, juniper, poplar, fir, lime, olive, elm, and pine. By the 6th century BC Greek carpenters had most of the possible hand tools for working wood – the adze, axe, saw, plane, hammer, chisel, borer, screwdriver, file, rule, level, plummet, and lathe. Joinery techniques depended on wood constructions of dowel and tenons, socket and tongues, butterfly cramps, and complex mitre joins rather than metal hardware. Steamed bent wood is seen in the chair backs of the 6th and 5th centuries BC. Finishing techniques included veneer, painting with geometric decorations, and oil polish.

The earliest references to Greek furniture are from the Mycenaean culture. The original 13 linear B furniture tablets found in the palace at Pylos in 1939 (now in the National Archaeological Museum, Athens) record elaborate chairs, footstools, and tables made out of stone, crystal, yew, boxwood, or ebony inlaid with ivory decorations depicting cattle, lions, stags, trees, men, shells, and rosettes. Ivory ornaments have been found at several Mycenaean sites that are probably the inlaid remains of such furniture, from which the wood has disintegrated. Additional evidence comes from the miniature, crudely painted terracottas found in graves that portray low, simple beds and three-legged, sling-back chairs. Clay benches were common and found at Pylos, as was a big clay bathtub. A fresco from Pylos shows tall three-legged wooden tables carried by votaries.

Evidence for furniture from the Greek historical period consists largely of literary sources and images on pottery and sculpture, and

consequently, our knowledge is limited primarily to Classical Athens. The types of ancient furniture included chairs and stools, benches, beds and dining couches, tables, and chests. Round metal or pottery oil lamps, which held a wick in the spout, provided light and could be placed on the floor, a shelf, or on tall bronze, single-legged stands. Personal possessions remained few, and clothing simple. Most household objects were stored by hanging them on the wall or placing them in chests (*kibotoi* or *larnakes*) or small boxes. Clothing in particular could be folded flat, since it was made of rectangular pieces of cloth, and stacked in large chests with a top lid. Thrones (*thronoi*) and footstools (*thrinyes*) were manufactured with animal legs, which had been popular in Egypt and Mesopotamia; lathe-turned legs, which become common in Greece only after the 7th century BC; rectangular legs; or solid sides extending to the floor. Thrones had a hierarchic meaning in that they elevated and enlarged the stature of the nobility and, of course, deities. The popular, lightweight chair (*klismos*) with curved back and legs was an extraordinarily graceful Greek invention that was used for domestic purposes; it was easy to lounge in while draping one arm over the back. Four-legged (*diphros*) or folding stools (*diphros okladias*) were also used for seating. Tables, usually three-legged (*trapezai*), were lightweight due to dining customs. Food was carried on these low portable tables from kitchen to dining-room and removed afterwards or pushed under the dining couches so that the space could be used for entertainment. The dining couches (*klinai*), on the other hand, were stationary, often the only permanent furniture in the house, and so could be solidly made and heavy, sometimes constructed of bronze. Eating while lying down was practised in the ancient Near East on waist-high couches, mounted by means of a footstool, but the long bow-curved end of the Assyrian couch was not adopted in Greece. Instead, the Greek couch extended two of its legs higher than the seat to support the arm-rest pillows. Dining couches carried specific social connotations, in that well-born men used them for sleeping or dining. They usually shared a couch with another man or a courtesan. Wives, however, dined in separate quarters, upright on chairs.

G

Galen ^{AD} 129–?208/16

Physician and philosopher

Galen, a prolific Greek physician and philosopher born in Asia Minor (Pergamum), became the dominant influence on European medicine from the Roman empire until the Renaissance. The son of a prosperous architect, he was educated in rhetoric and studied philosophy under Platonists, Aristotelians, and Stoics in Pergamum before taking up the study of medicine. The effects of this early training on his thought and style remain amply visible in the more than 170 fully and partly extant treatises attributed to him (a substantial majority of which are of undisputed authenticity). After continuing his studies under distinguished physicians in Smyrna and Alexandria, Galen returned to Pergamum in ^{AD} 157, where he apparently became a spectacularly successful physician to wounded gladiators. In ^{AD} 162 he went to Rome, returning to Asia Minor in 166, only to be called back by Marcus Aurelius in 169 to serve the Roman imperial court, in whose service he remained thereafter.

Galen attempted to give a comprehensive, detailed account of all aspects of medicine: anatomy, physiology, nosology, aetiology, diagnosis, prognosis, pathology, therapeutics, dietetics, pharmacology, surgery, deontology, ethics, psychology, medical education, medical history, theory of scientific method, and so on. He constantly wove conceptual, doctrinal, epistemological, and methodological links between the different branches of his comprehensive enquiry, thus lending his project the appearance of a systematic, monumental, and scientific whole. Furthermore, he had many impressive prognostic, surgical, and other therapeutic successes (for example, removing a suppurating breastbone and often succeeding where all other practitioners had failed), proving that he was not merely a brilliant theorist but also an accomplished clinician.

Galen's public anatomical demonstrations, at which he dissected and vivisected various animals, appealed to the theatrical sense of a 2nd-century audience attuned to the "display" culture of the Sophists' public declamations. Unlike Herophilus and Erasistratus, he never performed systematic dissections of human cadavers, and his use of comparative anatomy at times led him to attribute non-human features to the human body. His meticulous dissections of monkeys, apes, pigs, goats, etc. (recorded in *On Anatomical Procedures*) nevertheless allowed him to correct numerous observations and

theories of his predecessors.

A voracious reader, Galen eagerly displayed his encyclopedic knowledge of the works of his precursors and contemporaries, and, for the most part, he was unsparing in his criticism of them. Even to Plato and Hippocrates, whom he revered more than all others – and whose views, he argued at length, are essentially in agreement (*On the Doctrines of Hippocrates and Plato*) – Galen at times responded with independence and originality. By constantly incorporating the history of medicine and of philosophy in impressive, if often self-serving, critical detail, he positioned his treatises as superseding all others. An invaluable, if unintended, benefit of this Galenic strategy is that he is an invaluable source for the history of medicine between the Hippocratic Corpus and the 2nd century AD, providing numerous quotations from the lost works of Diodes, Herophilus, Erasistratus, Asclepiades, and others. He likewise preserves significant evidence concerning lost philosophical works (e.g. of Posidonius) and many fragments of Greek poetry.

Galen used his keen philosophical ability to lend his work the authority of a sophisticated logic of scientific demonstration. He viewed medicine as a completable axiomatic science. Any gaps, errors, and inaccuracies in scientific medicine arise, he believed, not from the nature of the medical *technē* itself but from human cognitive or linguistic failures or from quantitative imprecision. His mastery of logic – to which he made original contributions – as well as his teleology and his treatment of many psychophysical questions rendered Galenic medicine appealing to numerous philosophers, too, in subsequent centuries.

Anatomical investigations and physiological experiments provide scientific proof of the providentiality of nature, Galen insisted. “Nature does nothing in vain”: on this point he agreed with Aristotle, but he defended a stronger version of teleology than perhaps any of his predecessors. In his principal work on physiology (*On the Usefulness of the Parts*), Galen attributes the pervasive purposiveness visible in the body to a divine, craftsman-like “Nature”, evoking many echoes of Plato’s *Timaeus* (on which he wrote a commentary). Though reserved on issues such as the immortality of the soul, Galen adapted the Platonic version of a tripartite soul to his anatomical discoveries, locating its three parts in the brain, the heart, and the liver, respectively. From the brain, he argued, psychic *pneuma*, derived from the vital *pneuma* in the arteries, is distributed through the nerves (making sensory and motor activity possible). All the principal physiological activities – respiration, heart-beat and pulse, ingestion and digestion, sensation, and voluntary motor activity – are interdependent and interactive, brought together in a single, coherent,

teleological model. In pathology Galen appropriated the four-humour theory of the Hippocratic treatise *On the Nature of Humans*: the relative proportions of four juices or liquids in the body – phlegm, yellow bile, black bile, and blood – determine health and disease.

The medical authority of Galen's vast corpus was rarely challenged in the millennium after his death. Already in the 3rd century AD he was recognized as surpassing all other physicians. In the 4th century Nemesius, bishop of Emesa, made extensive use of Galen in his *On the Nature of Humans*. Galen's fervent advocacy of teleology made him acceptable to many Christians, and he was admired by a heretical sect, the Adaptionists, who tried to provide a rational, philosophical basis for Christian doctrine, perhaps prompted in part by Galen's criticisms of Christians and Jews. In the mid-4th century Oribasius initiated a long tradition of excerpting and summarizing Galenic texts. Aëtius of Amida and Alexander of Tralles (who was not uncritical of Galen) continued this tradition in the 6th century, as did Paul of Aegina in the 7th. In Alexandria physicians and Neoplatonists alike lectured on Galen throughout later antiquity; the Christian Neoplatonist John Philoponus (AD 490–570s) had high praise for Galen's original contributions to logic and science, as did his contemporary Simplicius.

The Alexandrian iatrosophists of late antiquity selected a canon of perhaps 16 Galenic writings to be read in schools, to be summarized, and to be commented upon. The first four treatises in the canon were *On Sects for Beginners*, *The Medical Art*, *On the Pulse for Beginners*, and *To Glaucón on the Method of Healing*. For the most part, the Alexandrians' selection and sequence do not correspond to Galen's own propaedeutic recommendations, but they became a decisive step in the Alexandrians' scholastic transformation of the Galenic oeuvre into a medical system that was to dominate European and much of Arabic medicine for centuries.

Among numerous other Byzantine writers who drew extensively on Galen, whether directly or indirectly, are Stephanos of Athens (who wrote a commentary on Galen's *To Glaucón on the Method of Healing*), Meletios the Monk, Theophilos Protospatharios, and John (Zacharias) Aktouarios.

A rare Byzantine attempt at refuting Galen occurs in a treatise by the 11th-century scientist Symeon Seth, who was equally familiar with Greek and Arabic traditions. Tensions between Aristotelians and Galenists grew as Aristotle and Galen came to be recognized as the two greatest representatives of a science rooted in logic and in systematic philosophy. Numerous translations, summaries, commentaries on Galen's treatises, and adaptations of his work in a variety of languages (e.g. Latin, Syriac, Arabic, and Hebrew) attest to his stature both in the East and in the West. Even when his authority

began to be challenged, especially after the resumption of systematic human dissection in the early modern period, Galenism remained a powerful force in European medical thought for several centuries.

Biography

Born in Pergamum in AD 129, Galen was the son of an architect. He studied rhetoric and philosophy in Pergamum before turning to medicine. After further study in Smyrna and Alexandria he returned to Pergamum in 157 and went to Rome in 162. Returning to Asia Minor in 166, he was recalled by Marcus Aurelius in 169 and remained in imperial service until his death in 208 or 216. He was a prolific writer on all aspects of medicine; more than 170 surviving works are attributed to him.

Writings

Opera Omnia, edited by Karl Gottlob Kühn, 20 vols, Leipzig, 1821–1833; reprinted Hildesheim: Olms, 1964–65 (the most recent reasonably complete modern edition).
On Anatomical Procedures, translated by Charles Singer, London and New York: Oxford University Press, 1956.
On the Natural Faculties, translated by Arthur John Brock, London: Heinemann, 1916.
On the Therapeutic Method, books 1–2, translated by R.J. Hankinson, Oxford: Clarendon Press, and New York: Oxford University Press, 1991 (includes commentary).
On the Usefulness of the Parts of the Body, translated by Margaret Tallmadge May, 2 vols, Ithaca, New York: Cornell University Press, 1968 (includes commentary).
Selected Works, translated by P.N. Singer, Oxford and New York: Oxford University Press, 1997 (with a useful bibliography).
Three Treatises on the Nature of Science, translated by Michael Frede and Richard Walzer, Indianapolis: Hackett, 1985.

Games and Sports

Influenced by the Minoans, and possibly also by the Egyptians, the Mycenaeans almost certainly engaged in athletic activities. Myth suggests the purposes as honouring a god (e.g. Zeus at the Olympic Games) or a dead hero (e.g. Patroclus' funeral games in book 23 of the *Iliad*) or just as entertainment (e.g. the Phaeacian games in book 8 of the *Odyssey*). By the classical period they were both an essential part of the school curriculum for boys and a pursuit for youths and men of all classes at the public gymnasia and the private palaestrae. The Greek attitude to them is most succinctly encapsulated in the famous phrase of Juvenal (10. 356), *mens sana in corpore sano* (a healthy mind in a healthy body), which does not, however, come from an athletic context. Alexander the Great's subjugation of the Near East in the 4th century BC spread this attitude to non-Greeks, most surprisingly, perhaps, to young Jewish priests who in the 2nd century BC forsook their duties in the temple for the delights of the discus (2 Maccabees, 4. 7–17). Even 300 years after Alexander's more evanescent conquests deeper into Asia, an Indian prince was throwing the discus and the javelin in an especially laid-out area of his palace. Athletic sports did not, however, have much appeal to the Romans, whose gladiatorial atrocities were in turn generally despised by the Greeks.

Although girls, especially in Sparta, participated in some athletic events including on occasion even wrestling, adult women were denied the opportunity. From the 6th century BC all males (except in equestrian events) competed naked, their bodies, to prevent dirt entering the pores, covered in olive oil which was later scraped off with a strigil. Homer describes chariot racing, boxing, wrestling, running, an armed joust, the throwing of a stone and of a piece of metal, and archery. In the classical period the events that comprised the competitions at the public games fell into four groups: running, the pentathlon, fighting, and equestrian events.

Apart from relay races with a torch for a baton, which were rather part of religious cult than athletically competitive, there were four running-races: the *stade* and the race in armour were one length of the

stadium and the *diaulos* two, while the *dolichos* was a long-distance race. As the lengths of stadia differed, so did those of these races, but they approximated to a furlong (200 m), a quarter of a mile (400 m), and three miles (4.8 km) (the marathon is a modern commemoration of Phidippides' run from Marathon to Athens to announce the victory over the Persians in 490 BC). The *stade*, the original event in the Olympics, traditionally founded in 776 BC, carried the most prestige. In all races runners first started, at the sound of a trumpet, from a *gramme* (scratch-mark) in the sand, but in the 6th century BC this was replaced by a *balbis* (stone sill) with grooves for the toes, to which was added in the 5th century a *husplex* (starting gate). This last was operated by a man behind the runners releasing simultaneously cords which were attached to horizontal bars on vertical posts in front of each runner (the remains at Isthmia provide the best archaeological evidence). Turning-posts were used in the *diaulos* and *dolichos*, but it is not known if each runner had his own post or if, more likely, they all turned round the same post. There was no finishing-tape, and if the judges could not distinguish a winner a rerun was held. Heats were used when more than the 16–20 runners that the varying widths of stadia could accommodate competed.

The pentathlon, first devised probably for the Olympic Games of 708 BC, comprised five activities: a jump, a discus throw, a javelin throw, a *stade* race, and wrestling, for the first three of which there were no separate competitions. The winner was the first athlete to win three events: running and wrestling presumably took place only if no clear winner had already been determined. Despite the pentathlon's popularity on vase-paintings, Plato's comment (*Amatores* 135e) that it was the opportunity for the second-rate athlete, and the small prizes for winners known from the Hellenistic period, suggest that it ranked low in prestige.

The jump was performed to the sound of pipes as a rhythmic aid by athletes who held *halteres* (jumping-weights) of 1.8 to 3.6 kg in their hands. Since the only three recorded distances are between 15 and 17 m, the jump is most likely to have been a multiple jump, perhaps the modern hop-step-and-jump or triple jump which was introduced as an interpretation of the ancient event. Aristotle claims (*De Incessu Animalium* 705a17) that the athletes jumped further with *halteres*, and modern athletes have found that weights can improve distance in the long jump (and, if they are released, even in the high jump), but it is difficult to see how this could be possible in a multiple jump unless they were released in the first segment. The evidence of both literature and vase-painting, however, points unanimously to their retention.

The discus was usually made of bronze in the Classical period.

Surviving examples vary in diameter from 16 to 34 cm and in weight from 1.3 to 6.8 kg. Although the athlete threw forwards from an area demarcated in front and at the sides, and could consequently make a preliminary run, he is unlikely to have done this. Vase-paintings and sculptures show reversed feet, probably indicating at least a partial turn of the body, and a rope-like pull with the right arm. The only recorded throw is of 29 m.

The javelin was generally made of cornel wood tipped with bronze. It was thrown, after a run, by an athlete holding it roughly horizontal above his head, with a thong wrapped round the shaft and looped over the first or first two fingers of the throwing hand. This perhaps gave added leverage, but certainly enabled the javelin to spin on its own axis, thus being steadier in flight and, in its military equivalent, boring into its target like a bullet. It had at least to nick the ground on landing.

The three fighting events were wrestling, boxing, and the *pankration* with no weight divisions, rings, or rounds. Judges attended the fights and beat with canes those who infringed the rules. The longevity of some fighters was remarkable: Milon, a boxer from Croton in the 6th century, must have been a champion for at least 21 years since he won six Pythian crowns (and five Olympic). Weightlifting must largely be considered as a form of training for these fighting events rather than as a sport in its own right.

Wrestlers, who had to make their opponents' shoulders touch the ground three times in order to win, were not allowed any leg-holds, although their legs could be used to sweep opponents off the ground. Vase-paintings and sculptures show numerous holds, upon which the modern Graeco-Roman style is based.

The aim of the boxer was to incapacitate his opponent (there are only two recorded deaths, both the result of fouls), or to force him to submit by raising an index finger. As was probably the case in Minoan boxing, the head was the sole target, and vase-paintings frequently show boxers (always right-handed) with head held back and chest thrust forward. In the 1st century AD a remarkable athlete from Caria named Melancomas displayed a completely different technique by skipping out of the way of his more ponderous opponents until they gave up in exhaustion. He is reputed never to have been hit and to have engaged in one bout that lasted two days. In training, shadow boxing was practised and fighters wore ear-guards and, to avoid hurting each other excessively, padded gloves, but in competition they bound *himantes* (thongs) round the knuckles for self-protection: the nickname *murmekes* (ants), applied to these *himantes*, indicates how they stung.

The *pankration*, which had the same aim as boxing, was a fight in

which everything was allowed except gouging and biting. To judge from the number of poems commissioned from Pindar by pankratiasts and the magnitude of Hellenistic prizes, this was an event which both carried considerable prestige and appealed to the upper class.

Chariot-racing was for aristocrats, owners rather than competitors receiving the prizes. Despite the pride of place given to it by Homer, it did not feature in the Olympic Games until the 25th celebration in 680 BC. Light chariots were pulled by teams of two or four horses, or two mules or two foals, completing up to 12 laps between two markers. Hippodromes varied enormously in size from about 275 m to one in Athens that allowed a race of about 1.6 km without a turn. At Olympia the track was about 550 m long, and at the sound of a trumpet a rope barrier across stalls set in a convex line was removed in such a way as to give all teams a fair start, each driver having a flying start on his inside rival. Over 40 teams are known to have taken part in a single race. Bareback riding was far less popular, but appeared at Olympia as early as 648 BC.

Although not recommended by medical practitioners, most Greeks could swim according to Herodotus (8. 89), who attributes the large number of survivors from the Battle of Salamis in 480 BC to this fact. The 6th-century Sicilian Olympic boxer Tisander used long-distance swimming for training. References are found to both breaststroke and front crawl, while beginners had the help of cork lifebelts and a fresco of the 5th century BC from Paestum shows a youth diving from what appears to be a diving-tower. There is literary evidence for occasional swimming races, while regattas for rowing were certainly held in the Imperial period.

Ball games were apparently aimed at healthy exercise (in the 2nd century AD Galen, in his *De Parvae Pilae Exercitu*, is particularly enthusiastic) and pleasure rather than serious competition, but they were important enough to form the subject of a lost treatise by the Laconian Timocrates (Athenaeus, 1. 15c). Homer describes Nausicaa and her attendants throwing a ball to each other, a late archaic bas-relief from Athens depicts what looks like a bully-off in hockey between two players while others with curved sticks look on, another bas-relief shows a throw-in in a team game, a black-figure vase shows a game in which an old man leaning on a stick is throwing a ball to three pairs of youths piggyback in front of him, a 5th-century relief has a youth bouncing (or balancing) a ball on his thigh (Spartan youths in the Roman period played a ball game with teams of 14 a side), and in the 2nd century AD Pollux describes (9.4) the game of *episkuros* that sounds a little like rugby football without any kicking.

Other games included hoop bowling (for youths as well as children), marbles, and, for the more sedentary, dice, knuckle-bones, and

draughts, which last was played on a board of 36 squares with a “sacred line” down the centre to separate home from enemy territory. The most frequently mentioned game is *kottabos*, in which inebriated symposiasts, while reclining on their left elbows, threw with their right hands the last drops from their wine cups at varied targets such as saucers floating in water and objects that could fall when struck.

Gardens

Finds of plant pots of clay or faience with holes at the base attest to the cultivation of flowers or herbs in the Aegean area in the 2nd millennium BC. The art of the Mycenaeans shows a persistence of floral motifs which is probably due to the non-Greek but associated and culturally influential Minoans, in whose frescos, glyptic art, metalwork, and painted pottery floral landscapes figure prominently. Although there is as yet no evidence that the Mycenaeans actually cultivated pleasure gardens, it is probable that the Minoans, under Egyptian inspiration, may have done so. A restored fresco of the Middle to late Minoan period from a villa at Amnisos northeast of Knossos appears to show lilies arranged in a formal setting reminiscent of a garden. Excavation suggests the possibility of terraced gardens leading off porticoes in some Minoan palaces. At Phaestus in central Crete a rocky outcrop in the southeast area of the palace was not only cut back but also furnished with round holes, most likely

once filled with soil and planted with flowers to create a tiny garden for the associated court and portico. The flowers in vases depicted in several frescos are, however, probably not growing but cut and wild.

The epics attributed to Homer, which frequently reflect the culture of the dark age rather than the preceding Mycenaean period, contain descriptions of gardens. Although these are mainly kitchen gardens and orchards providing grapes, olives, figs, apples, pears, pomegranates, and vegetables, there is also mention of groves associated with the shrines of gods and the graves of heroes. The almost lyrical delight in the beauties of nature shown in these poems is in sharp contrast to the harsh realities of practical agriculture in the roughly contemporary *Works and Days* of Hesiod.

Private gardens in the Classical period were again almost entirely utilitarian, even flower gardens having profit as their primary purpose in the sale of their produce for garlands. Unlike the situation in the Persian and the later Roman empires, horticulture and even agriculture were not considered gentlemanly pursuits in Greece. Urban houses were simple and small with no surrounding land but a central courtyard that rarely measured more than about 50 square metres, was usually paved, often contained a well and an altar, and served for many everyday domestic activities: it could have accommodated at best only a few potted herbs. The sole common private nonutilitarian gardens were the so-called Gardens of Adonis, but these were merely pots of fast-growing plants that died quickly and thus symbolized the life and death of the divine Adonis.

Public gardens in the Classical period were largely groves of trees (especially cypress, plane, and laurel) around shrines and were chosen for cultic reasons and to give shade. These sanctuaries sometimes also included stands of trees and fields of crops for commercial purposes. Two of the best-known groves were at the shrines of Aphrodite outside Athens and of Zeus and Aphrodite at Cyrene. The only one hitherto excavated surrounded the temple of Hephaestus in the Athenian Agora, but its date is as late as c.300 BC. Excavation of square pits dug into the bedrock indicates two straight rows of shrubs or small trees on three sides of the temple and small flowerbeds against the precinct wall. The pits contained deliberately broken pots used for the method of propagation known as layering by circumposition. Groves were planted also at gymnasia, which were themselves often associated with sanctuaries. Such is the origin of the schools of Plato and Aristotle, the Academy and Lyceum respectively, which set the pattern for later philosophical gardens, most notably that of Epicurus, which he left at his death to Athens as a public park.

The changes in the Hellenistic period are primarily due to two factors: the creation of new cities, most notably Alexandria in Egypt,

enabled a more generous disposition of buildings with extensive open areas available for sanctuaries and public parks; and the substitution of autocracy for democracy or oligarchy encouraged rulers to spend public revenues on grandiose works that enhanced their prestige, these works including gardens in imitation of oriental monarchs. The most outrageous of these works was a ship designed by Archimedes in the 3rd century BC for Hieron II of Sicily that included a gymnasium with bowers of vines and numerous irrigated flowerbeds, while in the 2nd century Attalus III of Pergamum grew drugs on the deck of his flagship. Terrestrial parks often had artificial grottoes, fountains, sculptures, and an increasing range of plants, an interest attested by botanical treatises such as those of Theophrastus. Private homes, although often larger and more luxurious than earlier because of an increase in wealth, still tended not to include gardens, the central courtyard being often floored in mosaic.

Gardens in the Greek world under Roman rule were Roman in inspiration. The paved Greek courtyard became a peristyle garden with artistic fountains and formally arranged shrubs and flowerbeds. When space was cramped, roof gardens were created and walls were painted in the verisimilitude of gardens complete with birds. Grandees owned numerous villas that were single entities incorporating buildings, porticoes, terraces, arbours, shrubberies, and flowerbeds and occasionally included even a game park. Landscaping, topiary work, sculptures, elaborate fountains, grottoes, and fish ponds all became regular features and garden dining rooms were not uncommon. All cities boasted public parks and temple gardens. Excavation, especially around the Bay of Naples, has revealed a vast amount of information.

Gaza

City in Palestine

Gaza, on the route from Egypt to Palestine and situated a few kilometres from the sea, and its port, Maiuma, have a long history. Gaza appears in the Bible as a centre of the Philistines. Hellenization began after the city was captured by Alexander the Great in 332 BC. It was ruled by the Ptolemies, and destroyed by the Jewish ruler Alexander Jannaeus in 96 BC, only to be rebuilt by the Roman governor Gabinius on a new site. It received Roman settlers when it became a Roman colony in the reign of Hadrian, perhaps in AD 129. The city worshipped Greek gods, but these were probably Semitic deities whose names and cult had been Hellenized. This is clear in the case of Zeus Manias, the principal god of the city. As late as 395 the majority of Gaza's inhabitants still adhered to paganism.

Gems and Seals

The use of seals fashioned from engraved semiprecious stones (normally cornelian and other quartzes) has a long history in Greek lands. Their primary purpose was to secure valuable commodities with a mark of ownership or to guarantee the authority of a letter or contract. They comprise much of the best miniature art produced

during the Aegean Bronze Age and over a period stretching from Archaic Greece to Roman times, and were certainly valued for their artistry. Apart from the gems themselves, clay sealings survive from destroyed archives such as those of Hellenistic or early Roman date at Delos, Edfu, and Cyrene. Only from the 4th century AD did it become the custom in the Byzantine empire to affix to documents and packages double-sided sealings, normally of lead and made with a pincer-like *bulloterion*.

Seal motifs used in Cretan palaces of the 2nd millennium BC, such as Knossos, were generally engraved on one side of a pierced head which could be worn on a string around the wrist or neck. Subjects comprise much of the standard repertoire of Minoan art, including marine creatures, bulls, and ritual scenes, such as the bull-leaping attractively rendered on an agate flattened cylinder (Ashmolean Museum, Oxford). Seals are quite common as finds and there are also many examples of sealings fired in various conflagrations, which attest to the highly organized and bureaucratic nature of Bronze Age society. The use of seals spread to mainland Greece, and fine examples are recorded from all the major sites, including Mycenae, Tiryns, and Pylos. The collapse of high culture, and with it the decline of literacy, at the end of the 2nd millennium BC brought the use of seals to an end.

From the 9th century BC there was a tentative revival of seal-cutting on the Greek mainland, though the stamp seals that were produced are rather schematically carved, on ivory or soft stone. In the 7th century BC seals of much higher aesthetic quality, often imitating Minoan prototypes, were engraved in the Cyclades. The major revival in gem-cutting came only in the second quarter of the 6th century BC when the Greeks adopted the Egyptian custom of carving seals in the form of scarab beetles. These were worn on a swivel-ring, and the devices engraved on the undersides of these archaic scarabs were thoroughly Greek in character from the start, sometimes orientalizing in style. Popular subjects include satyrs, warriors, lions, and winged figures such as the “mistress of the animals”. From about 500 BC the use of the scarab back was largely abandoned and the devices on seals of scaraboid form became more naturalistic, as can be seen in the case of a gem signed by the engraver Epimenēs showing an ephebe restraining a horse (Museum of Fine Arts, Boston).

Scaraboids of the 5th century BC are generally larger, and often made of a beautiful grey-blue chalcedony. Classical artists tried to imitate nature meticulously, whether the subject was a nut, a sandal, or an erotic scene. There are many delightful vignettes of animal life, including two studies of herons carved by Dexamenos of Chios (both in the Hermitage, St Petersburg). The same engraver carved a bearded male head (Museum of Fine Arts, Boston) and a delightful scene of a

lady with her maid (Fitzwilliam Museum, Cambridge). During the Classical period the use of Greek-style seals spread in the western satrapies of the Persian empire and far beyond, many Graeco-Persian gems depicting figures in Persian costume and mounted hunts carved in an unmistakably Greek style.

Rings with fixed bezels became usual in the following century and were normal in Hellenistic and Roman times. From the time of Alexander the Great the Greek tradition of gem use was spread throughout the eastern Mediterranean area and, indeed, as far as India. A Hellenistic portrait of Alexander in the Ashmolean Museum, Oxford, bears an inscription in an Indian language. Moreover it is carved from tourmaline, demonstrating that rarer stones from the east were now available. The typical Hellenistic medium was perhaps garnet obtained from the western Himalayas. The changed nature of society is reflected in Hellenistic glyptics, many seals now showing the portraits of Ptolemies, Seleucids, and other rulers, although deities and genre scenes were always more common.

The incorporation of the Greek world into the Roman empire did not mark any real break with the Hellenistic tradition. The Greek style of gem usage had entered northern Italy as early as the Archaic period, and although the Etruscans and other peoples clung to the scarab back for longer, Greek influence from Magna Graecia and beyond continued to be felt, not least in Latium. By the beginning of the 2nd century BC important Romans were commissioning the best Greek engravers. The emperor Augustus (27 BCAD 14) employed the great Dioscurides for his signet, as we hear from Suetonius, Pliny the Elder, and Dio Cassius. A number of gems from his hand are extant, including a Hermes (Fitzwilliam Museum, Cambridge) and Diomedes stealing the Palladium from Troy (Devonshire collection, Chatsworth).

Among the many gems from Greek-speaking lands in the empire, a special class of gems cut with figured devices and/or magical texts on both sides was widely distributed, especially in the Levant. These could be used in gems as seals but served mainly as amulets. Otherwise, while the occurrence of the Greek language or a Greek name on an inscribed seal indicates a Greek-speaking owner, the style and subject of "Roman" gems from Scotland to Syria are very similar, demonstrating the dominance of the Greek tradition in this medium.

During Hellenistic and Roman times gems were used in all manner of jewellery, especially by women. Even engraved gems were sometimes simply used decoratively in brooches and rings, especially in the case of cameos, gems carved in relief. The best were works of art, cut in the workshops of Dioscurides and his contemporaries, though others were mass-produced, often love-tokens given by men to their girlfriends. Of special interest here are those of the 2nd- or 3rd-

century AD carved with Greek mottoes, found not only in Greek lands but as far away as Roman Britain.

Gender

In this essay, the term “gender” is to be understood as the social and cultural, as opposed to biological, identification of a person’s sex, and the distinctions between the sexes.

Though a social construction, gender nevertheless has its ideological roots in biological differences, real or imagined, between the sexes. This is presented most clearly by the 5th-century-BC doctor Hippocrates, who wrote in his *Diseases of Women* (trans. A.E. Hanson, quoted in Halperin):

I say that a woman’s flesh is more sponge-like and softer than a man’s: since this is so, the woman’s body draws moisture both with more speed and in greater quantity from the belly than does the flesh of a man ... And when the body of a woman – whose flesh is soft – happens to be full of blood and that blood does not go off from her body, a pain occurs, whenever her flesh is full and becomes heated. A woman has warmer blood and therefore she is

warmer than a man. Because a man has more solid flesh than a woman, he is never so totally overfilled with blood that pain results if some of his blood does not exit each month. He draws whatever quantity of blood is necessary for his body's nourishment ...

Women are therefore bound to bleed, notably at liminal points of life: menstruation, defloration, and parturition; it is an essential aspect of the prime female role as giver of life. By contrast, it is the man's duty to bleed in warfare, which was understood by the ancient Greeks as the male counterpart to female parturition. Thus Euripides' Medea proclaims that she would prefer to face battle three times rather than give birth once (*Medea*, 250ff.), and the laws of Lycurgus allow marked burials only for men who died in battle and women who died in childbirth (Plutarch, *Life of Lycurgus*).

This dichotomy of the "soft, weak" female and the "strong" male pervades all aspects of the Greek understanding of gender distinctions. Since the female is weak in will and body, excess and temptation have received feminine attributes. In ancient Greece feminine deities personified strife (Eris) and madness (Lyssa), while in the Byzantine era sins acquired feminine personifications (Neophytos Enkleistos). Nevertheless, this weakness also counteracts the high potential for destruction and disruption, and the feminine is seen to be essentially *passive*, unable to exert active control over the self and often considered to be childlike.

By contrast, the male is understood to be strong in body and mind and is essentially *active* in character. As the strong body makes men fit for warfare, strength of mind gives them the potential for self-restraint, in Greek *sophrosyne*, or temperance. Thus the male is expected to control his appetites for food, drink, and sex along with overweening pride and anything else considered to be excessive (Aeschines, *Against Timarchus*). The male is in active control, stable and competent, while the female is passive but dangerous. This conception of male and female genders has changed little if at all since ancient times.

While the ideology of the strong, active male and the weak, passive female remains constant in Greek culture, there are various inversions of these roles, when men become "as women" and vice versa. In early Greece gender ambiguity is represented by Dionysus, god of wine, madness, and liminality. In the *Bacchae* he is described as fair-skinned, long-haired, and luxurious, and since he is feminine he also causes the youth Pentheus to adopt transvestitism. From the 4th century BC vase painters show Dionysus as beardless. Even greater gender ambiguity occurs with Heracles. While ultimately masculine in his superior

strength, Heracles is forced into the feminine role throughout his career. On one occasion he must serve the Lydian queen Omphale, wearing her clothes and spinning thread at her feet, while she bears his cloak and club. In *Trachiniae* (1070ff.) suffering in his death, Heracles proclaims himself turned into a woman. As there are feminine men, so too are there masculine women in the Greek tradition, notably the maenads and Amazons, both of whom represent inversions of the “natural” order of society and civilization in the ancient Greek arts.

Beginning in the Byzantine era eunuchs also upset the engendered order. Contemporary views varied on the extent to which eunuchs represented a “third sex”. The secular opinion was that eunuchs were neither male nor female, but other, while Theophylaktos of Ohrid (12th century), providing Church commentary, argued that they were “neither a third sex nor a third gender; they are simply men” (S. F. Tougher, in James, 1997, p.169). Nevertheless, physical and sexual differences were recognized in eunuchs; Theophylaktos himself noted that sexual purity was their inherent benefit (*ibid.*, p.175); they had feminine voices, glossy skin, and corpulent physiques (Hopkins, 1978, pp.193–94); and the 10th-century Arab historian al-Masudi mentioned that their armpits did not smell (Masudi, 1989, pp.345–46).

Male homosexuality in ancient and modern Greece presents its own subversion of masculine gender. In ancient Greece the man was expected to be the *erastes*, the active lover. Only the female should be able to enjoy sex passively (*eromenos*), and the male who did so was given the derogatory epithet *kinaidos*. In modern Greece male homosexuality is regarded as the union of an active, extra-masculine male and a passive, feminine one known as the *poushtis* (Loizos and Paptaxiarchis, 1991, p.227). The latter is often regarded as subhuman, being of weak moral character and without dignity (*ibid.*, pp.227–28). A lesser, although more commonly heard, insult of the male through likening to the female is the term *malaka*, meaning “soft”. It carries inherently feminine overtones, and ranges in insult from casting aspersions on the masculinity of the term’s recipient to verbally placing the recipient in the role of the *poushtis*. As in most modern, Western cultures, there is no corresponding insult likening the female to the male.

In all periods of Greek history the house interior is feminine space, while the outdoors, the city or farm, is the realm of the man. The white paint used to render females in Bronze Age and classical art in contrast to the red or black pigments used to colour men has mostly been attributed to this dichotomy. In modern Greece the house is still the proper domain of the woman (A. M. Iossifides, in Loizos and Paptaxiarchis, 1991, p.141), and the respectability of (unmarried)

females is often dependent on claims of “never leaving the house”. By contrast men are expected to remain outdoors (J. K. Cowan, in Loizos and Papataxiarchis, 1991, pp.187ff.), either working in the fields or the city, or relaxing in male company at the *kafeneion* (one humorous aspect of modern Greek village life is the social impropriety of men going home during the day; on slow days they have little choice but to remain at the *kafeneion*).

While interior space is feminine and the civilized outdoors masculine, wild, uncultivated territories are seen as feminine. In the pagan tradition this area is sacred to Artemis, and it is to these regions that the maenads flee when possessed (Euripides, *Bacchae*). Unfortunately, little such territory remains in modern Greece.

Geography

Although the Greeks were the creators of the science of geography and made considerable advances in mathematical and descriptive geography, they were hampered by the lack of good technical appliances and therefore could not obtain technical accuracy. Only a fraction of the world was actually known to them, and what was unknown was the subject of a priori deduction and fanciful speculation. With the exception of mathematics and astronomy, Greek geography did not as a rule rely on other sciences as does geography today.

A considerable appreciation of topography, world order, and theory is displayed in the various Homeric descriptions, some of which are quite elaborate. The catalogue of ships in book 2 of the *Iliad* is a

systematic evocation of the homeland of the Greeks. Both Homer and Hesiod conceived the earth as a round land mass surrounded by Ocean and symmetrically vaulted by heaven above and Tartarus below.

It was among the Ionians of Asia Minor that Greek geographical enquiry and writing originated, and their geographical horizons were enlarged by the expansion of their commerce and the colonization movement. In choosing names for their new settlements they repeated place names from their homeland, a habit of thinking which reflects a geographical sophistication. Not only is this practice paralleled from other parts of the world and other ages, but the practice persisted among the Greeks themselves down to Hellenistic, Roman, and even modern times.

The first recorded attempt at drawing a map of the world is that of Anaximander of Miletus (6th century BC). This map probably represented the world as a circular land mass divided into two portions, Asia and "Europe", surrounded by Ocean as Homer described it. The map was corrected and enlarged by Hecataeus (530–490 BC) who also wrote a commentary on it (including descriptions of towns and peoples as well as geographical features), of which some fragments are preserved by Herodotus. Herodotus (traditionally 484–425 BC), the "father of history", carefully recorded his personal observations made during many years of extensive travel, thus combining the geographical and ethnographical perspectives. Following his example, almost all ancient historians regularly included geographical descriptions in their works, and many of them appreciated, though perhaps not adequately by modern standards, the impact of geography on historical events. Ephorus (c.405–330 BC) attempted ethnography and historical geography and devoted entire books to descriptive geography, while Timaeus (c.350–260 BC) dealt largely with the general geography of western Europe.

Meanwhile, the shape and nature of the earth itself was engaging the attention of the early Greek philosophers. Of the Milesians, Thales (c.625–547 BC) declared it to be like a log floating on water, Anaximander that it was cylindrical and that it remained steady due to its central position in respect to other heavenly bodies, Anaximenes (c.380–320 BC) that it was like a leaf floating in the air. By insisting that the earth had no limit below and that the air had none above, Xenophanes (c.570–478 BC) got rid of both Uranus and Tartarus. The sphericity of the earth was asserted by the Pythagoreans, referred to for the first time in extant literature by Plato (in the *Phaedo*), and proved by Aristotle and Eudoxus of Cnidus (c.400–347 BC). The last mentioned is also responsible for the division of the globe into five zones: one of torrid and two each of frigid and temperate climate. Heraclides of Pontus (388–315 BC) declared that the earth revolved

round its axis, and Aristarchus of Samos (330–260 BC) believed that it might also be revolving round the sun (prior to this, the Pythagorean Philolaus had taught that the earth, together with the planets, revolved around a central fire).

The earliest surviving work of a purely geographical nature is a description of the Mediterranean coast, the so-called *Periplus of Scylax* (named, doubtless, after Scylax whom Darius sent to explore the Indus), in reality a work of the early 4th century BC. About 330 BC Pytheas of Massilia made his voyage of exploration towards the northwest as far as the northern end of the British Isles and the coasts of Germany.

At about the same time, the eastern campaigns of Alexander the Great opened to Greek research the whole of Asia as far as India, with prospects of further expansion. The work of his companions and followers served, more than anything, to establish a link between formal geography and political dominion. Moreover, through the development in their hands of the ethnographical tradition, these writers gave to geography an analytical content which, while relying on the techniques of description and cataloguing, outlasted them. Thus Nearchus' report on his voyage from the Indus received visual form in a new map by Aristotle's pupil Dicaearchus of Messana (c.320 BC). He was the first writer to treat physical geography in a scientific manner. Though his estimate of the earth's circumference (40,000 miles) was exaggerated, he rightly assumed the existence of a southern hemisphere. His map remained the standard of its kind for a long time.

The southern and eastern parts of India were opened up even further under Alexander's successors, as a result of Seleucid military expeditions and the trips of ambassadors such as Megasthenes. Unlike Ctesias of Cnidus (c.400 BC) whose *Indica* has been criticized as being overloaded with fable, Megasthenes has been commended (though not without debate) for giving a good description of the Ganges valley, of which he had personal knowledge. The Arabian and East African coasts became better known as a result of the commercial expeditions of the Ptolemies, and this improved knowledge is reflected in Agatharchides' partially extant description of the Red Sea coast (c.120 BC) and in the geographical chapters of Diodorus Siculus (c.100–20 BC).

It was Eratosthenes of Cyrene (c.285–200 BC) who arranged into a truly scientific system the mass of geographical material collected up to his time. He rejected the Homeric tradition and insisted on a clear distinction between fictitious wonder-descriptions and the recording of scientific fact. He created a new genre by blending mathematical and descriptive geography. His achievements in mathematics and the physical sciences on the one hand and history and philology on the

other equipped him ideally for his task. He was the first to attempt to estimate the earth's circumference by a measurement of degrees carried out over a space of 15 degrees of latitude, but the imperfections of his method caused him to arrive at an exaggerated estimate (by 15 per cent or less) of 25,000 geographical miles. But the estimate which came to be accepted for many centuries to come was that of Posidonius of Apamea (c.90 BC) who based his calculation on the measurement of the shortest distance from Alexandria to Rhodes, and arrived at a figure of 18,000 geographical miles.

The true founder of mathematical geography was Hipparchus of Nicaea (c.140 BC), for he applied geometrical length and breadth to determine the position of places on the earth's surface. He also replaced the then current (Eratosthenean) rectangular and equidistant projection of parallels and meridians with a projection approximating to modern usage. He represented the parallels by segments of a circle, and the meridians by straight lines or curves in keeping with the portion of surface to be represented, drawn at distances corresponding to the actual distances on the surface of the globe.

The most important surviving Greek work on descriptive geography and ethnology is the 17-book treatise of Strabo published around AD 20. It covers topography as well as physical, political, historical, and (with less enthusiasm) mathematical geography. His object was the edification of political and military leaders. Roman conquests enabled him (as they enabled Polybius and Posidonius) to give a more accurate description of the West than his predecessors. The first two books present a wide-ranging discussion of the aims and methods of geography and review earlier writings on the subject. The remainder is devoted to regional geography. The vanished writings of many of his predecessors are known to us mainly through his criticisms.

The geographical contribution of Claudius Ptolemy (mid-2nd century AD) was the concept of the tabulation of latitude and longitude of places, which could give precision to locations. Its defects are due chiefly to the inaccuracies in his data and his preference for a priori principles over data available from recent reports (which must have included works such as the anonymous *Periplus of the Erythraean Sea*, a work probably dating from the second half of the 1st century AD and preserved, with other minor geographical works such as the epitome of Strabo, in a 9th-century Heidelberg manuscript). Though most of Ptolemy's geographical data were not actually determined by astronomical observation, he expressed them systematically in reference to curved lines of latitude measured northwards from the equator and curved meridians measured eastwards from the Canary Islands. The special topographical features of Greece were served by Pausanias' *Guide to Greece*, while the didactic geographical hexameter

poem of Dionysius Periegetes (2nd century AD) acquired so much popularity down the ages that it was translated into Latin by both Avienus and Priscian, paraphrased by Nicephorus and an anonymous writer, and was commented on by Eustathios, the 12th-century bishop of Thessalonica.

Greek geographical writings after Ptolemy largely consist of compilations and extracts, such as the *Periplus of the Outer Sea* by Marcian of Heraclea (c.AD 400) and the *Anonymi Geographi Expositio Compendiaria* attributed to Agathemerus. Both these works were printed by C. Müller in the first volume of his *Geographi Graeci Minores* (1855). Towards the end of the 6th century Stephanos of Byzantium compiled a dictionary known as the *Ethnica* which has preserved a great quantity of geographical information from earlier writers now lost, and which was in its turn utilized by the emperor Constantine VII Porphyrogenitos in his *De Administrando Imperio* and *De Thematribus* which include historical and ethnographic data. Stephanos's main sources were Strabo and Pausanias. Cosmas Indicopleustes, an Egyptian merchant turned monk, wrote the 12-book *Topographia Christiana* in which he made a vehement attempt to disprove the pagan theory of the earth's sphericity, maintaining that the shape of the world was the same as that of the tabernacle which Moses built to house the Covenant.

Geology

Our knowledge of the geological history of the Aegean region starts in earnest 200 million years ago. At that time the North Atlantic Ocean did not exist and both Africa (more correctly Gondwanaland, or Africa plus other continents) and Eurasia (Europe and Asia) were united with the North American continent to form a supercontinent named Pangea. Between the future continents of Africa and Eurasia there was a wedge-shaped ocean, named Tethys (after the daughter of the earth goddess Gaia), which opened out to the east, where it joined the other oceans. The southern part of Tethys was a wide, shallow tropical sea where limestone was being deposited, rather similar to the Bahama banks today. Much of the grey limestone seen today in Greece formed at this time. Low islands on this platform were later to form parts of the mountains of Macedonia, Thrace, and southwestern Turkey. The northern part of Tethys was a deep ocean basin that abutted mountains in southern Eurasia. This state of affairs changed when the North Atlantic Ocean began to form about 190 million years ago.

The Atlantic Ocean started to open from the south and a great tear extended northwards. Africa had to rotate anticlock-wise to accommodate the new ocean and the Tethys Ocean started to close up. At the same time, between the wide platform where the limestone was forming and the core of the African continent, a new ocean was opening up, later to become the Mediterranean Sea. These two processes combined to force the limestone platform, with its islands and troughs, northwards towards Eurasia. The deep ocean floor could bend and descend into the deeper parts of the interior of the earth, but the islands and the platforms were too light to go down. Instead they were piled against Eurasia to form chains of mountains. The overall convergence between Africa and Eurasia slowed down after the Arabian peninsula hit Eurasia, but continued expansion of parts of the Mediterranean sea floor continued to force parts of the crust northwards, raising up further mountain ranges. This overall convergence continues today, which is why the Aegean region is so mountainous.

Within the overall Mediterranean context of convergence and compression there are regions where crustal stretching was and is important, such as parts of the Aegean. During crustal stretching the surface of the earth cracks along faults. Parts of the crust descend to form tectonic valleys called grabens (as opposed to erosional valleys formed by rivers) which can also extend under the sea, the intervening blocks remaining as mountains, peninsulas, and islands (horsts).

Expansion was directly north–south in Asia Minor, giving major east–west grabens now occupied by rivers such as the Gediz and Büyük Menderes in Turkey. In the Peloponnese and southern Greece expansion produced northwest–southeast grabens, such as the Gulf of Corinth and the Euboean straits. In between these areas stretching was more complex, producing a series of isolated blocks, the Cyclades.

Mention should be made of an unusual event that occurred about six million years ago: the Mediterranean sea almost completely dried up. This happened when tectonic forces closed up the Straits of Gibraltar. Rivers flowing into the basin, principally from the Black Sea, were insufficient to maintain sea-level and the sea dried out, except for a few saline lakes resembling the modern Dead Sea. There may even have been a salty waterfall at Gibraltar, also feeding the lakes. Evaporation of water from the lakes produced deposits of gypsum (alabaster) and other minerals, seen today in Crete and elsewhere.

The climate of the last 1.6 million years has been marked by dramatic fluctuations. Within this period, loosely called the Ice Age, the climate has been generally cool, with warmer conditions typically lasting for about 10,000 years every 100,000 years. During the last glacial period, about 130,000 to 10,000 years ago, the climate of the Aegean was moist and cool. There were glaciers on the highest mountains of the Greek and Turkish mainlands and the island of Crete. Sea level was considerably lower than it is today, by about 120 m, and hence the river-beds were steeper resulting in more rapid erosion. Mountains were deeply incised, and broad, flat valleys were developed. The climate was coldest about 20,000 years ago. Warming began rapidly about 10,000 years ago, but by 8000 years ago the climate was more stable. Since then variation has been less extreme, especially during the last 4000 years.

Global climatic warming melted the glaciers and sea-level rose, stabilizing close to its present level about 6000 years ago. The sea invaded estuaries, drowning many Palaeolithic sites on the old, fertile river plains. The deep, protected bays that formed were useful harbours in antiquity, but many had a short life (e.g. Miletus and Ephesus). Sediments washed down by the rivers were deposited in the bays, commonly filling them almost completely (e.g. Thermopylae and the gulf of Malia). Agriculture increased erosion and hence aided this process. It should be noted that earthquakes can also produce local changes in sea-level that are superimposed on the global sea-level rise (e.g. Phalasarna and Western Crete).

Geological history is recorded by rocks – sedimentary, metamorphic, and igneous. Sedimentary rocks form on the surface by the accumulation of rock fragments (e.g. sand, mud), biological material

(e.g. shells, bones, plant material), or by crystallization of minerals from water (e.g. gypsum, salt). Most sedimentary rocks form under the sea or in lakes. Loose sediments are transformed into hard rocks when minerals crystallize from the water between the grains and cement them together. This process can continue after a rock is quarried, making the rock harder as it dries out. Cementation of sediments commonly occurs on beaches, making “beachrock”, which is common throughout the Aegean. Accumulation of the finest rock particles makes clay. There are many types of clay and not all are suitable for making pottery. However, good pottery clay is commonly formed in basins that also contain lignite, a low-grade coal (e.g. Corinth).

When rocks are piled on top of each other, for example during convergence, or in a sedimentary basin, those at the base are heated up and subjected to increased pressure. This is because the temperature increases with depth in the earth by an average of 30°C per kilometre. Many of the minerals that make up the rocks are not stable under these new conditions and will either recrystallize to form larger crystals or transform into new minerals, a process called metamorphism. The most common metamorphic rocks in Greece are marble, schists, and serpentinite, formed respectively from limestone, mud-rocks, and peridotite. Some areas of metamorphic rocks, such as the Cyclades, are considered to be the deeper equivalents of sedimentary rocks elsewhere. Others, like the Menderes massif south and east of Izmir, have a much more complicated history, with much older rocks and several cycles of metamorphism. Sometimes the rocks can become so hot that they melt to form plutonic rocks such as granites.

The geological structure of the oceanic crust is quite different from that of the continents – it is almost completely made of igneous rocks, that is those that were originally molten. Its base is dominated by plutonic rocks such as peridotite and gabbro that solidified deep in the earth, whereas the top is made of basaltic lavas that were erupted underwater. The lavas are in turn commonly covered by chert and limestone. Although there is no true oceanic crust in the Aegean region today, convergence of Africa and Europe has forced former parts of the oceanic crust up on to the land. The peridotites have been converted into the green or black rock serpentinite.

There are many volcanic rocks in Greece and western Turkey, mostly formed during the last 20 million years, and the activity continues today. These rocks formed when the sea-floor was thrust down deep into the earth. As the temperature rose, part of the rocks melted and the liquid made its way to the surface in volcanoes. Volcanic activity is now restricted to Santorini (ancient Thera) and Nisyros, but in antiquity Methana and Melos were active for short

intervals. There have been many different types of eruption. The largest was the “Minoan” eruption of Thera in 1650 or 1450 BC – almost 30 cubic km of volcanic ash was erupted. Since then activity has mostly been non-explosive, with the eruption of lava flows. On Nisyros volcanic activity has been marked by steam explosions with no lava or true volcanic ash.

Most metallic ore deposits, such as those of gold, silver, lead, iron, copper, and tin, are precipitated from hot watery fluids that circulate in the crust. These fluids start as surface water that descends into the crust. There it is heated, and metals, and other elements, dissolve in the water. They are precipitated as minerals when the water rises and cools. The heat necessary to drive circulation is sometimes associated with metamorphism, the emplacement of plutonic rocks such as granite or volcanism. Circulation of sea water into the oceanic crust also produces deposits of copper and other elements where these fluids vent on to the sea floor (e.g. the Troodos mountains of Cyprus).

The most common rocks in the Aegean region today are limestone and its metamorphic equivalent marble. These rocks are more resistant to erosion than other types of rocks and tend to form the hills, in the absence of tectonic movements. Paradoxically, both limestone and marble are soluble in rain water and prolonged erosion gives rise to a characteristic landscape called *karst*, after a region in Croatia. In these regions most drainage is not on the surface in valleys, but instead rain and snow-melt drain directly into swallow-holes (sink-holes). The drainage basins start as small conical depressions and can become quite large, with flat bottoms (there are many in Arcadia). Every swallow-hole is connected to a system of caves or fissures, that tend to be enlarged by continual solution of the rock. The springs can debouch many kilometres away, in some cases under lakes or the sea (e.g. the gulf of Argos). In many areas the fissure and caves system can store sufficient water for the springs to be perennial. Although *karst* caves are formed by solution of rock, precipitation of limestone from waters percolating into caves forms stalagmites and stalactites. This can only occur when there is little flow of water through the cave. A similar process deposits travertine around many *karst* springs. However, much travertine was quarried in antiquity.

Soils form by weathering of the underlying rock. Much of this weathering may have happened during the last glacial period when the climate was wetter, but glaciers were only on the peaks of the mountains. Limestone or marble gives a characteristic red soil called *terra rosa*. Although fertile, this soil is usually too thin on the hillsides for successful agriculture. In antiquity this soil was processed to give a red clay. The soft sediments that fill the grabens weather easily and tend to yield fertile soils. The best soils form on marls – sandy, clay-

rich limestones. Soils washed from the hills accumulate in the valleys to form alluvial soils. The abundance of water and the renewal of these soils by material washed from the hills during storms has made these areas very productive. Drainage in antiquity and recently has greatly increased the availability of these soils (e.g. Lake Copais).

Geometric Period c.900–c.700_{BC}

The Geometric period of ancient Greece is normally understood to last from c.900 to c.700_{BC}, taking its name from the "geometric" style of pottery decoration found throughout the Greek world at that time. This style is characterized primarily by the use of rectilinear motifs in various combinations; while it may also include the pictorial representation of both animals and humans, especially in the 8th century, these also follow the prevailing artistic conventions and appear obviously "geometric" in form.

The Geometric period can be said to have begun in Athens, where the characteristic style first emerged c.900_{BC}, evolving from its predecessor, the Protogeometric, which itself developed there around the middle of the 11th century_{BC}. The pottery decoration follows a definite stylistic evolution, so that the period can be divided into three phases, the Early, Middle, and Late Geometric (EG, MG, and LG

respectively), each of which may be further subdivided into two phases. The traditional dates for these phases are: EGI 900–875 BC; MGII 875–850 BC; MGI 850–800 BC; MGII 800–760 BC; LGI 760–735 BC; and LGII 735–700 BC. A word of caution is needed, however, when referring to these dates since, strictly speaking, they apply only to Athens. In fact, the whole chronological framework of the period has recently come under attack due to the rather tenuous nature of the evidence supporting it; a heavy reliance has been placed on the stylistic development of the pottery, taken in conjunction with historical accounts, since other methods that might be expected to yield more precise information, such as radiocarbon dating and dendro-chronology, have not proved particularly useful. Some confirmation for the dating scheme accorded to the pottery has been possible, for it has occasionally been found in association with Egyptian objects, particularly scarabs, which are datable to the reigns of individual pharaohs. Other information has been provided by relating the ceramic evidence to the traditional foundation dates of the Greek colonies in Italy as given by later writers such as Thucydides, but this is of limited value since it applies only to the last 50 years of the Geometric period; other historical events noted by ancient authors, such as the first Olympiad in 776 BC, have also been used, but in general there are very few fixed chronological points. Given this lack of corroborating evidence, some recent scholarship has suggested that all dates for the early Iron Age, including those for the Geometric period, should be lowered, but this view has itself met with much criticism and has failed to win general approval.

Dating for the various phases of the Geometric period also differs from place to place. The phases in Geometric decoration found in the Argolid and Corinthia match those at Athens very closely in development and date, but further afield the pace of the acceptance of change appears to have been somewhat slower and there is thus often a time lag in comparison to Athens. In Laconia and west Greece, for instance, the Protogeometric appears to have continued to the middle of the 8th century BC, while in east Greece the Early Geometric phase is very difficult to assess, and in Thessaly it is impossible to distinguish the end of the Late Geometric phase. Similar problems and uncertainties are also apparent in other areas, making it clear that the history of the Geometric style must take into account significant regional variation.

When the Bronze Age palace civilization came to an end at some point in the 12th century BC, all the components that had made that civilization what it was collapsed; the Greek world entered a new phase of its history, the Iron Age. The early part of the Iron Age (c.1200–900 BC, a period often also called the Dark Age) has

traditionally been viewed as a time of poverty, isolation, and depopulation, and even though this picture may be more representative of our own relative lack of knowledge about the period, there is also some truth in the traditional view that the Greeks had, in a sense, to rebuild their civilization. By about 900 BC, however, when the Geometric period begins, some degree of stability appears to have returned. The Geometric period was thus a time of great change, a time when the Greeks finally overcame many of the difficulties associated with the so-called Dark Age, and a time of rebirth characterized by the appropriately named Greek renaissance of the later part of the 8th century BC (LG).

A great deal of information about the period comes from the graves that have been found all over Greece. From the Kerameikeos and Areopagus areas in Athens, for example, comes a wealth of information about burial customs and about the pottery used in those burials. Generally cremation was employed, the bodies being burned on a pyre and then placed in a pot which was itself buried in a pit along with various possessions and gifts. The ash urns were different for men and women, and the goods contained in each also seem to have been gender-specific, weapons for instance in male burials, jewellery in female burials. Customs, however, varied at different times, and children were normally inhumed, often with their toys, while for a short time in the Late Geometric period, inhumation was also adopted for most adults. It is at this time that the very large Dipylon amphorae and kraters were used in Athens as grave markers. These pots, named after the area of the cemetery in which they were found, were all made in the same workshop and bear figured scenes representing the *prothesis* (lying in state) and *ekphora* (funerary procession). For many, these pots are the epitome of Greek Geometric art. Burial customs also differed in other areas of Greece, with some regions preferring inhumation, others cremation, while specific practices varied within these two categories. Interpretation of the burials and their contents has thus provided some understanding of social and economic organization among different individuals and groups at this time.

It was during the Late Geometric period, however, that the most significant changes occurred. This is the era of the Greek renaissance, so called because the substantial developments that took place at that time suggest a rebirth after the Dark Age. Some scholars take the very sharp rise in population that occurred in the 8th century BC as the catalyst provoking all the changes; consequent overpopulation, they argue, led to increased pressures on land and resources that in turn led to a growth in political centralization characterized by the emergence of the polis (or city state) ruled by aristocracies. Warfare among these

newly established Greek states was also a very common occurrence in this period.

Essential to this renaissance are the contacts with the outside world which, although never entirely lost in the previous centuries, are now seen on a much grander scale. These contacts themselves can partly be viewed as the result of some of the pressures facing the Greeks in the 8th century BC, pressures caused by such factors as overpopulation, a shortage of good land, a need for access to more natural resources, and political dissatisfaction. Partly to alleviate some of these troubles and to find solutions to them, a great colonizing movement began c.750 BC. The Greeks from some of the most developed (and hence often most troubled) states, such as Corinth, Megara, and Euboea, sent colonies to south Italy and Sicily. In the east, trading centres were established at places such as Al Mina on the Levantine coast, and trade was extended to other areas that included the Near East, Asia Minor, and Egypt. These eastern contacts in particular would profoundly affect Greece.

In the religious sphere, change is also very noticeable, especially in the sanctuaries. Although some of these existed earlier in the Geometric period, archaeological evidence indicates that there was a strong increase in the level of activity taking place at them by the 8th century BC; masses of votive offerings have been found, particularly pottery and, by the later part of that century, metal goods also appear. By that time temples to the gods were also being constructed, most of rather modest construction, but a few of massive size.

Contact with the east also brought about the adoption of the alphabet, knowledge of which was obtained through the Phoenicians and adapted somewhat by the Greeks to suit their own language. Literacy had finally returned after an absence of more than 400 years. This was a monumental achievement and among its earliest manifestations are the great Homeric epic poems, the *Iliad* and the *Odyssey*, soon followed by the works of the didactic poet Hesiod.

The adoption of the polis meant that, in this period, the Greeks never developed a real sense of nationality as we would think of it, yet they certainly possessed a great sense of national consciousness and pride, a Hellenism that partly manifested itself in the growth of the great Panhellenic sanctuaries, such as Olympia and Delphi. Indeed, their renewed contacts with the outside world helped to foster their identity – they were Greeks, the others were barbarians. The transformations of the 8th century BC led directly to the significant achievements of the archaic period that followed the Geometric.

Georgia

The land of Georgia occupies the southern slopes of the central section of the main Caucasus range. To the west it is bounded by the eastern coast of the Black Sea. To the east it stretches to Azerbaijan in the direction of the Caspian Sea. To the south it is bordered by Turkey and Armenia, with a historical claim to a substantial portion of northeast Turkey (the Tao-Klarjeti of the Georgian tradition).

The name Georgia has encouraged the idea that this land was so named by the Greeks on account of its agricultural resources (*georgia* means “farming” in Greek). (Georgians use an entirely different term, *sakartvelo*, and term themselves *kartvelebi*.) However, the apparently

Greek name is now taken to be a derivation from an Iranian root, *Gurj*. Greeks in antiquity did not use the term Georgia, but referred instead to western Georgia as Colchis (Byzantine Lazike) and to eastern Georgia as Iberia. The existence of these two Greek names reflects the principal geographical division within Georgia, caused by the so-called Surami ridge. As a result of this ridge, western Georgia looks across the Black Sea towards Europe and the Aegean, while eastern Georgia looks to Iran and Central Asia.

Greek knowledge of western Georgia is firmly attested by 700 BC in the poetry of Eumelus and Hesiod. The myth of the Argonauts, which was known to Homer, gave Colchis a particular significance in Greek culture from earliest times. However, according to archaeological evidence and later literary sources Colchis was not settled by Greeks until about 550 BC. From the 4th century BC Greek texts mention the towns of Dioscurias (modern Sukhumi), Guenos (near modern Ochamchira), and Phasis (near modern Poti) as Hellenic communities. In particular, Dioscurias and Phasis are said to have been founded by Greeks from Miletus, in the latter case led by one Themistagoras. The archaeological evidence also points to a significant Greek presence elsewhere on the coast of Colchis, at Eshera (north of Sukhumi), at Pitchvnari (near Kobuleti), at Tsikhisdziri, and perhaps in the environs of Batumi, which the Greeks of antiquity named Bathus Limen ("deep harbour"), whence its modern name.

Greek influence spread up the numerous rivers of Colchis into the hinterland, but not across the Surami ridge into Iberia. When Hellenic culture reached eastern Georgia it came with the Seleucids, who claimed Iberia as part of their imperial sphere. In Iberia Greek culture met not only local culture but also strong influences from further east. In later centuries Iberia was to be the diplomatic and military battlefield upon which the Byzantine Greeks fought the Persian empire, especially in the 4th to 7th centuries AD. Iberia's conversion to Christianity in about AD 337 helped the Greek cause, but Arab conquest in the mid-7th century was conclusive. Ironically, the loss of Iberia followed hard upon the famous Byzantine victory at the siege of Tiflis (modern Tbilisi), captured by the forces of the emperor Herakleios in 627. However, Iberians continued to exert influence at Byzantium: in the 10th century the Iviron monastery was established on Mount Athos by St Evthymios and his father.

By contrast, western Georgia had become an integral part of the Greek world, albeit at its periphery (e.g. Plato, *Phaedo* 109b). Colchis was known in classical Athens as a mercantile destination (Aristophanes, *Holkades*), providing a famous type of linen which rivalled that of Egypt, according to Herodotus (2. 104–05). When Xenophon's 10,000 reached the Black Sea at Trapezus (modern

Trebizond) in 400 BC, he saw the potential of Colchis and apparently contemplated settlement in the region of Phasis (*Anabasis* 5. 6. 36). In the Politic empire of Mithridates VI Eupator, from about 100 BC, Colchis was a principal reservoir of resources, providing quality timber and all else needed for shipbuilding. The Greek geographer Strabo mentions that a member of his family had been Mithridates' viceroy there (11. 2. 18).

Glass

Glass is a man-made material of great versatility. It is made by melting together three main ingredients: soda, lime, and silica. In antiquity silica came from sand that also contained the lime needed to make the glass water-resistant, and soda came either from natron, which occurs naturally in Egypt, or, in the east, from saline plants found in the deserts and marshy areas. If nothing was added to the basic mixture, glass was naturally bluish-green; coloured glass was made by adding specific metal oxides and varying the furnace conditions. Colourless glass, akin to modern crystal glass, used manganese or antimony as decolourizing agents. It seems likely that in antiquity glass itself was made from the raw materials in only a few places, and shipped around as ingots to different glassmaking centres.

The first glass objects known are from Mesopotamia and date from around 2500 BC. A technological breakthrough some 1000 years later led to the production of the first glass vessels. This was the invention of core-forming, whereby glass was formed around a rod covered by a core of dung and clay mixed with a little water. Decoration was added by trailing soft glass of different colours around the body and combing it into patterns with a pointed tool. After subsequent reheating the shoulders, neck, and rim were formed and any handles added. The

core-covered rod was finally removed after the vessels had been annealed (placed in a warm place apart from the actual furnace to cool slowly). The first vessels made by this method seem to have been produced in northern Mesopotamia around 1500 BC. The glass industry was born in Egypt not much later, but core-formed vessels were not produced in any great numbers before the time of Amenhotep III (1390–1352 BC). By 1450 BC Mesopotamian glassmakers were also forming vessels of mosaic glass, made by fusing together slices of monochrome glass or multicoloured canes that were then shaped around a core or, for open vessels, slumped over a form (positive mould). Early Mesopotamian and Egyptian glassmakers were also responsible for a great variety of objects, including pendants and beads of many different varieties. Diplomatic correspondence from the royal archives of el-Amarna, the new capital of Egypt established by Akhenaten (1352–1336 BC), mentions consignments of raw glass being sent from Tyre (modern Lebanon) and neighbouring cities. This speaks already for the importance of this region, credited by the Elder Pliny (1st century AD) with the invention of glass. The same area (the Levant) was responsible for a series of core-formed vessels.

Glass became known to the Greeks in the Late Bronze Age when documents in Mycenaean Greek call it *kyanos*. Imported Egyptian core-formed vessels have been recorded, principally from Cretan sites of the 14th and 13th centuries BC, while from mainland Greece, notably Mycenae and Kakovatos, come some Mesopotamian beads and pendants. The first items evidently made in Greece were a bowl with indented sides similar to metal and stone vessels, a tiny bull figurine, and a hilt for a distinctly Mycenaean type of sword, all of translucent blue glass perhaps of Mesopotamian origin (all three pieces are now in the National Archaeological Museum, Athens). Gaming pieces may also have been made locally. A series of ornaments is exclusive to Mycenaean Greece and evidently made there. Normally of translucent blue glass with flat backs and suspension holes, they occur in many different shapes, the most common being rosettes and spirals, the latter perhaps representing locks of hair. Most date from 1400 to 1200 BC. Moulds of stone, usually steatite, have been found on several sites, suggesting that there were a number of manufacturing centres. Ornaments of gold foil, quite often found with the glass examples, could also have been made in these moulds, the gold and glass sometimes fitting together. Some of the blue glass used by the Mycenaeans evidently came from Egypt, as illustrated by cobalt-blue glass ingots of evidently Egyptian origin that were discovered in the wreck of a merchant ship on its way to Greece that sank off the coast of southwest Turkey at Ulu Burun towards 1300 BC. Very similar ingots have been found at Tell Brak in northeast Syria (Mesopotamia).

In the earlier Iron Age the Greek contribution to the glass industry was a remarkable series of core-formed vessels, initially made principally on the island of Rhodes between about 550 and 400 BC. This Rhodian production was evidently inspired by Mesopotamian core-formed vessels found in 7th-century- BC contexts on the island. These may have been imported or possibly made by migrant Mesopotamian glass-workers. The Rhodian vessels were designed as containers for perfume or scented oils, which were Rhodian products of the time, and take their shapes from the contemporary Greek repertory of vases in pottery and metal. The most common body colour is translucent dark blue, but some are opaque white, brown, red, or olive green. Decoration usually consists of opaque orange, yellow, white, or turquoise trails combed into zigzag, festoon, or feather patterns. Traded far and wide, initially perhaps in the hands of Phoenician seafarers (residents of modern Lebanon), they reached every major site in the Mediterranean and also travelled as far as the Black Sea. Everywhere they are concentrated in areas of Greek commercial activity.

The Rhodian factories ceased production at the end of the 5th century BC and more than two generations passed before core-forming was revived in Mediterranean workshops. This occurred some time after 350 BC, coinciding with the conquest of the Persian empire by Alexander the Great. It marked the beginning of an era of Macedonian supremacy, and it seems likely that some factories were located in Macedonia and supplied northern Greece and Russia. Fewer vessels were now produced and many of the forms were more massive than before. New shapes included jars (*stamnoi*), three-handled flasks (*hydriskai*), and bottles (*unguentaria*).

By the 5th century BC the Greeks had two names for glass, one, *lithos chyti*, meaning “poured (or melted) stone”, an apt description of the core-formed vessels. The second, *hyalos*, signifies “transparency” or “clarity”. This could refer to 5th-century BC ornaments of clear yellowish and greenish glass in the shape of three-pointed stars and parts of palmettos and flowers, cast in clay moulds, and found in the workshop of Phidias at Olympia (now in the Olympia Museum). They were evidently drapery decorations, and different-coloured glass insets were used to enhance contemporary Greek architecture.

The second group of core-formed vessels has already brought the story into the Hellenistic period. During this time the glass industry generally flourished as never before, and the Greek world seems to have played a part in production. Excavations on the island of Rhodes revealed the presence of a glass factory operating in the late 3rd or early 2nd century BC making beads, and also vessels formed of two clear glass bowls fitted one inside the other with patterns in gold leaf

attached to the outside of the inner bowl, thus appearing “sandwiched”. The Rhodian finds are fragments, but more complete sandwich gold-glass bowls with known findspots come from Italy (four examples), Gordium (Asia Minor), and Olbia on the Black Sea. Rhodes may have been a centre of production of these magnificent vessels, but this is still debated. The Hellenistic period in glassmaking was marked by the production of fine vessels of mosaic glass, and finds from the Greek world show the familiarity of the people with such glasses, although it is still not certain where they were made. From graves at Palaikastro, near the town of Karditsa in Thessaly, come two very fine “bottles” of a particularly beautiful type of mosaic glass that imitates agate, a semi-precious stone, showing spiral patterns of white and purple in a brown ground. From another grave came a similar bottle of clear glass. These probably all date from the 2nd to the 1st century ^{BC}, and can be seen in the National Archaeological Museum, Athens. This was the time that a new type of tableware made by the slumping process was being produced in profusion at sites on the coast of Syria and Palestine. Bowls of various shapes were made, usually hemispherical or conical with pointed bottoms and decorated on the inside with grooved lines. Initially they were of clear greenish or brownish or colourless glass, and later sometimes of green, amber, blue, or wine-coloured glass as well. Known as “grooved bowls”, they were made with little variation for nearly 100 years between about 150 and 50 ^{BC}.

Around 80 ^{BC} a ship was wrecked near Anticythera off the southwest coast of Greece. Its cargo included colourless and mosaic glass vessels (National Archaeological Museum, Athens). Among the colourless vessels were two glass *skyphoi* (wing-handled cups), a bowl with bossed decoration, another of the fluted series, and one of similar shape with a finely executed engraved design. Bowls of mosaic glass, on applied ring bases, were hemispherical or had outward-curving sides, new shapes in the repertory. The mosaic pattern included spirals and a network pattern that had been introduced earlier, but new at this time was a true striped effect achieved by fusing together canes of different colours laid side by side (coloured band glass). Similar glasses to these have been found on the island of Delos (and now in the Delos Museum) in a context dating from 125 to 69 ^{BC}, together with deep “grooved bowls” of bright opaque colours, known in later contexts of the early to mid 1st century ^{AD} at Knossos in Crete (Herakleion Museum). Three small workshops making glass beads were also discovered on Delos.

Whether any of the glasses just described were actually made in Greece is perhaps unlikely, but probably of Greek or specifically Cretan manufacture were cosmetic boxes. These are made of thick

glass, green, yellowish-brown, or colourless with a greyish tinge, and most with known findspots come from Crete. In form they compare rather loosely with marble and pottery examples, and the glass is similar to that used for fingerings, some of which come from 3rd-century BC contexts. The glass cosmetic boxes are perhaps of the same date. The lid was made by the slumping process, while the box was evidently mould-pressed, using two shaped “forms” between which the molten glass was compressed, before being cooled and then cut, ground, and polished. Much of the tableware produced in Italy from the time of Augustus (see below) was made this way.

The discovery that glass could be blown revolutionized the industry. The first evidence for glass blowing comes from a collection of waste dumped in the Jewish quarter of the old city of Jerusalem around 50 BC (Israel Museum, Jerusalem), but blown-glass vessels did not become the norm for another 75 years. Thus in the late 1st century BC and earlier 1st century AD blown vessels are found alongside non-blown examples at Corinth (Corinth Museum) and in a grave group from Macedonia (National Archaeological Museum, Athens). The grave group includes five blown unguent flasks and a slumped shallow thin-walled bowl of a type made from about 25 BC to AD 25 in both brightly coloured and natural-coloured glass and recorded from all over the Mediterranean world. Many fragments of such bowls have been recorded from Knossos in Crete, but they were perhaps imported from Italy, where factories producing a fine series of tableware of monochrome brightly coloured glass and other vessels of intricate mosaic glass were certainly established in the time of Augustus (27 BC–AD 14). They seem to have supplied the Greek market, and to some extent to have reached Greek cities on the coast of Asia Minor as well. The same Italian factories were in part responsible for a series of bowls, often of mosaic glass, with evenly spaced ribs on the outside, known as “pillar-moulded bowls”. The type seems to have originated in Syro-Palestinian glasshouses around 25 BC alongside, and in part preceded by, a series with less evenly spaced ribs. Both series are known from the island of Crete, but are rare on the Greek mainland.

Early blown glass, principally small bottles for perfume or oil, is known from the Greek city of Priene on the west coast of Asia Minor and the Greek island of Siphnos, as well as the sites noted above, suggesting that in the age of Augustus the blowing technique was rapidly being adopted in many parts of the Roman empire. Vessels from both eastern and western glass-houses also reached the Greek world in the 1st century AD and, since certain types are common to both areas, it is not always easy to decide their origin. Mould-blown glasses, first made around AD 25, mostly came from Phoenician and Palestinian glasshouses. Typical Italian types such as a large jug with

embedded blobbed decoration from one of the Greek islands (British Museum, London), and small ribbed cups with coloured trails found in Crete, were also imported. Hemispherical cups, some with cut and abraded decoration, known from various sites in the Greek world, may also have come from Italy. An enamelled bowl from Greece (British Museum, London), which differs from the typical north Italian group in having a star rather than a rosette on the bottom, is perhaps from an eastern glasshouse that produced enamelled flasks known from sites on the Black Sea and on Cyprus.

By the end of the 1st century AD, when most glass vessels were blown and factories already established in the Syro-Palestinian area and in Italy increased their production, new glasshouses producing utilitarian glass vessels were established all over the Roman empire, no doubt including Greece, though actual evidence for Roman glassworking sites has yet to be revealed. Line glassware was still imported. From Italy may have come tall beakers with facet-cut decoration recorded from Crete in late 1st- and early 2nd-century-AD contexts, and Italy may also have been the source of mould-blown square (and cylindrical) bottles that were produced from around AD 70 until the late 2nd or 3rd century, as well as jars, which were later used as cinerary urns, between AD 50 and 200. Bottles of the late 2nd century AD from Thermopylae and Corinth have short necks, restricted at the junction with the body, and cracked off rims, and are decorated with fine polychrome trailing. They may have come from a Syro-Palestinian workshop responsible for a series with trailed decoration of flowers and birds. A polychrome bottle of similar shape, but with a taller neck, from Karditsa in Thessaly is decorated with embedded yellow and white trails, and perhaps came from Italy where bottles of this type, but with cut decoration showing Italian landscapes, date from the later 3rd and 4th century. To the same years belong “pipette-shaped” bottles of a type current in both East and West and found on the island of Crete.

Gods and Goddesses

Ancient Greek religion was not only polytheistic, but also multifaceted, in the sense that there was an evolution in the notion of divinity. Even within the frame of specific divinities certain features changed with time. The crystallization of our notion of the gods and goddesses derives mainly from archaic poetry, and particularly from the Homeric and Hesiodic epics. The ambiguities and contradictions that are observed in the mythic narratives explain the multifaceted character of the ancient gods and goddesses. The ruling divinities were the Olympians, so called from Mount Olympus, which was believed to be their residence. Before them were some primordial beings. In Hesiod’s *Theogony* the first beings were Gaia (“earth”), Chaos, Tartarus, and Eros. In the Hesiodic account the world was created essentially by Gaia, who gave birth to Uranus (“sky”), and then, mating with him, produced the 12 Titans, the Giants, and the Cyclops. Some myths are about the fear of losing power and the eventual succession among different generations of divine creatures. Uranus kept his children inside Gaia because he was afraid that they might take his power. Gaia, in order to be liberated from such a burden inside her, made a sickle, which their son Cronus bravely used to castrate his father. In the Hesiodic version the goddess Aphrodite was born out of Uranus’ castrated genitals, which fell on the sea’s foam. In Apollodorus’ version Cronus was persuaded by his mother to kill his father because Uranos had overthrown the Cyclops, the first children he had with Gaia. Cronus, in his turn, swallowed his children out of the same fear that his own father had. He was defeated by his son Zeus, who after the Titanomachy and the Gigantomachy acquired supremacy. Cronus and Rhea had six children, three sons and three daughters: Poseidon, Hades, Zeus, Hera, Hestia, and Demeter.

The notion of 12 gods and goddesses was established early in the consciousness of the Greeks, but the catalogue of them varies. The most common list of the 12 consists of the following: Zeus, Hera, Poseidon, Demeter, Apollo, Artemis, Athena, Hermes, Ares, Aphrodite, Hephaestus, and Hestia. There were local variations according to which Hades or Pluto takes the place of Hermes, or Dionysus takes the

place of Hestia. Besides the principal gods, there is also a group of minor deities such as the Graces, the Muses, Eros (not the Hesiodic primordial creature, but rather the son of Aphrodite), Hebe, Eileithyia, Hecate, Pan, the Nymphs, the Horae, Themis, the Moirae, Nemesis, the Erinyes, and others with different degrees of importance. It is uncertain how many were regarded as deities and with what specific role, and how they were worshipped. A general feature that is often pointed out regarding ancient Greek religion is anthropomorphism. Although they were believed to have power over nature and humans, the deities were subject to mortal needs such as food, drink, and sex. Political behaviour was not unknown among them and the Homeric epics present the gods as taking sides and making enemies even among their fellow gods. There is no representative of absolute perfection or absolute evil, but they were immortal, even though subject to mortal feelings as well.

Zeus was thought to be the father of gods and men. The expression "Zeus father" (Zeus *pater*) is equivalent to the Latin Jupiter. Besides the myths of succession that are associated with him, there are other myths related to his birth, the most common being the Cretan one. According to this myth the child was hidden in a cave on mount Ida so as not to be swallowed by his father, Cronus, and was nourished by the goat Amaltheia, while the Couretes danced around him and with their noise drowned his cries. Zeus was the god of weather and the one who makes thunder and lightning. Many of Zeus' Homeric epithets are related to his control of natural phenomena. He was notorious for his erotic liaisons that made him the father of many gods and heroes. By Hera he had Ares, Hebe, and in some versions Hephaestus and Eileithyia. By Leto, a Titaness, he had Apollo and Artemis. By Maia he had Hermes and by Semele, a mortal, Dionysus. In Homer he is also the father of Aphrodite by Dione. He gave birth to Athena, on his own, by swallowing her mother Metis. He was the father of Persephone by Demeter, of the Moirae, the Horae, the Graces, and the Muses. The most famous heroes claimed their descent from him: Heracles was his son by Alcmene, Perseus by Danae, the beautiful Helen by his daughter Leda. His many epithets are revealing of different emphases on various aspects of his divine identity in the mind of his worshippers. He is Zeus Herkeios, family protector, and also the protector of the domestic hearth (Ephesteios). As the god who soothes, especially at the end of the winter, he is worshipped as Meilichios. Freedmen used to worship Zeus Eleutherios in a sanctuary in Athens. As the ultimate lawgiver and bearer of justice he is Zeus Themistios.

Hera, daughter of Cronus and Rhea, was the sister and wife of Zeus. She is the feminine representation of natural forces, and the goddess

of marriage and protector of women. In literature she is often depicted as the jealous wife who is constantly after her husband's lovers and offspring by them. In the Homeric *Hymn to Apollo* she delays the birth of Apollo and Artemis. Her persecution of Heracles is a beloved theme in literature and art. She is often referred to as Argeia, since Argos is one of the most ancient places of her worship, or as Zygia due to her patronage of marriage.

Demeter is another goddess closely connected with femininity, and particularly maternal powers. The evident etymology of her name ("earth-mother") has led to research into her relationship with the period of matriarchy in Greece. The main myth in which she features as a central figure is that of the quest for her daughter Persephone, who had been abducted by Hades. She finally finds her and makes the arrangement that Persephone will stay for some months with her husband in the Underworld, the mourning period for Demeter and winter for mankind, and for some time with her mother on earth. Demeter was worshipped extensively at Eleusis, in the Eleusinian Mysteries in autumn time. The Thesmophoria was a widely celebrated female festival.

Poseidon is most commonly known as the god of the sea. Some of his Homeric epithets refer to him as the "earth-shaker". He was married to Amphitrite, but like his brother Zeus fathered many heroes. Some of his sons have monstrous features, like the Cyclops Polyphemus. He competed with the goddess Athena for the patronage of the city of Athens and lost. Athena, mostly known as the goddess of wisdom and prudence, is a multifaceted figure. She is the personification of feminine virginity combined with a warrior's virility. She was born from Zeus' head after he had swallowed her mother Metis; she therefore incarnates the *metis* (cunning intelligence) of her mother. Athena is an active participant in many myths due to her role as the protector-goddess of many heroes, such as Odysseus, Heracles, Perseus, and others. In Homer she fervently protects the Achaean side in the Trojan War, and accompanies her favourite Odysseus in the *Odyssey*. One of the most glorious ancient festivals, the Panathenaia in Athens, was dedicated to her. In Hesiod she is the one who teaches the art of weaving to Pandora, the first woman. One of her standard epithets is that of *ergane* ("worker"), revealing her relation with many women's works. An intriguing deity, she represents the ferocity of war and is easily recognizable in art by her attributes, a shield, spear, and helmet. She is also the guardian of peaceful community life.

Apollo and Artemis were twins, the children of Zeus and Leto. The first part of the Homeric *Hymn to Apollo* tells the adventure of their birth. Their mother was being pursued by Hera, and Delos was the

only place that agreed to receive her; it therefore holds a central position for their cult. The second part of the Homeric *Hymn to Apollo* tells how Apollo came to be associated with Delphi, after killing a huge female serpent, Python. He was the god of divination and Delphi became the most famous oracle in antiquity. His epithet *Loxias* designates the oblique answers that he gave. He was also the god of medicine, healing, and music. In *Iliad* 1 he is the one who brings the plague. Apollo was also associated with the sun, hence the epithet *Helios*. He was the leader of the Muses, *Mousagetes*, and the patron of lyric poetry, particularly choric. Since he was the god so directly associated with mankind (through his link with medicine, music, and divination) he held a significant position in cult and was worshipped in many places, particularly Delos, his birthplace, where the *Delia* festival was celebrated every five years, and in Delphi, where there were many festivals, such as the *Pythia* and the *Theoxenia*. Artemis, Apollo's twin sister, was the goddess of hunting and represents untamed virginity. Unlike Athena, the other virgin goddess, she was not a city person, but rather dwelt in wild country, and was known as the lady of the wild beasts (*Potnia theron*). She was worshipped in many places, particularly in Sparta as Artemis Orthia. She was associated with many women's festivals, because she was worshipped with *Eileithyia*, the goddess who brought relief to pregnant women by granting them fast delivery.

There are two versions of Aphrodite's birth, the goddess of beauty and love. According to Hesiod (*Theogony*, 190–200) she belongs to the most ancient divine generation, before the Olympians ever existed, born from Uranus' castrated genitals that were combined with the sea's foam. In Homer her mother is Dione who mated with Zeus. Her epithets *Kypria* or *Kythereia* show her connection with the islands of Cyprus and Cythera, both claiming to be her birthplace. The same conflict arises regarding Eros, who in some versions is one of the primordial divinities, like Gaia, yet in most literary accounts and artistic depictions he is the son of Aphrodite and Ares, incarnating a warlike feature of passionate erotic desire. In Plato's *Symposium* Pausanias makes a distinction between Aphrodite Ourania ("heavenly"), and Aphrodite Pandemos ("of the people", "possessing a vulgar nature"). This difference has shaped the cult of Aphrodite and the reception of the goddess in religious terms.

Ares was the warlike god. Unlike Athena, he represents the passionate and irrational desire and insatiable thirst for war. The spear and the burning torch are his symbols. In Homer he is the lover of Aphrodite. He was worshipped everywhere, particularly in Sparta, Arcadia, and Elis. Hephaestus, associated with fire and artwork, is in Hesiod's version the son of Hera alone, and therefore, as a product of

the female only, he is lame. He was the renowned maker of many wonderful objects of which extensive description (*ekphrasis*) is given in literature, such as the shield of Achilles in *Iliad* 18. In some accounts he is married to Aphrodite. He is associated with volcanoes, and was therefore worshipped in Sicily, especially near Mount Aetna, and the Lipari islands where he worked with the Cyclops. There was an annual festival in his honour in Lemnos, and in Athens the festival of Chalkeia in October. There was also a feast with the name Hephaestia.

Hermes and Dionysus were both offspring of Zeus, both involved in stories about coming to power. Dionysus' place of birth was Thebes. He was the son of Zeus and Semele, a mortal princess, the daughter of Cadmus. Semele, having fallen into Hera's trap, asked to see Zeus in all his glory, and was destroyed by lightning. Zeus took the baby Dionysus, who was born some months later from his father's thigh. The general consensus ascribes to Dionysus a Thracian or Phrygian origin. His cult was widespread in northern Greece and had an orgiastic character, adhered to particularly by women in a form that demanded religious ecstasy (*ekstasis*). Women were swept away by his divine nature and abandoned their life to join frenzied dances in the mountains, swinging thyrsi and torches. There are various artistic representations of maenads, as well as literary ones, the most famous being Euripides' *Bacchae*. Dionysus was popular as the god of wine and merriment, although wine does not seem to have had any significant role in the ancient orgiastic cults. The use of a mask was characteristic of his cult. The birth of drama is associated with the cult of Dionysus. The greatest theatrical festivals, the greater and the lesser Dionysia, were in honour of him. He was also associated with powers of fertility in nature, thus his most ancient representations consist of wooden images with the phallus as a symbol of fertility. The name Dionysus appears in linear B tablets, which suggests that he was not unknown to the Mycenaean civilization. Hermes is another "young" god in myth, although probably quite old in origin. He was born on the Arcadian mountain of Cyllene and proved his characteristics of inventiveness, trickery, and versatility already from babyhood. The stories of the deception of Apollo by the baby Hermes who stole his cattle and of Hermes' invention of the lyre are found in the Homeric *Hymn to Hermes*. He is associated with the notion of transgressing limits. He is the one who accompanies mortals to Hades, known for that as *psycho-pompos* ("escorter of souls"). He is also the messenger. Together with Athena he protects heroes in perilous enterprises and is often depicted in art escorting heroes. His characteristic attributes in art are the winged cap and the herald's wand. Much associated with Hermes is Hestia, the representative of home and family life; her name

means “hearth”. She was closely connected with Zeus, her brother. She took an oath of eternal virginity. She is the least anthropomorphic god of all and is never mentioned by Homer.

It is a commonplace to talk about the fusion between ancient and Christian religion. In some places, such as the southern Mani and remote islands such as Lesbos, popular attachment to ancient religion was so strong that total Christianization did not come before the 9th century AD. The struggle between paganism and Christianity was a common topic for writers on both sides. There is intense scholarly debate as to the relation between Hellenism and Christianity and the mutual influence of the one on the other. Despite many attempts by the Church to eradicate the practice of ancient religion it is still alive today in some folk customs and ideologies. The ancient gods and their spheres of influence have been fused with the cult of the saints: St Nicholas is the protector of seamen; a certain St Demeter was worshipped until recently in the region of Eleusis. Some saints have a specific role as healers or guardians against evil. As Martin Nilsson remarks: “Christianity easily swept away the great gods, but the minor daemons of popular belief offered a stubborn resistance.” The belief in Hades, although no longer as the brother of Zeus and Poseidon, has many of the archaic elements that may be seen in Homer. Historians of religion and other scholars interested in great battles, particularly in the period of late antiquity and Byzantium, often take sides according to their personal beliefs and fail to see the periods in question with a sympathetic eye. As is often the case with languages, the mythology of ancient gods has not totally disappeared, but has left its remains in modern beliefs.

Gold

Although one of the major metals of antiquity, gold was not the first metal to be exploited, even for decorative purposes. This is probably because its extreme malleability made it unsuitable for making tools. The earliest regular use of gold dates from the 5th millennium BC (Neolithic) in Bulgaria, where containers of sheet and cast gold were found, with gold-dust decorated pottery vessels. Two different types of gold deposit were worked in antiquity – those in solid rock (primary deposits) and those in the sediments of rivers (placers). However, in both gold occurs as the native metal and smelting thus largely consisted of melting the separated metal.

Primary gold deposits are of many different types but one of the commonest is the vein deposit. Here the gold occurs as minute metallic grains in veins of white quartz typically up to a few metres wide, commonly with pyrite (iron sulphide or “fool’s gold”) and other sulphides. Such deposits form from hot circulating watery fluids. The fluids are very dilute and are usually associated with granitic intrusions or metamorphism. Gold deposits of this type were exploited in antiquity, but required much labour because the hard rock had to be crushed before the gold could be extracted.

Placer gold occurs as dust, grains, and nuggets in sands and gravels deposited by rivers. Such deposits form by the weathering and breakdown of the hard rock in which the gold originally crystallized, lighter minerals originally present in the rock are slowly swept away by the flow of the water in the river, and the heavier minerals, including the grains of gold, are left behind. A placer miner will search for gold in parts of the river protected from the full force of the river current, such as downstream of large boulders or on the inside of bends in the river bed. The gold can be separated from the sand and gravel of the river bed by a number of different methods, such as pans and sluices, all of which mimic the sorting action of the river. Herodotus described gold extraction in the Phasis river (modern Rioni) of Georgia thus: “The mountain torrents are said to bring down gold and these barbarians catch it in troughs perforated with holes and on fleecy skins.” This technique no doubt gave rise to the legend of the Golden Fleece. When a river changes course, its placer deposit will become “fossilized”, but can still be exploited in the same way.

Although placer gold deposits are mostly produced by mechanical processes of alteration and sorting, there is also a chemical part to the process. Early writers on mineralogy were aware of this and spoke of gold nuggets “growing” in rivers. When a rock is weathered, most of the gold remains in the solid, metallic form, but some goes into solution in the water. In the river bed the chemical conditions are different and the gold in the water is plated out on to gold grains ahead) present. This is why gold grains in placer deposits can be much

larger than grains in rocks.

Gold has been mined in Macedonia and Thrace since the Bronze Age, but serious exploitation did not begin until Philip II gained control of the mines in 358 BC. Almost all the rivers in this area had some placer deposits, but most were exhausted in antiquity. About 300 tonnes of gold were extracted in Macedonia and Thrace between 1200 BC and AD 50. In recent times the Axios and Gallikos rivers north of Thessalonica have yielded the most gold. This placer gold originated in the meta-morphic rocks of the region. Some of these primary deposits were also directly exploited by the Thracians on Mount Pangaeum, where the gold occurs in quartz veins with pyrite.

There were several gold mines on the island of Thasos, and those near Kinyra, visited by Herodotus in the 5th century BC, were considered to be the most important. Much of the gold here, and on Siphnos, occurs in primary deposits of quartz veins with pyrite and copper sulphides. However, recently it has been found that the highest concentrations of gold on Thasos occur in sediments filling cavities in the marble host-rock. These cavities form by solution of the carbonate minerals in percolating rainwater, exactly as caves form in limestones. Streams that ran through these passages washed in the gold-bearing sediments to make these underground placer gold deposits.

The most famous ancient gold deposits of the Aegean region were those of Lydia. Exploitation of these very rich placer deposits of the Pactolus river started around 700 BC, but were exhausted by Strabo's time. The gold originated in quartz-gold veins in the metamorphic rocks to the south. Weathering liberated the gold, which was then transported by rivers and laid down in sandstones and conglomerates in the Gediz valley, some of which underlie the acropolis of Sardis. At a later time these rocks were again weathered and the gold redeposited in the beds of the present rivers. It is this two-stage process that gave the unusually high concentrations of gold here.

Much ancient gold used in the Aegean region was probably imported from Egypt. There it was first extracted from placer deposits of the Nile valley. Later, quartz-gold veins in the Eastern Desert were exploited, first from opencast and then from underground mines. Gold was also obtained from Nubia to the south (*Nub* means "gold" in Ancient Egyptian).

Although gold commonly occurs as the native metal, it is not usually pure, but alloyed with silver and copper. The silver alloy was called electrum on account of its colour, which was said to resemble that of amber. On occasion silver was deliberately added to extend the more valuable gold. This process was called *diplosis* ("doubling") by the early Egyptian goldsmiths. The gold content of such alloys was determined by the use of touchstones. These are small smoothed

pieces of fine-grained, dark rock, hard enough to abrade gold. The gold was rubbed on the rock and the colour of the streak was used to determine the purity. The best touchstones were said to come from near Sardis, hence the synonym “Lydian stone”. Many different types of rock were used, such as chert, siltstone, hornfels, and tuff.

Another impurity in much ancient gold is represented by minute grains of white metal of the platinum group of elements. These metal grains occur in serpentinites and are concentrated in placer deposits. The common presence of these grains attests to the importance of placer, as opposed to primary gold. Such grains could be a nuisance to goldworkers but were rarely removed.

The earliest attempts at refining were probably concerned with the removal of copper from gold. This can be done by heating the molten metal in a stream of air. During this process of cupellation the copper would be oxidized to form a slag. Separation of silver from gold was more complex. It was first developed at Sardis during the late 7th century BC. Electrum was mixed with salt and brick dust in a pot. The pot was heated for a long time without melting the metal, so that all the silver would be converted into chlorides and absorbed into the brick dust.

Gortyn

City in Crete

The site of Gortyn lies 16 km inland from the south coast of Crete. Originally a Minoan settlement, it was refounded by Greek immigrants from Achaea, Thessaly, and Arcadia (central Peloponnese), followed by Dorians. From the 4th century BC Gortyn seems to have been involved in perpetual feuding with Knossos, each city striving for superiority over the other. When the Cretan cities became involved in war with Rome, Gortyn sided with the Romans in 66–65 BC and was rewarded by the victorious Quintus Caecilius Metellus with the title of

maxima civitas and the position of provincial capital of the Roman province comprising Crete and Cyrene.

The early history of Gortyn is associated with the Gortyn law code of c.450 BC, found built into a wall of the odeum which was restored c.AD 100, though the inscription bearing the code may always have been visible. The code deals with a range of private legal matters, including family property, adoption procedures, slaves, mortgages, sureties, and donations. It reveals that slaves had certain rights, including that of permission to marry free women. Rape was a civil offence punishable by a fine, the amount depending on the status of the victim. A magistrate could use his discretion to decide whether a rape had been committed. This most important source of social and legal conditions in the Archaic–Classical period indicates the existence of a highly stratified society in which disputes over property rights and successions played a major part.

In the Roman period Gortyn continued to be the most important city in Crete. Christianity was preached early in the island. In the Pastoral Epistles Paul is represented as sending Titus to Crete “to set in order things that are wanting” and to ordain elders in every city (Titus 1: 5). Gortyn may have been one of these, for by c.170 AD we learn from Eusebius of Caesarea (*Eccles. Hist.* 4. 21 and 23) that Philip was bishop of Gortyn. He received a letter from Bishop Dionysius of Corinth praising him for his “many noble acts” and putting him on his guard against heresies. Gortyn had already won a good reputation which Philip was upholding against heresies, suggesting a relatively long-established Christian community there. Gortyn was the metropolitan see of Crete and the remains of seven churches have been found, including one dedicated to Hagios Titos, the presumed founder of the bishopric.

Exploration of the ruins of Gortyn up to World War I revealed the remains of a praetorium, baths, an amphitheatre, and circus as well as the Christian churches. The city, which covered an area of 150 hectares, was abandoned during the 7th century under increasing pressure from Arab raiders.

Government, Theories of

The Classical approach to politics and government was concerned both with the institutional features of political regimes and with the question of the relationship between philosophy and government. The polis, the city state which presented the context for the development of that approach, was in many respects unique. From the perspective of the theory of government, the institutions of the polis can be illustrated by taking Athens as a model, since it was mainly Athens that provided the environment and the inspiration for political philosophy. The model, which was characteristic of Athens during the period of the city's greatest power, was based on the constitutional reforms of Cleisthenes (507 BC). Male citizens formed the Assembly (*Ekklesia*), the forum of direct democracy, which met regularly. The elected bodies were the Council of Five Hundred and the courts. But election to these bodies reflected a notion of representation very different from that which developed after the Middle Ages in Europe. The system of filling offices was a combination of election and lot: the townships (*demoi*) of Athens elected candidates and the holders of office were then chosen by lot from those elected. For the Athenians this system was democratic because it equalized the citizens' chances to hold office. The idea of citizenship was deeply participatory and left an unmistakable mark on Greek theories of government.

Political philosophy and the theory of government developed after the end of the Peloponnesian War and the defeat of Athens. The idealized account of the Athenian regime presented by Thucydides (in the Periclean Funeral Oration) emphasized both the civic commitment by the citizen and the confident and relaxed quality of life in Athens. The focus throughout was on the balance accomplished by Athenian political life between participation and freedom, public-mindedness and self-development. The civic greatness of the Periclean age was exemplified in a civilized way of life, in culture, and, characteristically, in the art of the 5th century BC. By contrast, the academic specialization of Athens came with the years of decline. Plato's Academy (385 BC) and, some 50 years later, Aristotle's Lyceum were founded in the aftermath of the humiliation of the model city state.

In the *Republic* Plato sought to define justice and asked whether justice can be found or created in the world of the polis. Plato's sublime exposition of his philosophical ideal in the *Republic* should be considered in conjunction with his account of "a half-way house between the actual and the ideal" (Barker, 1918, p. 183) in the *Laws*, written almost 30 years after the *Republic*. In the *Laws* an Athenian discusses with a Spartan and a Cretan the possible constitutional arrangements of government in a projected colony. Although there are

also Spartan influences in Plato's thought, the Athenian model remains central in both positive and negative ways.

But the most important classical influence upon later theory comes from Aristotle, who was a member of Plato's Academy until Plato's death in 347 BC. Aristotle took over Plato's interest in political philosophy but approached its themes from a markedly different perspective. Aristotle's theory of political regimes in *Politics* proposes a classificatory model with three main types of organization of government: monarchy, aristocracy, and constitutional government. There are also three deviations: tyranny, oligarchy, democracy. Actual regimes vary, depending on the distribution of power according to rank and wealth. In addition to the analytical discussion in *Politics*, Aristotle undertook the empirical investigation of the operation of government in contemporary city states. These empirical studies, unarguably the first texts in the history of comparative political science, are lost, with the exception of the *Athenian Constitution*. Of equal significance has been the moral and political philosophy outlined in *Nicomachean Ethics*, a work of immense theoretical and methodological influence. For Plato the quest for truth was an ascent from mere opinions to the light of reality. There was an unbridgeable gap between the two. By contrast, Aristotle (and political science in the Western tradition since then) takes as a starting point common opinions in the polis, aiming to explicate and eliminate the inner difficulties which arise from an analytical consideration of these opinions. Regarding political methodology, Aristotle made two main contributions. First, he established political science as a comprehensive social science on the assumption that its comprehensive character corresponds to the comprehensive character of the political community. Other communities (social, religious, and so on) are parts of the political community which regulates them for the common good. Second, starting from the assumption that the choice of method (and degree of exactness) will depend on the subject matter, Aristotle put forward a distinct method of political inquiry, arguing that the objects of political science rest on human convention not nature.

The centrality of Plato and Aristotle for the future development of the theory of government cannot be readily gauged from an examination of the schools of political thought that immediately followed the two great thinkers. The schools of the Epicureans and the Cynics, which began some 30 years after Aristotle, followed new lines of thought which centred respectively on the pursuit of happiness through avoidance of pain and anxiety and on protest against social convention. These lines (which, despite their differences, converged in their withdrawal from the sphere of political activity) were to become

influential at a later stage, more so in western Europe than in Greece. In the latter the theory of government evolved in interaction with the kingdoms of the Hellenistic world beyond the Greek peninsula. The most important school of thought in the century that followed Aristotle's death, the Stoics, tolerated and occasionally defended the new monarchies, which were aiming at the integration of Greeks and people living in Asia. The theory of the deified king as a symbol of unity became influential throughout the Hellenistic world and was later partly adopted by the Romans. By the end of the 2nd century BC, however, Stoicism was revised by Panaetius of Rhodes. The revision was meant to recultivate Stoicism's moral philosophical content and in the process began to look back to ideas drawn from Plato and Aristotle. Panaetius worked on a humanitarian and universalist version of Stoicism, according to which justice is the bond that keeps polities together. In so far as a polity becomes unjust, it loses that basis of harmony which makes it a polity. This approach had great influence on Cicero and Roman legal theory, but it also signified a degree of adaptation of Platonic and Aristotelian concerns in the new context of a Mediterranean world which was becoming increasingly integrated economically and culturally (Sabine and Thorson, 1973, pp.151–52).

Grammar

The term "grammar" comes from the Classical Greek *grammatike technē* (later abbreviated to *grammatike*), which simply means "skill of writing" (Greek *gramma*, "alphabetic character", "writing").

Accordingly, the *grammatikos* was someone who knew the alphabetic characters, who was able to read. In Hellenistic times *grammatike* progressively took on the meaning of “linguistic and literary studies”, i.e. the present sense of “philology”. This was a result of the influence and development of various intellectual movements. Consequently the term *grammatikos* stood for a professional philologist, someone who was concerned with textual criticism and the interpretation of Classical works. In Late Antiquity a semantic narrowing occurred: grammar was now simply understood as phonology and morphology, which still form the central field of grammar. The Romans adopted the terminology together with the contents. The loan translation *litteratura*, however, was not applied in this field, whereas the Greek loan word (*ars*) *grammatica* passed as a technical term into most European languages.

In antiquity the systematic scholarly exploration of language and the development of proper grammatical terms were the work of philosophers. Although they were simply considering their own language and not doing any comparative linguistics in a modern sense, the Greeks nevertheless managed to create a terminology that is still in use by observing and compiling linguistic facts and arranging them into different fields. The first philosophical discussions about language date from the time of the Sophists (5th century BC) with a focus on the relation between word and object. Rather casually, philosophers also touched on grammatical topics: they distinguished for instance three genders of the noun. Plato’s *Cratylus*, in which he deals thoroughly with linguistic problems, offers the basics of phonology. Alphabetic characters are distinguished according to vowels and consonants, and words are analysed in syllables. Syntax is also addressed in addition to morphology; for the first time the denotations *onoma* (“noun”), and *rhema* (“verb”), are explicitly introduced as parts of speech. The terminology was taken up and partly refined by Aristotle. He explained that conjunctions and particles are also parts of speech, as are articles and demonstrative pronouns. In his writings we find the technical term *ptosis*, (“case”, “inflection”), for the first time as a designation for all morphological variations of word forms, i.e. not only nouns but also verbs. His terminology was extended and concretized by the philosophical school of the Stoa (from about 300 BC), who established grammar as a scholarly field of its own. As to phonology, the Stoics defined a set of 24 alphabetic characters as “elements of words” and they distinguished seven vowels and six consonants. As to morphology, they examined the inflection of nouns and verbs. Moreover, the tenses and gender of verbs were systematically described. In the field of syntax they explained constructions of active and passive voice, and

also the role of the nominative and oblique cases. Etymology was particularly studied, as it had been by Plato. Although they pursued it with true passion, the results were obviously rather naive from the perspective of modern linguistic knowledge. The numerous irregularities in word formation and use were interpreted by Stoic philosophers as following from a principle of anomaly prevailing in language. Their method was purely descriptive: they merely stated facts but refrained from finding reasons for inconsistencies.

Grammarians of the Hellenistic period, by contrast, above all the Alexandrians (c.2nd century BC) who were leaders in philology at that time, tried to put regularities of language in the foreground, considering irregularities as deviations from normality. Their basic principle of explanation, which they called analogy, has predominated ever since. This method had another starting point: whereas the Stoics proceeded from logical assumptions, Alexandrian philologists dealt with grammar for practical, i.e. didactic, reasons. As Greek civilization spread in the Hellenistic period, they tried to provide tools for non-Greeks to learn Greek language and literature. Morphology especially was understood as a system of analogies. Groups of identically inflecting words could be distinctly classified by corresponding rules so that patterns of declension and conjugation were set up and, at the same time, irregularities were registered. This method was also purely descriptive. The first systematic description of phonology and morphology was compiled by Dionysius Thrax (c.100 BC) under the title *technē grammatikē* ("science of grammar": syntax, defined as the composition of words in a sentence, is mentioned but not treated in detail). This work was the first grammatical manual for didactic purposes and consequently achieved wide circulation. From about the 4th century AD it was regarded as a standard grammar for Greek, forming a basis for further research throughout the Byzantine period and up to the Renaissance. Dionysius defines grammar as the "knowledge of what is normally said by poets and prose writers". His work is divided into six parts: reading aloud, explaining literary expressions, commenting on words and knowledge, etymologies, finding regularities, and finally literary criticism. From his explanations it becomes obvious that the eight parts of speech (noun, verb, participle, article, pronoun, preposition, adverb, conjunction) are determined by the sentence as a whole and, consequently, considered as (relative) parts of the sentence. The order of enumeration is intentional: the most important parts of speech, noun and verb, are named first. This is in accordance with linguistic and philosophical reflections from the past, where these two elements were already regarded as determining a sentence. Moreover, the first five word classes are inflectional, the last three are not. Dionysius'

classifications and terminology were adopted by Roman grammarians. They adapted the system to the Latin language, also translating technical terms into Latin. These still survive (for instance *ptosis* = *casus* = “case”). Apollonius Dyscolus (2nd century AD), basing himself on the Stoics and on Dionysius Thrax, dealt extensively with syntax in a way that was quite subtle for his time. He defined syntax as a combination of words considering the coherence of the whole sentence. He illustrates the central position of noun and verb in a sentence by remarking that a sentence will become senseless or at least indefinite if these two elements are omitted. He also wrote special studies on pronouns, adverbs, and conjunctions. Furthermore, he introduced the terms transitivity and intransitivity (in relation to verbs). With this grammarian, the separation between grammar and philology was fulfilled, so that the development of an independent discipline could begin.

H

Hades

Hades, which in antiquity could denote both the subterranean kingdom of the dead and the god who ruled over it, means “that which is unseen”, according to an ancient etymology. In the Classical period, however, “Hades” invariably referred to the god, never to his realm, which is described as “the house of Hades”. He was the brother of Zeus, who ruled the upper air, and of Poseidon, who ruled the sea, though he never visited Mount Olympus. Rarely is mention made of any cult in his honour, due no doubt to the fact that he is characteristically described as “implacable” (*adamastos*) and “relentless” (*ameilichos*), and “most hated of all the gods”. The most celebrated myth associated with his name involves his abduction of Demeter’s daughter Persephone, whom he deceived into becoming his bride. In Greek mythology this is the explanation for the changing seasons, since Demeter, who succeeded in gaining her daughter’s release from the clutches of Hades for eight months of every year (spring and summer), grieves and neglects the earth for the remaining four (autumn and winter).

Little is known about the appearance of the mythological kingdom of the dead. Its essential characteristic, however, was its impenetrable darkness. The earliest literary description is to be found in book 2 of Homer’s *Odyssey*, where Odysseus visits the bounds of Oceanus in order to consult the denizens of the underworld. In book 24 the messenger god Hermes conducts the gibbering dead past Oceanus, the white rock, the gates of the sun god Helios, and the realm of dreams until they eventually reach the asphodel meadow.

The next literary description of Hades is provided by Aristophanes in his comic masterpiece *Frogs*. Having asked Heracles to describe to him the route by which he descended to the underworld to fetch Cerberus, the god Dionysus is informed that he will first come to a fathomless lake which he must cross in Charon’s boat and then to “serpents and beasts in thousands”, a “mass of mire”, and “everlasting dung”. Another important literary source is provided by myths put forward by Plato in his dialogues *Gorgias*, *Phaedo*, and *Republic*. The so-called Orphic gold leaves, which date to the 4th century BC, also provide limited information about the imaginary topography of the region. In addition, underworld scenes frequently appear in a series of Apulian amphorae of the later 4th century BC.

Hades’ helpers only gradually assumed an identity and always

remained somewhat shadowy. The earliest to emerge was Cerberus, the many-headed dog who acted as warder of the dead. Charon, the ferryman of the dead, did not appear until much later. In the Hellenistic period it became customary to place a small coin known as an obol in the mouth of the dead to pay for their fare across the River Styx. Charon is frequently depicted on Attic *lekythoi* (unguent flasks), waiting while the dead approach his boat.

It was a significant feature of Greek belief that the good and the bad led an equally cheerless existence in Hades. In early times very few were accorded a different destiny. They include the “blessed heroes”, who, according to Hesiod (*Works and Days*, 166ff.), inhabit the Isles of the Blessed. Deep in the bowels of Hades was a windy region called Tartarus to which were consigned those who had outraged the majesty of the gods. Among its prisoners was Tantalus, who served his son Pelops to the gods to test whether they could distinguish human flesh from animal flesh. Around the mid-5th century BC a more developed belief in a dualistic afterlife emerged, due largely to the popularity of the mystery religions, which offered ill-defined blessedness in the hereafter for initiates. Principal among these was the Eleusinian Mysteries. Greek religion, however, did not promote anything comparable to the Christian notion of “weeping and gnashing of teeth” for those who failed to secure such blessedness.

The quality of life in Hades is well summed up by Achilles’ observation to the effect that he would rather work as a daylabourer for a man who had little property than be lord of all the spirits of the dead (*Odyssey*, 11. 489–91). When encountered in the underworld, the dead appear to be frozen in a time warp. Ajax, for instance, is unable to forget the rancour that he feels towards Odysseus for having been beaten in the contest for the arms of Achilles. Equally pathetic is their preoccupation with the welfare of those who have survived them. The dead were believed to remain at the same age and in exactly the same physical condition that they were at the moment of death. Oedipus, for instance, states that the reason why he blinded himself was so that he would not have to look upon the faces of his parents in the underworld (Sophocles, *Oedipus Tyrannus*, 1371–73). Even so, it was infinitely preferable to enter Hades than to pass all eternity between two worlds. Especially to be pitied were the unburied dead. “Bury me as quickly as possible,” Patroclus requests of Achilles (*Iliad*, 23. 71ff.), “so that I may enter the gates of Hades.” In Sophocles’ *Antigone* denial of burial is represented as an offence against the gods.

The Greek notion of Hades was taken up and developed by the Romans, notably by Virgil in *Aeneid* book 6. In the Septuagint Hades is used to translate the Hebrew word “Sheol”. In Christianity the term is sometimes used of the place to which Christ descends after the

Hadrian ^{AD} 76–138

Roman emperor

In an age of Roman philhellenism, Hadrian, the only Roman emperor (reigned ^{AD} 117–38) known to have been honoured with a statue in the Parthenon, was himself unusually actively philhellenic. In youth his interest in Greek studies had earned him the nickname “Graeculus”. In ^{AD} 112 he was archon at Athens, where his friends included Arrian; he may also have met Epictetus at this time. After his accession as emperor in ^{AD} 117 he spent considerable periods in the Greek east; among the many instances of the Hellenic emphasis of his life are his wearing a beard (he was the first Roman leader to do so for many generations), his inclusion of a Poecile, a Tempe, and other Greek elements in his villa near Tibur (Tivoli), his initiation into the Mysteries of Eleusis (to which, according to Aurelius Victor, he continued to devote himself, back in Rome in the 130s, “after the manner of the Athenians”), and his “Greek love” relationship with Antinous (whose cult, fostered by Hadrian after Antinous’ drowning in the Nile in ^{AD} 130, was particularly popular in Greek lands).

Hadrian – like many contemporary and earlier Romans and Greeks – sought to recover the Greek past. He delighted Greeks including Pausanias by restoring the tomb of Epaminondas. He gave back Mantinea its name after 150 years as Antigonea. In taking the name “Olympios” he associated himself not only with Olympian Zeus, whose temple in Athens he completed, but with Pericles, who had also assumed this name. In basing in Athens the Panhellenion, the all-Greek council established in ^{AD} 131/32, as in the honour he accorded to such cities as Sparta and Argos, he emphasized past glories, aiming perhaps, as Spawforth and Walker argue, to redress the balance between Achaea and Asia, between “cultural and historical eminence” and “economic and political muscle”. (In Asia too, however, he was a benefactor during his visits of ^{AD} 123–24 and 129 to cities including

Sardis, Smyrna, and Ephesus; Orestia was refounded as Hadrianopolis (Adrianople); at Cyzicus the emperor began the spectacular completion of the temple; Asian foundations included Hadrianutherae (modern Balıkesir) in Mysia.)

Hadrian also, of course, sought to Romanize the Greek past or at least to recreate it, as Swain suggests, “in its idealised form” – “making Greece how it should be”. In increasing the power of the Areopagus, for instance, he made the Athenian constitution more archaic – but “to the advantage of Rome and the local elite”. Tested loyalty to Rome as well as authentic Greekness were conditions for cities wishing to belong to the Panhellenion; as Spawforth and Walker say, the cities’ familiar preoccupation with questions of civic origin was transformed “at least indirectly, into a Roman concern ... encouraging a contemporary perception of the Greek past and the Roman present as complementary rather than mutually exclusive”. Whatever the exact nature and functions of the Panhellenion – whether it was a new outlet for the social and political aspirations of upper-class Greeks (Spawforth and Walker) or rather “essentially a religious organisation, devoted above all to the cult of Hadrian and later emperors” (Jones) – it clearly involved a relationship between, negotiation between, Greeks and the empire. Hadrian’s gate in Athens links and honours old and new with its inscriptions, on one side “This is Athens, once Theseus’ city” and on the other “This is Hadrian’s city, not Theseus”.

Similarly the buildings of Hadrianic Athens can be seen as “a stylish mixture of Greek and Roman traditions appropriate to the physical setting of a Panhellenic League founded by a Roman emperor” (Spawforth and Jones). Building went on for many years after Hadrian’s visits of AD 124–25, 128–29, and 131–32, but among the first works to be begun may have been the temple of Olympian Zeus or Olympieion (in the *temenos* (precinct) of which the Panhellenion may have met), originally begun under Hippias and Hipparchus in the 6th century BC, and dedicated by the emperor in AD 132. The temple was built on a lavish scale, as is still apparent from its remaining columns. It was particularly renowned for its statues, including the ivory and gold cult statue, “worth noticing”, according to Pausanias, “as it exceeds all other statues in magnitude except the Rhodian and the Roman colossi”. At about the same time, probably, work began on Hadrian’s Library or Stoa. This, says Pausanias, boasted 100 columns of Phrygian marble “and pavilions with gilded roofwork and alabaster, decorated with statues and paintings”. Hadrian also built the aqueduct from Mount Parnes to the Agora, temples of Zeus Panhellenios and Hera, a gymnasium – 100-columned again, says Pausanias – a Pantheon, and, in the northeast corner of the Agora, a basilica.

Hadrian's cultural investment in Athens helped to transform it, during the course of the 2nd century, from "a provincial backwater by comparison with the great capitals of the eastern provinces at Antioch, Ephesus, or even at Corinth" (Shear) to a major and increasingly cosmopolitan centre. It became also, perhaps more directly as a result of Hadrian's personal initiatives, what Spawforth and Walker argue was "the agonistic centre of the Greek world": between AD 128 and 132 he founded the Panhellenia, the Hadrianeia, and the Olympieia and made the Panathenaia of equal status with these games. Perhaps even more helpfully, he provided the city with an annual grain supply. Already by AD 124–25 he had done enough for Athens for the city to reciprocate by doing him the unusual honour (last conferred on Attalus I of Pergamum in 200 BC) of creating the new *phyle* (tribe) Hadrianis; although this was possibly prompted in part by Rome or self-interest, it can scarcely have been a controversial decision.

The one area of the empire where Hadrian's Hellenism did not easily achieve the desired results was Judea, where the prohibition of circumcision and the decision to transform the ruins of Jerusalem into the *colonia* of Aelia Capitolina were among the main causes of the rising of AD 132–35 (indicating, for Birley, "that his Hellenism had blinded him to reality"). Elsewhere Greek influence was, increasingly, unopposed; Hadrian made a substantial contribution to this already powerful process, not only within the Greek lands but as the first emperor to "persuade the Greeks of old Greece to enter the Senate" and to appoint Greeks to govern provinces in the Latin west (Birley).

MARTIN GARRETT

Biography

Born in AD 76 in Spain, Hadrian was nicknamed "Graeculus" in youth for his devotion to Greek studies. In 112 he served as archon at Athens. He became emperor in 117 and spent long periods in the east where he sought to recover (and to Romanize) the Greek past, transforming Athens into a great eastern capital. He wore a beard to emphasize his Hellenism; he introduced Greek decor into his villa at Tivoli; he was initiated into the Mysteries of Eleusis; and he enjoyed a "Greek love" relationship with his friend Antinous. He died in 138.

Halicarnassus

City in southwest Asia Minor

Halicarnassus (modern Bodrum) was a Greek city in Caria in southwest Asia Minor, traditionally founded c.900 BC by the city of Troezen in the Argolid region of mainland Greece. With a superb sheltered position on the Mediterranean coast, the orientation of Halicarnassus was naturally outwards towards the Aegean rather than inwards towards the mountainous areas of inland Caria. The city had close ties with other east Greek cities given its position on shipping routes connecting them. In the Archaic period Halicarnassus was one of the cities of the “Dorian Hexapolis” (a loose federation of six cities of Dorian Greeks, which also comprised Cnidus, Cos, and the three cities of Rhodes, Lindus, Camirus, and Ialysus), but by the Classical period the city was Ionian with strong native Carian elements, although Caria as a whole was ruled by a local dynasty subject to the Great King of Persia. Herodotus, the Greek historian of the 5th-century BC wars between the Greeks and the Persians, was a native of Halicarnassus.

Given Persia’s suzerainty in the region, Halicarnassus took part in the Persian Wars on the Persian side. The Carian dynast Artemisia I with five ships accompanied the invasion of Greece by the Great King Xerxes in 480 BC, and played a distinguished part in the sea battle off Salamis (recounted by Herodotus, 8. 88), although the battle was a Greek victory. Later, Halicarnassus became a member of the Delian league under the leadership of Athens, and served as an Athenian naval base at the end of the 5th century.

The 4th century BC was the zenith of Halicarnassus. The dynast Mausolus, who became the Persian satrap after Halicarnassus returned to Persian control in 386 BC, moved his capital there from the inland city Mylasa c.370 BC, synoecized (united into one city) neighbouring non-Greek settlements, and embarked upon an ambitious building programme to transform Halicarnassus into a grand city. He built fortification walls, a palace, harbour installations, a Greek-style theatre, various public buildings, and revealed a considerable familiarity with, and appreciation of, Greek culture. He meddled in 4th-century Greek politics in the Aegean to the detriment of the Second Athenian Confederacy, and extended his influence in Asia

Minor and the Aegean.

Halicarnassus was justly famous for the great tomb of Mausolus, known as the Mausoleum, probably begun during his lifetime and completed c.350 BC after his death. This monument was a major achievement of Greek art and was considered one of the seven wonders of the ancient world in Hellenistic and Roman times. Built in a commanding position overlooking the harbour, the tomb would have dominated the city and served as a landmark to seafarers. Information about the Mausoleum is derived from ancient literary descriptions and extensive excavation, and, although it has been variously reconstructed, it essentially consisted of an Ionic colonnade atop a high square podium, surmounted by a pyramidal roof. The building was adorned with quantities of free-standing sculpture and several relief friezes. Mausolus had the money and influence to employ the leading Greek sculptors of his day (among them Scopas of Paros, Leochares of Athens, Bryaxis, and Timotheus). The pyramidal roof was a striking feature, perhaps inspired by eastern prototypes (the pyramids of Egypt have been proposed as among the Mausoleum's forerunners).

The Mausoleum had many imitators. To name but a few: Alexander the Great (who surely saw the Mausoleum when he besieged Halicarnassus – see below) built at Babylon an immense pyramidal tomb composed of six stepped levels for his beloved companion Hephaestion after his death in 324 BC. Moreover, Alexander's proposed "Last Plans" (if genuine) included a pyramidal tomb for his father Philip II (Diodorus Siculus, 18. 4. 5). Finally, the famous Lion Tomb in the independent Greek city Cnidus, which lies at the tip of a peninsula just south of the Bodrum peninsula, was topped by a stepped pyramid supporting a platform for an enormous recumbent lion.

The smooth course of Alexander the Great's progress down the east coast of Asia Minor during his invasion of the Persian empire was interrupted when Halicarnassus offered resistance, but the city finally fell in 334 BC after a difficult siege (vividly described in Book 1 of Arrian's *Anabasis*). After Alexander's death, Halicarnassus – like other Greek cities in Asia – could not escape the power struggles of his successors, and it was subject at various times to the new Graeco-Macedonian Hellenistic kingdoms (the Ptolemies of Egypt, the Seleucids of Syria, and the Antigonids of Macedonia) as well as to the independent Greek island of Rhodes. It became part of the Roman province of Asia in 129 BC.

Harbours

Because the Greeks have been a seafaring people since before recorded history, harbours have always played an important part in their life. Certainly the rocky terrain of mainland Greece, and settlement on the islands of the Aegean, encouraged travel by sea as opposed to travel by land. Yet, as Lionel Casson, the naval historian, points out, it was possible to load and unload ships lying off an open beach without using harbour installations until well into the 19th century AD, so the absence of harbours did not necessarily preclude a city or island from participating in seafaring. In the early days, ships could even be drawn up on to shore, literary evidence of which can already be found in the *Iliad* and *Odyssey*, presumably composed in the 8th century BC. Nevertheless, the importance of harbours even at this early date may be reflected in the fact that Nestor led to Troy 90 ships, the second biggest contingent of the Greeks after Agamemnon's 100, according to the catalogue of ships in book 2 of the *Iliad*. (Indeed, some scholars have argued that the catalogue of ships may reflect an actual Mycenaean order of battle for some historical event underlying the myth of the Trojan War.) According to tradition Nestor was also associated with the magnificent natural harbour at Navarino bay in the western Peloponnese, while archaeological finds have linked him with the Bronze Age palace found near the bay.

The *Odyssey* depicts the mythical Phaeacians as living almost in a fairy-tale land, and, among their many blessings, endows them with an idealized harbour consisting of a protective bay with sheds for the

storage of sails and rigging, stone bollards for tying ships to, work space for sailmakers, riggers, and ship-wrights, and a shrine to Poseidon, surrounded by a meeting place (*Odyssey*, 6. 263–69). These features may be taken as the desiderata of a Greek harbour of the Archaic period. Actual harbours did not lag far behind this poetic one, and soon surpassed it, as in the harbour at Delos with its 8th-century ^{BC} mole, 100 m long, constructed from rough-hewn granite blocks. The Phaeacians depended on nature alone for a protected anchorage. At the end of the 6th century ^{BC} the tyrant Polycrates built a harbour at Samos comprising two moles, one 370 m long and the other 180, and included it within the circuit of the city's defence wall (Herodotus, 3. 60). Also at the end of 6th century ^{BC}, according to the pseudo-Aristotelian *Constitution of Athens*, the tyrant Hippias began fortifying Munychia in the Piraeus, even though Athens continued to use the open roadstead at Phalerum as a harbour until about 493 ^{BC}.

At the beginning of the Classical period the ideal Greek harbour had moles (*chomata*) to provide a safe anchorage (*hormos*). A commercial harbour (*emporion*) had quays, open sheds (*neosoikoi*), and warehouses, whereas a naval base (*neorion*) had boathouses (*neosoikoi*) and gear sheds (*skeuothekai* or *hoplothekai*). Defence towers stood at the seaward end of the moles and, being brought within the circuit of the town wall, made it a protected harbour (*limen kleistos*). In fact, several cities in the Classical period went so far as to join their harbours to their cities with long walls, most famously Athens and the Piraeus, Corinth and Lechaëum, its port on the Corinthian Gulf, and Megara and Nisea, its port on the Saronic Gulf. In the Piraeus, Pashalimani (ancient Zea) and Tourkolini (ancient Munychia) in the Piraeus were *neoria*, whereas Megas Limin (ancient Cantharus) served as both an *emporion* and as a *neorion*, as indeed it still does today. The presence of the harbours, and their use as commercial and naval centres for Athens beginning in 493 ^{BC} with Themistocles' founding of a navy to repel Xerxes' invasion, led to a lot of construction in the Piraeus. In about 450 ^{BC} Hippodamus of Miletus imposed an orthogonal city plan on the Piraeus which is still reflected in the layout of the modern streets.

Pashalimani in the Piraeus has the best-preserved boathouses, served by a stone slip c.3 m wide and 37 m long. (From these dimensions Morrison and Coates have derived the size for their recent reconstruction of the trireme.) The boathouses' roof was supported by columns each just under 6 m wide; the use of columns instead of a solid wall allowed for ventilation. The boathouses stored ships and wooden gear (masts, yards, poles, ladders, and oars). Oeneia in Acarnania had longer boathouses with bevelled slips to fit the ships' bilges, and they are therefore thought to have accommodated

quadriremes or quinqueremes, larger than the triremes presumably housed at Pashalimani. The Piraeus also had an elaborate gear shed, built in the 4th century BC and known as the arsenal (*skeuotheke*) of Philon; considered something of an architectural wonder, its details are known to us from an inscription (IG 22, 1668). By the end of the 5th century BC, the essential elements of the commercial harbour in the Greek world had been worked out, becoming more elaborate and increasing in size in later centuries.

The harbours of the Hellenistic age were of vast size and integrated plan. The premier harbour of the period was of course at Alexandria, the city Alexander the Great founded in 330 BC and named after himself. Its plan was crowned by the famous Pharos, a lighthouse which was one of the seven wonders of the ancient world and the light of which could be seen from about 50 km away. There were two basins at Alexandria, the Great Harbour, which faced east, and the Eunostos, which faced west. The Great Harbour was formed by two stone moles (one of which was 900 m long), the tips of which were 600 m apart, though underwater obstacles reduced this opening to two entrances, 100 and 200 m wide, respectively. Such a plan, dominated by a lighthouse, probably influenced the Roman emperors Claudius and Trajan in developing the facilities at Ostia for the reception of the grain fleet from Egypt, for, when Trajan had finished with it in the early 2nd century AD, Ostia also had two harbours dominated by a lighthouse.

Also in the Hellenistic age, Delos became a commercial centre for trade in the Aegean, as well as continuing to be an important shrine to Apollo. Inscriptions show that it was a centre of the slave trade, and the Romans deliberately fostered it as a trading rival to Rhodes, expelling the Delians in 166 BC and replacing them with Athenian settlers. In 146 BC Corinthian importers moved there from their own city which had been sacked by the Romans, and the religious festival in honour of Apollo on Delos practically became a trade fair. Delos, however, never recovered from the depredations of Archelaus, the general of Mithridates of Pontus, and pirates in the 1st century BC, and went into a slow decline thereafter.

Healing Cults

A genuine human desire to turn towards higher, spiritual forces beyond “scientific” medicine in times of illness and distress manifested itself very early in Greek culture. Already Linear B tablets from Knossos are addressed to “Paieion” (“Pa-ya-wone”) who receives votives of limbs in Palaikastro about 1600 BC (Middle Minoan) and is the doctor of the gods also in the *Iliad* (5. 401, 899f.); he will later amalgamate with Apollo. Apollo’s son Asclepius is still a mortal in the *Iliad*, but already a “doctor without fault” (4. 194); not only his two sons, Machaon and Podalirius, but also other heroes such as Patroclus act as physicians if the need arises. Likewise the seer (and later healing hero) Amphiaraus was originally a battle hero, participating in the war of the “Seven against Thebes”; when his army was routed, Zeus would not let his seer die, but conveyed him into the underworld alive by splitting the earth before him. Afterwards, Amphiaraus was revered as a healing and oracle-giving hero, with musical and sports contests (Amphiareia) being held in his honour.

The overall increase of hero cults in the 7th and 6th centuries BC also led to an intensified worship of healing heroes. Above all in Attica there existed plenty of healing gods and heroes, among them heroified historical persons (e.g. Hesiod in Orchomenus; in Athens, Sophocles became the hero Dexion, after he had received the god Asclepius). Almost every other god and goddess could assume healing functions, too, above all Apollo; Artemis cared especially for pregnant women, newborn babies, and young children, and Athena was already in the 6th century BC worshipped as “Athena Hygieia” on the Acropolis.

This variety of healing cults was very much reduced when from about 420 BC onwards Asclepius became the most prominent healing god. His cult first seems to have existed in Thessaly (Trikkha) and Messenia; his most important place in the later 5th century BC was Epidauros, whence the cult spread to Eleusis, Delphi, Paros, Corinth, Cos, Pergamum, and in 420 BC (during the plague) to Athens; in these transfers, Asclepius’ holy snake was brought by ship or cart to its new place. The only other healing cult that continued was that of Amphiaraus; his main sanctuary was the Amphiareion in northeast Attica, with a branch established in Athens itself near the Theseum between 377 and 375 BC. Iconographically Asclepius is often represented as a bearded elderly man wrapped in a garment and carrying a stick (Amphiaraus is similarly depicted from the 4th century BC) and together with his family: his wife Epione, his sons

Machaon and Podalirius, his daughters Hygieia, Aegle, Aceso, Iaso, Panacea, and later also with a dwarf called Telesphorus (“who brings to a good end”) who is either his son or his servant.

In Hellenistic and Roman times, healing cults and Asclepieia spread through the whole Aegean and beyond. The increasing popularity of these cults coincided with the rise of scientific medicine, which may seem paradoxical at first sight. The basic attitude of ancient doctors was different from that of today. According to Hippocrates, a physician has to do three things: first, to describe the case; second, to draw conclusions about the kind of illness; and finally to decide either “I will treat this illness” or “I won’t treat it”. In the latter case the sick needed an alternative to whom they could turn, and at this point healing gods and heroes came in.

The best-preserved healing places – the above-mentioned Amphiareion near Oropus (not far from the Boeotian border) and the Asclepieia in Epidaurus and Cos – all show the same main elements: the sanctuary of the god, an incubation hall (see below), baths, a theatre, and guesthouses for the pilgrims; most of these buildings were constructed in the 4th century BC, when the importance of healing cults reached a first climax. The famous theatre of Epidaurus has space for 15,000 spectators, a measure of the immense popularity of the cult. Such additional amenities created the atmosphere of a “holiday resort” and may have been important for the well-being and curing of the visitors. Certain rules of behaviour had to be observed; dying people or women giving birth were denied access, for they would cause religious impurity.

Healing was mainly sought by the process of “incubation”, i.e. sleeping in the sanctuary. The patients first had to make a purificatory offering, sacrificing an animal at the altar in front of the temple. After physical cleansing in the baths, patients laid themselves down to sleep on the skin of the sacrificed animal in the *koimeterion* or “incubation hall”, a long columned hall, which could be partitioned into small compartments. The god then approached people in their dreams by touching them either with his own hand or with one of his holy animals, the snake or the dog (both already companions of oriental healing gods), which bit or licked the spot where the patients were suffering. The healed placed votive offerings – imitations of limbs in various materials and reliefs depicting the healing – in front of the temple; when the more precious items (in gold, silver, and bronze) were later melted down, an inscription noted the shape of the votive, its donor, and its weight. Tales of miraculous healings were preserved on wooden or marble tablets; in Epidaurus they were collected and inscribed on big marble stelai (1.70 × 0.75 m) in the second half of the 4th century BC; three of these, containing 130 healing miracles, are

still extant. It is difficult to form an adequate judgement of these “miracles”; but as modern medicine has long since acknowledged the importance of psychological factors in healing, one should not talk of “cheating”, as scholars did in the 19th century. Frequently mentioned in these tales are eye complaints (in the *Plutus* of Aristophanes, the god of wealth himself is cured of his blindness in the course of a very funny incubation), paralysis, speech disorders (the god often cures muteness by a sudden shock), ulcers, abscesses, old sores (in the case of which the god often performs spectacular surgery), and everything connected with pregnancy and desire for children. Interestingly, Christian tales of miraculous healings by saints (as found in records from their holy places) are very similar to these pagan ones; even in our time, observation (in places such as Lourdes) has shown that religious ecstasy can induce spontaneous healing.

There was a second flourishing of healing cults in the 2nd century AD, with the Asclepieion of Pergamum being one of their foremost places; even leading intellectuals such as Aelius Aristides eagerly sought their help. Healing divinities preserved their appeal well into the mysticism of late antiquity; by the 4th and 5th century AD, however, they were increasingly superseded by Christianity (with Christ himself often acting as healer).

Health

The standard Greek words for health (e.g. *hygieia*, *euexia*) do not

appear in Homeric and Hesiodic epic, but “disease” (*nousos/ nosos*) is a significant theme ever since the tenth line of the *Iliad*, and freedom from disease is depicted as belonging to a faraway land (*Odyssey*, 15. 407–08) or to a lost golden age (Hesiod, *Works and Days*, 90–126). Once the Greeks developed more fully articulated conceptions of “health” in the Classical and Hellenistic periods, they disagreed vigorously among themselves about how to define it, how to achieve it, and where to rank it among the human goods.

1. *Conceptions and definitions of health.* Balance, harmony, due proportion, equilibrium, regularity, and proper mixture or blending (“temperament”) were central to the Greek understanding of health in most epochs, but there was no consensus on exactly what constitutes a “harmony”, a healthy blending, etc. Furthermore, a significant minority adopted a very different approach to health. The 5th-century BC philosopher-scientist Alcmaeon of Croton might have been the first to claim that the “equal rights” (*isonomia*) of opposing qualitative powers (moist–dry, cold–hot, bitter–sweet) in the body preserves health, whereas a “monarchy” of any single such power causes disease (but the late 1st-century AD doxographic text that attributes this view to Alcmaeon displays suspect, anachronistic terminology). This conception of health recurs in Greek philosophical and medical texts until the Early Modern period. According to the Presocratic Diogenes of Apollonia, for example, health depends on a proper mixture of blood and air in the body, while the Hippocratic treatise *On the Nature of a Human Being* argues that health exists to the greatest degree whenever four juices or humours “that are in the body” – blood, phlegm, yellow bile, black bile – achieve the right quantitative and qualitative proportions relative to one another. For all their strong disagreements about the basic constituents of the human body, several other Hippocratic texts (e.g. *On Ancient Medicine*, *On Regimen*) as well as Empedocles, Democritus, Philistion of Locri, Plato, Aristotle, Galen, and most Byzantine physicians and philosophers shared this fundamental theory that good health is due to a right blending (*krasis*) or balance of constitutive elements or qualities or substances, whereas disease is due to a rupture of such a blending or balance, resulting in a separation or disproportion of elements, etc.

The quantitative implications of balance and proportionality sometimes were given mathematical expression, notably by the Pythagoreans. They not only characterized health as a harmony and an “equality of parts” (*isomoiria*) of opposites but also called their “perfect number” – the decadic *tetraktys* (i.e. 10 as the sum of 1, 2, 3, and 4) – “the principle (*arche*) of health” and referred to their mathematical symbol of identity (a pentagram) as “health”. Furthermore, they advocated the use of music, which they viewed as a

mathematical phenomenon, to maintain or restore harmony in the body. Some of Plato's theories of due proportion and mixture are not unrelated to the Pythagoreans' mathematicizing versions of health, but Plato perhaps elaborated the moral and aesthetic dimensions of such a conception more fully, closely correlating health, the well proportioned, the good, and the beautiful (e.g. *Timaeus*, 87c–d).

"Health of the soul" (*psyche*) was often explained in the same terms as physical health. Indeed, a number of Greeks, early and late, viewed health as a condition or disposition of a unitary psychosomatic entity. Closely related was the popular association of physical and mental health with moral uprightness (and, correspondingly, the attribution of diseases, including mental disorders, to moral failings, a recurrent notion in Greek popular culture of all epochs, especially when accompanied by the ascription of illness to divine intervention). Many physicians, including some Hippocratics, Aretaeus of Cappadocia, Soranus of Ephesus, Galen, and later writers, explained mental health by reference to relations or interactions between material elements or substances in the body. At times, however, philosophers – including those who, unlike Plato, offered a materialist account of the soul – attempted to draw sharp distinctions between physical and mental or "psychic" health. Some Stoics, for example, defined the health of the body as a good blend (*eukrasia*) or due proportion (*symmetria*) of the four elementary qualities (hot, cold, wet, dry) but the health of the *psyche* as a good blend of the opinions of the soul.

2. *Attaining and maintaining health.* The theories of balance, harmony, and proportionality are closely related to a broader ideology of moderation. Critias, for example, suggested in an elegy that the moderate drinking practised by the Spartans is fitted beautifully to health and to the works of Aphrodite, sleep, and temperance ("the neighbour of piety"), while Xenophon attributed the extraordinary health of the Spartans to their moderate eating habits. Similarly, in a comic fragment of Eubulus, Dionysus limits those who are healthy in mind to three kraters of wine: the first for health, the second for eros, the third for sleep; with the fourth krater, he says, one leaves the realm of Dionysus and enters that of hubris. Several Hippocratic treatises (e.g. *Affections*, 49) similarly claim that smaller quantities of food are better for one's health. The frequent ancient Greek criticisms of the excesses characteristic of athletes' diets and exercises, and so too the clear distinction drawn by some physicians between steady good health and exceptional physical strength, are further manifestations of a wide-ranging cultural valorization of moderation, even if there often were considerable gaps between belief and practice.

Starting in the 5th century BC a sizeable body of Greek literature

developed on the preservation and restoration of health by means of regimen (*diata*), i.e. by a stable mode of living, including diet, exercise, bathing, and other regular habits. Herodicus of Selymbria was widely regarded as being among the founders of this tradition, but the 5th-century BC Hippocratic treatise *On Regimen* is the first extant work offering detailed, comprehensive norms for human regimen with a view to health, while also taking account of individual differences in age, gender, season, constitutional type, location, environment, etc. The fundamental tenets of this Hippocratic text remained a cornerstone of much subsequent work on regimen. Many of its prescriptions entail self-control, also in matters of eating and drinking, and this has suggested to modern scholars that its audience – like that of most ancient and Byzantine treatises on health through regimen – was assumed to have an ample food supply. In reality, food shortages were endemic in the ancient Mediterranean, even if not all food crises were severe. The primary audience of the extensive Greek medical literature on regimen therefore probably was a literate socio-economic elite. Palaeopathological analyses of skeletal remains confirm that certain nutritional deficiencies were common throughout antiquity. Not all such deficiencies are attributable to catastrophic food crises (nor are all recurrent congenital diseases, rheumatic ailments, cases of dental caries, etc.), but it is nonetheless striking that evidence of deficiency, also in children, is at least as common as evidence of dietary excess, even at times of economic prosperity.

Other Greek writers on achieving health through regimen include Acron of Agrigentum, Philistion of Locri, Diocles, Mnesitheus, Dieuches, Praxagoras of Cos, Herophilus, Erasistratus, members of the Empiricist “school”, Galen, and numerous early and late Byzantine authors, e.g. Oribasius (especially books 1 and 4), Hierophilus the Sophist (*On Nutriment according to the Months*, i.e. the months of the Julian calendar, and *On the Faculties of Nutriment*), and Symeon Seth.

None of these works was more influential than Galen’s monumental *Health (Hygieina)* 1–6 and *On the Faculties of Foods* 1–3. In *Hygieina* Galen assigned the preservation of health to “hygiene” (“the art of health”) but the restoration of health to therapeutics. His *Health* is based on the classical theory of a due proportion and blending of four primary qualities (hot, cold, wet, dry) and of four humours. Not every deviation from the normal humoral proportions results in a disease; like several precursors, Galen adopted the notion of relative health. Health can range from an ideal condition to one just short of disease. This latitude leaves room *inter alia* for the different temperaments or humoral blendings characteristic of different humans in a normal healthy state and for the 40 different normal human constitutions accommodated in Galen’s physiopathology. Food, drinks, exercise,

rest, bathing, massage, the surrounding air, sleeping, being awake, excretions, and emotions are interactive factors that can be regulated quantitatively and qualitatively by “hygiene” to preserve health in different human types and under different conditions.

3. *Health and human values.* While there was a broad consensus in most epochs that health should be classified among the goods (*agatha*) or among the excellences or “virtues” (*aretai*) of the body, there was less agreement about its value relative to other goods. In popular morality health often is given first place. A drinking song, for example, ranked health first, beauty second, and wealth third (Plato, *Gorgias*, 451e1–452d4). Isocrates’ hierarchy was health first, then prosperity, then being honoured as a morally good person; and the comedian Philemon (c.368–267 BC) ranked health first, prosperity second, pleasure third, and owing no debts fourth. Among the maxims attributed to Menander is also the transculturally recurring claim that “nothing is better in life than health”. It is hardly surprising that Hippocratics agree that health is worth the most to human beings (e.g. *Regimen in Health* [in *Nature of a Human Being*]).

A related but logically different valorization of health is the depiction of health as a necessary condition of all other human goods. In a paean to the goddess Hygieia (Health), Ariplion of Sicyon (5th–4th century BC), for example, sang “without you no one is happy”, claiming that Health alone makes possible the joys of wealth, children, political power, and eros. This commonplace is found in a variety of genres, including medical treatises. The Hellenistic physician Herophilus, for example, depicted the actualization of all human goods – those of the soul, of the body, and external ones – as dependent upon health.

Not all Greeks agreed, however, that health should be accorded first place among the goods. Philosophers, in particular, challenged this popular view. Grantor (c.340–275 BC) envisioned a Panhellenic theatre in which personifications of four traditional goods vied for first prize in an oratorical contest. The audience awarded first prize to Courage, second to Health, third to Pleasure, and fourth to Wealth. And in Plato’s *Republic* (9) Socrates argues that a wise person will not make physical health a chief aim but will rather subordinate the interests of the body to those of the soul; harmony in the body should merely be in the service of harmony in the soul. Similarly, in Plato’s *Laws* (1. 631b6–d6) the Athenian stranger ranks four “divine” goods – wisdom, moderation, justice, courage – above four “lesser human” goods, viz. health, physical beauty, physical strength, and prudent wealth. Aristotle, too, proposed a hierarchical distinction between goods or virtues of the soul (which in turn are subdivided into intellectual and moral virtues), goods of the body (health here being valued more

highly than strength and beauty), and external goods. The Stoics went further, arguing that health, though preferable, is neither a virtue nor a vice but morally indifferent (*adiaphoron*).

4. *Health and religion*. The remarkable popularity of the cult of Asclepius in all parts of the Greek world did not eclipse the many other divinities associated with health. *Hygieia* ("Health"), for example, appears as an epithet of Athena as early as 500 BC and, slightly later, as the personification of an attribute of Aphrodite, as a divine daughter of Asclepius, and as an independent goddess. Sometimes Health also shared cult sites with Dionysus, Tyche, and other deities. The Greeks' relation to *Hygieia* and to other gods of health expressed itself in sacrifices and prayers that signalled an expectation not only of health but also of the enjoyment of other physical, mental, and material "goods" (including especially eros and "blameless wealth"). Criticism of the use of religious practices to achieve health was occasionally voiced by philosophers (e.g. Democritus and Diogenes of Sinope), and magicians and charlatans were explicitly denounced by Hippocratics. But many representatives of scientific medicine, including several Hippocratics and Galen, explicitly accepted the therapeutic role of religion, notably of Asclepius and of prayer, much as some Byzantine writers transmitted scientific theories of health, even while worshipping Christ as Healer and while accepting a Christian body-soul dualism that devalued physical health and privileged Christ as physician of the soul. About paganism in the Roman empire it has been remarked that "the chief business of religion....was to make the sick well" (MacMullen, 1981). Early and Byzantine Christianity likewise recognized the pervasive longing for mental and physical well-being and, by addressing this desire both theologically and practically (e.g. through care of the infirm and "hospitals"), it rendered Christ a victorious successor to Asclepius, even as Byzantine Christians transmitted Galen's science of health.

Hecataeus of Miletus

Prose writer of the 6th–5th centuries BC

Hecataeus of Miletus, son of Hegesander, the most important of the early Ionian prose writers, was active in the late 6th and early 5th centuries BC. The little that is known of his life is drawn from Herodotus, in whom may repeatedly be detected a tension between unacknowledged exploitation of and polemic against Hecataeus' work. Herodotus introduces Hecataeus in conversation with the priests of Amnon at Thebes (2. 143), an encounter which strongly suggests a symbolic force as the representative of the Ionian enlightenment confronts the custodians of Egypt's ancient wisdom. Hecataeus reappears in a very different context, playing a prominent part in Herodotus' account (5. 36, 124–26) of the planning of the Ionian Revolt (500–494 BC). His prudent opposition, based on geopolitical considerations, suggests a relatively senior figure; he does not forfeit the confidence of the leaders of the liberation movement by his

disapproval of their strategy, and his clear-sighted estimate of their chances demonstrates the value of geographical study for those who want to serve their fellow citizens. There is reason to doubt the historicity of Hecataeus' role in both these episodes; the prominence which Herodotus here affords Hecataeus should perhaps be seen primarily as a tribute to one whom he recognized as his intellectual precursor.

Besides improving Anaximander's map of the world, which he envisaged as a flat disc encircled by the river Oceanus, Hecataeus wrote a pioneering work of systematic geography, the *Periegesis* or *Periodos Ges* ("Journey Round the World"), divided into two books, "Europe" and "Asia" (the latter including Africa). The *Periegesis* provides information about the places and peoples to be encountered on a clockwise coastal voyage round the Mediterranean and the Black Sea, starting at the Straits of Gibraltar and ending on the Atlantic-coast of Morocco, with diversions to the islands of the Mediterranean and inland to Scythia, Persia, India, Egypt, and Nubia. In addition to the enumeration of peoples and their territorial boundaries, of rivers, mountains, bays, towns and harbours, Hecataeus on occasion notes other items of interest, such as strange customs (e.g. fr. 154, 284, 287) and legendary history (e.g. fr. 76, 129); but if his geographical work could be adequately accommodated in two rolls without further subdivision, he cannot often have gone into much detail. We owe to Hecataeus the familiar description of Egypt as the gift of the Nile (fr. 301; cf. Herodotus, 2. 5. 1, Arrian, *Anabasis*, 5. 6. 5). It is uncertain how far his information was based on his own first-hand observations and inquiries; Miletus, with its extensive colonial network and overseas trade, would have been an ideal environment in which to gather geographical data. We might wonder, too, whether he was indebted to topographical and ethnographical information assembled by the Persian administration. It is difficult to assess how much Herodotus owed to Hecataeus' work, and, though much subsequent geographical writing probably drew on it, precise debts are hard to identify. Over 300 fragments of the *Periegesis* survive, the two parts of the work being about equally represented; but many are merely citations in Stephanus of Byzantium recording the occurrence of a place name in the *Periegesis*. Callimachus regarded as spurious the text of *Asia* known to him (T 15: Athenaeus 70A, 410E; Arrian, *Anabasis*, 5. 6. 5), presumably the source of citations in later authors; we do not know his reasons, but it is likely enough that a topographical work would be tacitly brought up to date so long as it was felt to have some practical utility, and he may have been troubled by references to places beyond the horizons of a writer active around 500 BC.

We do not know whether Hecataeus' geographical work preceded or

followed his mythographic treatise, the *Genealogies* (or *Histories* or *Herologia*). This comprised at least four books, but fewer than 40 fragments survive (and some of those conventionally assigned to the *Genealogies* by reason of their subject matter may belong to foundation legends related in the *Periegesis*). The opening of the *Genealogies* proclaims Hecataeus' intellectual independence, and rather suggests that he was influenced by contact with foreign traditions (fr. 1): "Hecataeus of Miletus speaks thus. I write what seems to me to be true; for the Greeks have many tales which, as it appears to me, are absurd." His subject was the legends of families claiming a divine origin (including, apparently, his own (Herodotus, 2. 143)). It is not clear whether his terminus was the Trojan War, or whether he continued to include material relating to the sons of the Homeric heroes; but it should certainly not be supposed that he regularly attempted to follow genealogical traditions down to his own day. In the *Genealogies* legends of the heroic age are transposed into the sober rationalism appropriate to prose; the methods of Ionian science are applied to the legendary past. As is shown by his treatment of Geryon (fr. 26), who is relocated from the far west to Ambracia, and of Cerberus (fr. 27), identified as a formidable snake, called the hound of Hades because of its lethally poisonous bite, Hecataeus evidently believed that behind the fabulous elaborations of tradition lay historical facts distorted by exaggeration or by literal interpretation of metaphorical expressions. Whether he pioneered this demythologizing approach we cannot tell, but certainly it proved immensely influential; Herodotus' treatment of the foundation of Dodona (2. 54-57) well illustrates its application, and Rudolf Bultmann's work on the New Testament demonstrated that still in the mid-20th century the method retained its attraction not only for journalists but even for serious scholars.

Dissimilar as the subject matter of his works may at first sight appear, both alike serve as intermediaries between Archaic catalogue poetry and the more sophisticated methods of synthesizing information about the *oikoumene* characteristic of the 5th century BC. Here, as with many of the developments associated with Ionian intellectuals, we see the beginning of trends often regarded as characteristic of the sophistic movement. The fragments are too short to give a fair idea of his style; ancient critics regarded it as clear but much less varied and attractive than that of Herodotus.

Heraclitus of Ephesus, the approximate contemporary of Hecataeus, took a severe view of his work, including him with Hesiod, Pythagoras, and Xenophanes in his list of those who showed that much learning did not produce good sense (12B40 Diehls-Krantz).

Biography

A native of Miletus, active in the late 6th and early 5th centuries BC, Hecataeus was the most important of the Ionian prose-writers and Herodotus' most significant intellectual precursor. Besides revising Anaximander's map, he wrote a geographical work (*Periegesis*) and a rationalizing mythographic treatise (*Genealogies*), of which only fragments survive.

Heliodorus

Novelist of the 4th century AD

Author of the *Aithiopika* (Ethiopian Story), the last and most sophisticated of the ancient Greek novels, Heliodorus stands at the crossroads of Hellenism. Probably written shortly after AD 350, in the twilight of paganism, the novel itself looks resolutely backwards to Classical Greece, apparently ignoring the existence of both Rome and Christianity. By its scale – ten books – technical flamboyance, and appropriation of the canonical texts of Classical Greek literature, it seems almost deliberately set up as the final authentic masterpiece to round off the Classical tradition. The fact that it was arguably exploited by Julian the Apostate in two of his orations seems to confirm that it shares the emperor's militant nostalgia for the pagan past. And yet, according to our earliest biographical testimony, that of the 5th-century ecclesiastical historian Socrates, Heliodorus went on to become a Christian bishop who enforced strict celibacy on his clergy at Trikka in Thessaly. Whatever the truth of this report, it was instrumental in ensuring the novel's survival in Byzantium and thence its transmission to the Renaissance in western Europe, where Heliodorus was ranked alongside Homer and Virgil as a master of epic narrative. Though it is not quite what modern readers expect a novel

to be, it is, within its own terms, a masterpiece. Recent work has explored Heliodorus' innovative narrative technique, which shows rather than tells and conscripts the reader into an active interpretive role, from the enigmatic opening tableau onwards.

Heliodorus locates his novel firmly in the Classical mainstream. Although its plot follows the romantic stereotype of a beautiful young and noble couple (Theagenes and Charicleia) falling in love at first sight and enduring numerous adventures, ordeals, and attempts on their chastity before living happily ever after, the *Ethiopian Story* is both more intricate and less episodic than its predecessors. It presents its familiar story in a radically new way, by beginning in the middle and then filling in the earlier episodes by means of a long retrospective narration by one of the characters, which ends about halfway through the whole. This format is clearly modelled on the *Odyssey*, and indeed Heliodorus has also modified the standard story so that, for one of its protagonists at least, it becomes, like the *Odyssey*, a journey home, culminating in marriage and paternal recognition. Specific episodes, such as a necromancy, also recall the Homeric prototype, while the secondary narrator, an Egyptian priest called Calasiris, begins with a quotation from the *Odyssey* and is a figure of Odyssean cunning and duplicity – characteristics that inform his narrative technique as well as his actions. The novel is also permeated by references and allusions to the Athenian theatre (often in abstruse technical detail), partly as a meta-literary commentary on its own theatricality, partly as a device of characterization to distinguish between the “tragic” protagonists and “comic” secondary characters. Some episodes recall specific tragic models; for example, the subplot of his stepmother's infatuation with the Athenian Cnemon, which he narrates in the first book, rewrites the story of Hippolytus, and the events of the final book, when the protagonists face human sacrifice at the end of the earth and a king proposes to sacrifice his own daughter for the sake of his community, play on the reader's acquaintance with Euripides' two Iphigeneia plays. For the setting, Heliodorus has ransacked Classical historians and geographers: every detail of his Ethiopia, for example, can be traced to literary sources, occasionally in defiance of known reality.

The heroine of the novel, Charicleia, is an Ethiopian princess, born white to black parents, exposed at birth, and subsequently brought up as a Greek by the priest of Apollo at Delphi. The hero, Theagenes, is a descendant of Achilles and characterized as a true Hellene by his victory at the Pythian games. The couple's adventures lead them through Egypt and an encounter with the corrupt and sensual Persian occupying powers – the story is set in the 6th century BC – to Ethiopia, where the novel ends with their installation as priest and priestess of

the Sun and Moon, the Ethiopian national gods. It is difficult not to read this scenario as a coded exploration of the nature of Greek cultural or racial identity and its place in the multicultural world of the Roman empire, especially as Heliodorus, at the end of the novel, reveals himself as non-Greek, a Phoenician from Emesa. Similarly the novel's polemically pagan religious apparatus of divine governance and its basically, but unsystematically, Neoplatonic world view – with an almost abstract pure divinity mediated to humanity by a plurality of lower and often malevolent powers – combined with an untypically ascetic sexual ethic applying equally to male and female, look like a displaced engagement with the issues posed by the rise of Christianity.

If we discount an uncorroborated report by the 14th-century historian Nikephoros Kallistos Xanthopoulos, that the bishop Heliodorus had to renounce his see because he refused to disown his novel, we have no evidence for the reception of the *Ethiopian Story* before the Byzantine period. As early as the 7th century a few of Heliodorus' *sententiae* were included in the *Florilegium* of Maximos the Confessor, and from this and similar anthologies passed into Byzantine paroemiographies. His novel was read and summarized by Photios in the 9th century, discussed from a literary and moral perspective by Psellos in the 11th, and subjected to an allegorizing Christian interpretation by Philippos Philagathos in the 12th. In the same century the basic plot structure of the *Ethiopian Story*, with its beginning *in medias res*, was imitated in the literary Byzantine romances of Theodore Prodromos and Niketas Evgenianos, who also took over details of theme and incident. The *Ethiopian Story* was hugely influential in western Europe after the publication of the *editio princeps* in 1534 and Amyot's French translation in 1547, but much less so in Greece. However, in 1804 Adamantios Korais published a groundbreaking edition with modern Greek commentary, in the introduction to which he claimed the modern novel as a Greek invention.

Biography

Born at Emesa in Syria and probably writing in the 4th century AD, Heliodorus was the author of the *Ethiopian Story*, last of the surviving ancient Greek novels. According to the 5th-century historian Socrates, he later became a Christian bishop. This has been doubted, but the story no doubt ensured the survival of the text.

Hellenes

Ethnonym for ancient and modern Greeks

Although the Greek language was already employed by the time of the Linear B tablets of the 13th century BC, the term “Hellenes” is so far unattested for the Mycenaean period. Thucydides (1. 3) notes that in the Homeric poems the Greeks who participate in the expedition to Troy are denoted variously as Argives, Achaeans, and Danaans rather than described collectively as Hellenes – a term which is only applied to the Phthian contingent led by Achilles; on these grounds the historian hypothesizes that the name originally denoted a small tribe in Phthia (southeast Thessaly) before being disseminated more widely to describe all the populations of Greece. Aristotle (*Meteorologica*, 1. 14. 352a), on the other hand, derives the name “Hellenes” from the Selloi who were thought to have lived in the Epirote region of Dodona in northwest Greece, while a fragment of a 6th-century poem, erroneously ascribed in antiquity to Hesiod, describes Dodona as lying within the country of Hellopia.

A strictly empirical analysis of the occurrence of the terms “Hellas” and “Hellenes” in the extant literature of the Archaic period has prompted many scholars to accept the Thucydidean interpretation regarding the diffusion of the name, though with some modifications. In the *Iliad* Hellas is envisioned as adjacent though not identical to Phthia (2. 683; 9. 478) while the Panhellenes seem to have included the Locrians to the immediate south of Phthia (2. 530). The term “Hellenes” is not attested in the *Odyssey*, but on several occasions Hellas is opposed to Argos in contexts which should suggest that the former designated mainland Greece north of the Corinthian isthmus

while the latter indicated the Peloponnese (1. 344; 4. 76, 816; 15. 80). Similarly, in Hesiod's *Works and Days* (early 7th century), the terms "Hellas" and "Panhellenes" appear to be limited to central and northern Greece (528, 651–53). It is sometimes assumed that the vehicle of diffusion for the name was the Delphic Amphictiony – a league of (largely) central Greek states and tribal federations charged with the administration of the Delphic sanctuary – though the early historical existence of the Amphictiony and its struggles with the Delphians are controversial.

By the mid-7th century the term "Panhellenes" appears to be applied to all the populations of the Greek mainland and islands: the Parian Archilochus (fr. 97) refers to the Panhellenic colonization of the island of Thasos in which he took part, while a pseudo-Hesiodic fragment (fr. 130) employs the term to describe the various Greek suitors who sought the hands of the daughters of Proetus. In this period it was almost certainly the sanctuary of Olympia and in particular the Olympic games that acted as the focus of Hellenic identity. Herodotus (5. 22. 1–2) describes, in the context of Alexander I of Macedon's attempts to compete in the games in the early 5th century, how the contest was restricted to Hellenes alone and that competitors' qualifications were judged by officials named the Hellanodikai (whose existence is already attested in an early 6th-century inscription). In the mid-6th century the Ionian cities of Chios, Teos, Phocaea, and Clazomenae teamed up with the Dorian cities of Rhodes, Cnidus, Halicarnassus, and Phaselis and with Aeolian Mytilene to found the Hellenion sanctuary at Naucratis (Herodotus, 2. 178. 2).

It would appear that in the Archaic period the Hellenes conceived of their common identity in ethnic terms (that is, in terms of kinship between their constituent subgroups): the 6th-century *Catalogue of Women* (frs. 9, 10a) expressed this affiliation in genealogical form by deriving the descent of Aeolus, Dorus, Ion, and Achaeus (the eponymous ancestors of the Aeolians, Dorians, Ionians, and Achaeans respectively) from the eponymous Hellen. Nevertheless, in the Persian invasion of 480 BC the Greeks of the mainland were confronted for the first time by an external enemy whose language, customs, and religion appeared so desperately alien that it instigated the rhetorical construction of a barbarian "other" in opposition to which the Greeks began to define themselves. A similar polarization seems to have occurred at the same time among the Greek colonies of south Italy and Sicily where confrontation with the Phoenicians of Carthage prompted the colonists to promote their common Hellenic identity above the Dorian, Ionian, or Achaean affiliations to which they had previously subscribed.

Typical in this regard is the definition of Greekness (*Hellenikon*) which Herodotus (8. 144.2) places in the mouth of an Athenian envoy prior to the battle of Plataea (479 BC): the Hellenes are those who share common blood, a common tongue, common sanctuaries and sacrifices, and similar customs. In the early books of his *Histories* Herodotus presents a series of ethnographic excursions on the Persians, Egyptians, Libyans, and Scythians which serve to highlight the profound cultural differences between Greeks and barbarians and which reflect a growing conceptualization of Hellenic identity in cultural rather than ethnic terms – a definitional shift paralleled also by Sophistic and Hippocratic emphases on environmental rather than biological determinism. Both Herodotus and Thucydides imply that non-Greeks who learned the Greek language and Greek customs could “become” Hellenes and c.380 BC, the Athenian orator Isocrates proclaimed that the Hellenes were defined by their shared culture rather than their common nature (*Panegyricus*, 50). The word that Isocrates uses for “culture” is *paideusis* (cognate with *paideia*) which denotes a cultural system imparted through education, and throughout the 4th century there is a strong sense that Hellenism is a matter of the correct education – preferably at Athens, which Pericles had already described half a century earlier as “the school of Hellas” (Thucydides, 2. 41. 1). It was this common Hellenic culture that was thought to engender a sense of *homonoia* (unanimity) – a term frequently invoked in the 4th century BC as part of a Panhellenic rhetoric which aimed at uniting the various Greek city states in a common crusade against the Persian empire, purportedly in retribution for the Persian invasions of the early 5th century.

Though contemplated by both King Agesilaus of Sparta and Philip II of Macedon, this Panhellenic crusade was ultimately undertaken by Alexander the Great whose conquests in the East planted Macedonian-Greek garrisons among indigenous populations as well as disseminating elements of Greek culture throughout much of the known world. While it is perhaps inaccurate to say that the East was “Hellenized”, regular interactions and intermarriage between Greeks, Macedonians, and indigenes precluded any strict ethnic definition of the term “Hellenes” which was applied more on the basis of common cultural and behavioural traits transmitted through the traditional Greek *paideia*: so, for example, in documents from Ptolemaic and Roman Egypt Hellenes are regularly described as “those associated with the gymnasium”.

The Greeks continued to call themselves Hellenes under Roman occupation despite the fact that their conquerors divided them between the provinces of Macedonia, Achaea, and Creta et Cyrene (to say nothing of the Greeks in Asia Minor and the Hellespontine areas)

and referred to them as “Graeci” (itself a word of Greek derivation). A sense of a historical Hellenic identity was once again resurrected with the emperor Hadrian’s foundation in AD 131/32 of the Panhellenion – a league of cities to which admission was dependent upon the ability to adduce origins from the cities of old Greece – and writers of what is known as the Second Sophistic period reinvoked an archaizing identity predicated on the Classical Hellenic past. In general, however, the term “Hellenes” retained its linguistic and cultural rather than ethnic connotations, with the Atticizing dialect considered the purest form of the Greek language.

With the spread of Christianity “Hellenes” increasingly came to designate pagans – particularly in the writings of the Church Fathers – and continuity with the Hellenic heritage was consciously ruptured through the rejection of naturalistic sculpted representations of the human form, the rectilinear architectural plan of the Hellenic temple, Hellenic philosophy (or at least some elements of it), and most importantly Hellenic religion. The equation between Hellenism and paganism was, if anything, strengthened in the 4th century AD by the apostasy and promotion of “Hellenic liturgy” on the part of the emperor Julian, and even as late as the 12th century AD the Hellenes are described as possessing a wisdom at odds with the real knowledge to be gained through the Christian religion (Anna Komnene, 2. 34. 12). Most Greeks of the Byzantine period referred to themselves as “Romaioi” (indicating their affiliation to the Christianized eastern Roman empire), though the 12th-century historian Niketas Choniates equated “Romaioi” with “Hellenes” (496. 50) and this double nomenclature became more common during the 13th century in the face of increasing threats from Franks, Venetians, and Turks, as well as with the gradual contraction of the Byzantine empire to include mainly Greek-speaking areas.

Hellenistic Period 323–31 BC

The Hellenistic age begins with Alexander the Great's conquest of the Persian empire and its incorporation into his vast, Macedonian-controlled state. It ends in more piecemeal fashion with the Roman conquest, one by one, of the various regions, now separate kingdoms, into which his empire had divided after his death, ending with the defeat of Cleopatra VII at the battle of Actium in 31 BC, and her suicide in her palace at Alexandria the following year. Its beginning is marked by a massive change in the fortunes and status of the Greek communities. The end is less marked, since in many ways the Roman empire developed out of the Hellenistic world, and in its system of administration was much influenced by it. There were, however, changes in geographical extent. Only the most powerful of kings could hold intact an empire as vast as Alexander's, and on his premature death in 323 BC, leaving only a halfwit and an unborn infant as his legitimate heirs, the empire had disintegrated into separate kingdoms, each controlled by a new dynasty descended from the Macedonian warlord who had originally seized control of it. It took a Roman emperor to reunite it, and by that time much, in Mesopotamia and further east, had been lost to the Hellenistic world.

Thus the Hellenistic world was never a political unity, though all its constituent parts, and their various rulers, looked back to Alexander as the ultimate source of their existence. Behind this there were often considerable local variations, since it included regions with non-Greek forms of civilization much older than that of the Greek world itself. At the same time, the conversion of all this into Hellenistic shape (the term itself is a 19th-century invention, but accepts the fact of the extension into this wider area of a culture that was essentially Hellenic in origin, in a world that thus became Hellenized) was not merely a matter of military conquest. The defeat of the Persian invader by the Greeks in 480/79 BC, long before the counter-crusade promoted by Philip II and executed by Alexander, had given the Greeks – with their political systems that valued independence, and above all with the military skills of their citizen foot soldier that resulted from this – a prestige that was acknowledged by their non-Greek neighbours, and already used by them for their own purposes.

Thus Hellenization was also a state of mind created within the non-Greek. It can be seen clearly at Phoenician Sidon, where the kings (previously influenced by Egyptian customs and form) took over the manners of the Greeks and even, in the case of Strato, Hellenized their names. Greekness was attractive in its own right, not merely through virtue of Macedonian military success, and despite the fact that many so-called Macedonians in the armies of the Hellenistic kings, following a policy of necessity already instituted by Alexander himself, were not true Macedonians by origin.

As a period, the Hellenistic age has been looked down on as an inferior descendant of its Classical predecessor. Much of the intellectual and artistic excitement seems to have gone. In the Classical tradition of western European education, based on the study of the great authors of the 5th and 4th centuries BC or earlier, the writings of the Hellenistic authors were regarded as markedly inferior in style and content alike. They were neglected, particularly in the late Roman and Byzantine schools, which were more concerned with what seemed to be the purer forms of the earlier texts. Much Hellenistic poetry, and the bulk of the work of the greatest Hellenistic historian, Polybius, was lost when the manuscripts ceased to be copied in this period. In many ways, judging from what has survived, this is understandable.

Thus the Hellenistic age has suffered from a degree of neglect. Yet it is of crucial importance, a vital link in the continuity of the Greek tradition. If it had not existed, or the continuity had been broken, our understanding and appreciation of Greek civilization would have been weakened irrevocably. The Hellenistic states took the Greek tradition, modified it, and moulded it in many ways to suit the different circumstances of what was still, reckoned in terms of the vast majority of its inhabitants, a non-Greek world, and then handed it on to their equally non-Greek but equally infatuated successors, the Romans. The Greek world transmitted through the Roman empire, it must always be remembered, was the Hellenistic world, not that of the Classical city states.

The achievements of the Hellenistic world are found in different subjects; they often depend on local or regional rather than universal circumstances. Foremost is the Museum – that is, the sanctuary of the Muses – at Alexandria, and its library. This was essentially the creation of royal patronage by the Ptolemies, the dynasty that seized Egypt as a largely self-contained area suitable for an independent kingdom in the struggles of Alexander's successors. Alexandria, which was officially “next to” rather than “in” Egypt, emphasizing its non-native character in an essentially alien land, became the capital, a substantial part of its area designated as royal, containing, in addition

to the actual palace residence of the kings, the tombs of Alexander himself and the Ptolemies, as well as shrines and sanctuaries including the Museum. In addition to the actual cult of the Muses, the Museum provided a residence and place of study for scholars who were deliberately attracted to the city and paid a salary from royal resources. This royal patronage of the arts and learning, though it echoes that of the age of the tyrants, is very different from the system that prevailed in the Greek city states. The direct antecedent for it is rather Macedon under Archelaus, and later Philip II and Alexander. The intellectuals brought to Alexandria included poets, such as Callimachus and Theocritus, who often had other functions, as tutor to the royal children, or librarian. Though Alexandria was originally intended as a city for those people of Greek origin who had already settled in Egypt when it was conquered by Alexander, it expanded rapidly through an influx of new settlers from the Greek world and elsewhere, particularly in the time of Ptolemy II. It is noticeable that the intellectuals of the Museum, when we can trace their origins, invariably came from other parts of the Greek world (Callimachus from Cyrene, Theocritus from Syracuse).

Most members of the Museum were scholars rather than creative artists, and though Alexandria is only one particular and untypical part of the Hellenistic world, it is this aspect that sets a pattern for Hellenistic achievement. The library was not merely a great storehouse of all known Greek literary texts – which the early Ptolemies collected avidly, buying up, for example, the official copies of the texts of Athenian drama, part of that city's state archive – it was also a place where the texts were studied, where necessary codified, and copies manufactured, using the readily available Egyptian papyrus. It was at Alexandria that the definitive text of Homer was established, the two great poems divided into 24 “books”, and handed on to posterity. It is through Alexandria that the Classical and earlier texts survived. The commentaries and annotations on them, though generally Byzantine in their surviving form, incorporate and continue the work of Alexandrian scholars.

Even so, the area of greatest strength was in the sciences. The Macedonian kings had a personal interest, and often involvement, in practical engineering, specifically for military purposes, and this continued to be developed in the Hellenistic age, not merely at Alexandria. In other sciences, including astronomy, mathematics, and medicine, scholars based in Alexandria continued work on subjects whose study had originated elsewhere; what was different now was the far greater opportunities available. When Eratosthenes, the polymath from Cyrene, wanted to calculate the size of the earth, he was able to do so – it appears, accurately – by measuring the different

angle of shadow cast by the midday sun at Alexandria during the equinox, compared with the overhead sun at Syene (Aswan) which was virtually on the tropic. The distance between the two places was known, and both were of course situated within the kingdom of the Ptolemies. Medicine, too, was briefly in an outstandingly favourable position. Careful (that is, scientific) observation of symptoms, cures, and the progress of diseases had certainly been established by the 5th century BC, by Hippocrates of Cos, and the medical school founded on that island at that time continued to flourish. Doctors trained there and elsewhere were attracted to Alexandria, and one of them, Herophilus, made startling advances in the understanding of the nervous system and optics in particular. The advantage he had was that Ptolemy made available to him the corpses of executed criminals for dissection and even, it is plausibly believed, live criminals for vivisection, forms of research that were unthinkable under the ethics of traditional Greece. Mathematics continued to be hampered by the lack of a simple numerical system; or rather, it transcended this by complex work in geometry, particularly the study of conic sections by Apollonius of Perge, who in his turn had been attracted to Alexandria.

Much of this achievement is difficult to evaluate. Very often the treatises written by these scientists have been lost. Some (particularly, it seems, in medicine) were superseded by later treatises written by those who continued the work in Roman times. Others, particularly where no further advances were made, ceased to be studied and so copied in later times; the Greek was difficult to understand, did not have any literary value, and was of little interest at Constantinople. Yet some of the most important works certainly survived at Alexandria into medieval times, and, if not copied, were translated into Arabic. Thus the Hellenistic tradition continued, not at Constantinople but at Baghdad. It is important to remember this as an instance of the continued survival of the Hellenic tradition in an area that lies outside the world of European civilization.

Alexandria was not the only place where scholars worked. Athens was associated rather with the continuing schools of philosophy, the Academy of Plato and the Lyceum of Aristotle and their successors. This made Athens, rather than Alexandria, the goal of other philosophers, such as the Phoenician Zeno of Citium in Cyprus, who taught in the Painted Stoa of the Agora at Athens, and so instituted the Stoic philosophy; and Epicurus, born on Samos of Athenian parents, whose philosophical school was established in the garden of the house at Athens where he settled towards the end of the 4th century BC. Both these schools of philosophy continued to be of major importance in Roman intellectual life. Pergamum, on the other hand, which became a Hellenistic capital city under its upstart dynasty the

Attalids, was developed to emulate Alexandria, particularly in the 2nd century BC when Alexandrian intellectualism seems to have gone into a decline in the face of a lack of interest among the later Ptolemies, culminating in an expulsion of the scholars in 146 BC.

Yet in many ways the greatest importance of Hellenistic civilization lies in the interrelationship of the different cultures, Greek and non-Greek. Throughout, the Greeks maintained a supremacy that was only gradually weakened in the face of military decline. Generally, under their Hellenistic kings they enjoyed a superior position within the community and its political system, and though in the late period vast areas in the east were lost to resurgent oriental states, at the very end the Greeks were able to maintain their social supremacy (at least) through the intervention of the Romans and the takeover of the kingdoms and cities into the Roman empire. Greekness, therefore, was something desirable and to be aimed at, and there was clearly much assimilation into the Greek community by non-Greeks. Important Hellenistic Greek poets, such as Meleager, were of non-Greek origin. In the 1st century AD Juvenal, bemoaning the influence of the Greeks in Rome, has to point out that the corrupting influence comes not from true Greeks but that already, for a long time, it is the Syrian Orontes that has flowed into the Tiber.

The impact of all this can be seen in different ways. The socially superior Greeks lived in cities to which the kings often devoted great expenditure, on architecture or, at times, “shows” of various categories. Architecturally, the Hellenistic cities acquired a magnificence and solidity never found even in the greatest of their Classical predecessors, and this taste for magnificent urbanism was continued and developed by the Romans. Alexandria was a city on an altogether vaster scale, the spaciousness of the royal area contrasting with the densely built tenement blocks of the ordinary inhabitants, a contrast also found at Rome. But perhaps the most significant impact comes within the sphere of religion, expressed through the medium of the common Greek language (Koine) which became a universal second language even among the non-Greeks. Greek religion had been essentially tied to its localities. Greeks uprooted from home in the new Hellenistic settlements began to look to the local religions as apposite to the areas in which they now lived. Sometimes this was deliberately fostered by the kings (Serapis at Alexandria), but more often it was a spontaneous development. It was the Hellenized world that spread the Egyptian Isis cult through the Greek and Roman communities, or the oriental Mithraism taken up by the Roman army. Christianity is an offshoot of the Jewish religion, though its sacred books are in the koine. Even so, it might have remained yet another obscure Jewish sect, had St Paul not seen the light outside the walls of Damascus, and

promoted his beliefs in the Greek world; his epistles are a roll-call of the Hellenistic communities. Without the Hellenistic world, the world of Christian Greece would never have existed.

Hellenization

Hellenization denotes the spread of Hellenic culture in non-Greek, “barbarian” society and the process under which “barbarians” accept, adopt, and incorporate Hellenic culture. The term is closely connected with the Hellenistic period, which runs from the death of Alexander the Great in 323 BC to the death of Cleopatra, queen of Egypt, in 30 BC. Its earliest phase is marked by Alexander’s successful invasion of the Persian empire; its termination by the repartition of the Near and Middle East between Rome and the new, Persian-ruled kingdom of Parthia. For much of the intervening three centuries the territory of the former Persian empire was dominated by a series of Macedonian-ruled states wherein Greeks and Greek culture enjoyed a pre-eminent

position. Greek scientists formulated ideas and theories that would remain fundamental in a variety of fields until the Renaissance; art and literature flourished; and the foundations of western literary scholarship were laid.

The first modern appearance of the concept of Hellenism and Hellenization occurs in *Geschichte des Hellenismus*, G. Droysen's great three-volume work published between 1833 and 1843. He viewed the Hellenistic period as the time in which, in the territories conquered by Alexander the Great, Greek and Near Eastern cultures were intertwined to create the cultural background from which Christianity emerged. Archaeological excavation also played an important role in the formulation of the concept of Hellenism. The discovery in Europe and Asia of Greek sites of the Hellenistic period has provided information on the physical setting and material culture of the population of these new Macedonian kingdoms and their neighbours; and continues to do so. Archaeology has yielded a wealth of new written evidence – in the form of papyri and inscriptions on stone – which gives scholars a detailed view of the government and society of a major state, Ptolemaic Egypt. The creation in the 19th and 20th centuries of modern European empires in regions once dominated by the Hellenistic kingdoms was a further spur to reassessing the Hellenistic period. These developments encouraged scholars to see Alexander and his Macedonian successors as precursors of contemporary events. In parallel, scholarship was adding new evidence to Droysen's view of Hellenistic civilization as a mixed culture which, although Greek in character, had been enriched by the incorporation of features derived from ancient Near Eastern cultures.

Is Hellenization a term that reflects the reality of an ancient society, or a term and concept created by modern scholars in the course of their studies? Is it a tool, useful shorthand, or a phantom? According to G. Bowersock, "Hellenization is ... a modern idea, reflecting modern forms of cultural domination."

The term "to Hellenize" is first encountered in Thucydides (2. 68), where it is used in not a political but a linguistic context. The acceptance and use of the Greek language by non-Greek societies is known from periods other than the Hellenistic. For example, in the Persian empire of the 5th and 4th centuries BC, whose outlook was anti-Greek, the Greek language was adopted by the Lycian dynasts Pericles of Limyra and Mausolus. At the same time Mausolus avoided the Panhellenic sanctuaries, preferring the local Carian shrines, and denied proxeny (diplomatic representation) to the citizens of Knossos. Greek craftsmen were used widely by local rulers in Anatolia and around the Black Sea to create royal and elite culture long before the Hellenistic period, as is witnessed in the Achaemenid empire or the

Thracian kingdom. But this can hardly be described as Hellenization, in which the local melds with and into the Greek. The ideology and everyday life of local rulers remained resolutely untouched; the Greek element extended little beyond a veneer of sophistication, a series of external, material attributes.

In the wake of Alexander the Great's conquests, Greeks moved to the east to populate new regions and establish new cities. Alexandria, Antioch, and other cities were founded. In the Hellenistic period Alexandria, with its library etc., can better be considered the centre of Hellenic culture than mainland Greece; Ai Khanum, Alexandria on the Oxus in northern Afghanistan, with its broad streets, monumental temples, large gymnasium, and theatre, was much more impressive than Athens. Heraclides Creticus warned those travelling from the east not to be disappointed by their first impressions of Athens and other famous cities in metropolitan Greece – the rather run-down houses, the old-fashioned streets, etc. Hellenistic historians themselves considered the new cities in Asia Minor to be melting pots in which Greek and non-Greek cultures and peoples met, mingled, and created a new cosmopolitan civilization.

Greek culture was dominant from the Mediterranean to the borders of India. Everywhere Greek was the language of government. The traditions of Archaic and Classical Greek culture were admired and followed, but not blindly; new features taken from local cultures were introduced. For example, the reliefs on the great altar at Pergamum may seem at first alien to the tranquillity associated with Classical sculpture; in fact, they resemble the sculpture on the pediment of the Parthenon. In the Hellenistic world culture was uniform only on the surface. There were differences between the culture of Aegean Greece and that of the new kingdoms of Asia and Egypt. In the former, writers and artists adhered strictly to centuries of tradition: local dialects and traditional cults and festivals flourished. From a cultural perspective an old Greece of tradition can be identified in the Hellenistic period and beyond; but in the east there was a “new Greece” which admired traditions but was not constrained by them, adding new elements and concepts absorbed from local societies, their practices and cultures. This appears to be more a case of orientalization than Hellenization, a case different from that in Greece at the beginning of the 1st millennium BC. The terminology deployed by modern academics usually fails to penetrate the intrinsic nature of the historical or cultural events in antiquity that it is used to describe. This is as true of the term “orientalization” as it is of “Hellenization”. What is being described in both cases is the spread and intermixing of different cultures. In the Hellenistic period different ethnic groups absorbed Hellenic culture and transmitted aspects of their own culture

to Greeks. This was a side effect of political developments. If a label has to be attached to this, then “cosmopolitanization” would be more appropriate than either “orientalization” or “Hellenization”.

In the Hellenistic period in Greece the polis changed under social and economic pressure. Its political life narrowed and became harsher. New studies suggest that in the Seleucid empire the structure of the polis was less strong than traditionalists seek to depict. There was a continuity with Achaemenid Persian and Babylonian structures. The effects on Jewish culture of Hellenization on the one hand and Seleucid influence on the other remain unclear and disputed.

The Greek polis with its culture survived into the Roman period, and the Romans consolidated their rule in the east through the introduction of the polis. Evidence shows that in the Roman period the only significantly Hellenized part of the population was the elite. Roman culture itself was heavily influenced by the Greek, copying Greek sculpture, for example, and worshipping the same gods though under Roman names. Written Greek was in active use along with Latin and Aramaic. The Byzantine empire inherited not only the Greek language; Christian epigrammatists echo the idioms of their pagan predecessors.

Heraclitus *fl.* c.500_{BC}

Philosopher

A citizen of Ephesus, Heraclitus was the first philosopher to approach the study of nature from the standpoint of the human condition. Writing riddling sayings in a dense aphoristic style, which have survived as quotations in later writers, he criticized poets, philosophers, and ordinary people for their failure to see the meaning inherent in the world. There is an order in nature, a *logos* (governing principle), that is always present, but which men miss both when they experience it and when they are told the truth about it, for they move through the world like sleepwalkers. Study of the facts will not teach understanding; what is needed is an understanding of how things fit together. What the *logos* teaches is that all things are one.

Heraclitus inherited from earlier philosophers the view that some one kind of stuff is changed by transformation into all other kinds of stuff. Whereas Thales had said that everything comes from water and Anaximenes that everything comes from air, Heraclitus held that everything comes from fire. Fire turns into water and half of the water generated turns into earth and the other half back into fire, preserving the same proportions of matter through the changes (fr. 31). Unlike his predecessors, who believed that the world came to be from unstructured matter, Heraclitus states that the world order “always was and is and will be everliving fire, kindling by measures and going out by measures” (fr. 30). It is the kindling and quenching of fire that preserves the world. By identifying fire, the most changeable reality, as the basic substance of the universe, Heraclitus seems to be stressing changeability. “Onto those stepping into the same rivers other and other waters flow” (fr. 12): the changing waters constitute the river. Thus change underlies and makes possible the structure of the world and the things in it.

According to Heraclitus, opposites are somehow one: the living and the dead, the waking and the sleeping, the young and the old are the same because they change into one another (fr. 88). The opposing

tensions of the bow and the lyre make them work. Day and night are one. “The road up and the road down are one and the same” (fr. 60). What seems to make all things one is their interconnectedness in the series of transformations: there is one road with two-way traffic, one process with two-way changes going on. In the changes of fire there is a constant equivalence of material, something like a conservation of matter, which Heraclitus compares to the exchange of gold for goods and goods for gold (fr. 90). The value of the goods remains constant even though the items exchanged vary. The ultimate reality, then, is not any substance that travels the road, but the process of change itself, the law of transformations symbolized by fire. Overall, Heraclitus seems to have started with a picture of the world much like that of his predecessors, but he moved far beyond them in finding the source of unity in the world not in a single original substance such as water or air, but in a unified order of change. His predecessor Anaximander had seen cyclical changes such as day and night, summer and winter, as embodying acts of strife between opposites to be corrected by a cosmic principle of justice. Heraclitus replies that justice *is* strife, for opposition holds the world together.

Souls arise from the moist and they perish if they return to moisture. It is best for the soul to be fiery, and better souls receive a better lot after death. “Moderation is the greatest virtue and wisdom, to speak and act truly, perceiving according to their nature” (fr. 112). People should rely upon and defend their laws, but above all the one divine law by which all human laws are “nourished”, presumably the *logos* (fr. 114). Human nature, then, mirrors nature as a whole, and human society is ultimately governed by the same laws as the cosmos.

In the 4th century BC Plato attributed to Heraclitus the claim that “you can’t step into the same river twice” (Cratylus, 402a). The claim, which seems to be an interpretation of fragment 12 (quoted above) – perhaps one Plato got from Cratylus, a Heraclitean – suggests that for Heraclitus nothing stays the same. Plato’s own philosophy was heavily influenced by the flux theory he attributed to Heraclitus: he held that the world of sensible objects was always changing. Plato and Aristotle also attributed to Heraclitus the view that opposites are identical (not just the same by virtue of being stages in a single process), which led them to say that he accepted contradictions. Henceforth Heraclitus became known in the doxographical tradition as a philosopher of flux who embraced contradiction and hence had an incoherent philosophy.

In the 3rd century BC the Stoics revived the view that all things come from fire, and also attributed to Heraclitus their view that there are periods of world-conflagration in which all substances turn back into fire, after which the world is regenerated from fire. In the early Christian era intellectuals sometimes saw Heraclitus as a proto-

Christian because of his ethical views, his emphasis on *logos*, and his belief (on the Stoic interpretation) in a fiery judgement on the world.

DANIEL W. GRAHAM

Biography

Born in Ephesus to an aristocratic family, and active c.500 BC, Heraclitus identified fire as the basic substance of the universe. He also posited an order (*logos*) in nature. Only fragments of his writings survive.

Herodas

Poet of the 3rd century BC

So little is known about Herodas (or Herondas, as he is sometimes called) from sources besides his own poems that neither when nor where he lived and wrote can be determined with any certainty. Various chronological hints in his first, second, and fourth poems point to composition dates in the 270s and early 260s BC. If the settings

of his second poem (the island of Cos) and of his sixth and seventh poems (probably in Asia Minor) may be connected with the dwelling-place(s) of the poet himself, Herodas probably spent some periods of his life in parts of the eastern Aegean. His first poem exhibits a certain amount of knowledge and praise of Ptolemaic Egypt, but this does not necessarily indicate that Herodas lived there for some time as well (if he did, he is most likely to have lived in Alexandria).

It was through the fortunate discovery of a papyrus (British library Pap. 135, first published in 1891) that scholars gained knowledge of substantial parts of the poems of this early Hellenistic author, which exhibit many features typical of Greek poetry of that age. Seven of Herodas' poems are readable in a more or less complete form (the much more fragmentary nos. 8 and 9 are largely unintelligible); their length ranges from 85 to 129 verses, and they are collectively called *mimiamb*s, an appropriate title for their composite nature, as on the one hand their content has much in common with the form of low-level popular drama called *mime*, while on the other their metrical form and language are taken from *iambus*, an archaic form of very personal and often invective Greek poetry whose main proponents were Archilochus and Hipponax. *Mimes*, too, had already existed for hundreds of years before Herodas and continued to do so until (at least) the end of antiquity; they depicted scenes of everyday life (with frequent and rather explicit inclusion of sexual themes and situations) and down-to-earth or even vulgar characters, and they were performed – depending on their length and plot – either by a single person or by a small troupe of itinerant actors; their texts were mainly in prose, and their language usually in the local dialect (Doric in Sicily and southern Italy, for example). By combining *mimic* content with the form of ancient *iambus*, Herodas gave his poems a rather rigid form. His main model being Hipponax of Ephesus (to whom he refers at the end of his eighth poem, though the badly mutilated text does not allow us to glimpse specifics), he took over Hipponax's Ionic dialect and his peculiar metre, the so-called *choliambos*, or limping iambic, in which the penultimate syllable – which would normally be short – is long; this introduces a rhythmical disturbance which noticeably increases the sense of mocking and ridicule of the poems' content. Even within these rigid formal boundaries the scenes and situations depicted by Herodas at first sight seem completely natural, which is a great compliment to the poet's mastery of his art.

A brief examination of the poems' content gives an idea of their characteristic features and their connections with older and contemporary literature. Remarkably often women are the main characters. In the first *mimiamb* ("The Matchmaker or Procuress") a woman living alone (her companion has gone to Egypt) is visited by

the title-figure, who tries to arouse her interest in another man, but is told in rather plain terms that this is out of the question. The second ("The Brothel Keeper") is a plea spoken by the title-figure before a jury: the brothel keeper (a figure familiar from Greek comedy) accuses a foreign ship's captain of attacking his establishment in order to capture a girl, and he tries to project the image of an honest, law-abiding resident, but the poet lets the meaner sides of his character (most of all greed) peep through his words. In the third ("The Schoolmaster") an angry mother drags her wayward son to his schoolmaster and asks him to give the naughty boy a good beating to set him on the right track again; the son, by feigning repentance, avoids the thrashing. The fourth ("The Women who Offer Thanks and Sacrifice to Asclepius") shows two women offering a cock to Asclepius (for curing an illness) and admiring the artworks in the god's temple precinct; Herodas' contemporary Theocritus treated a similar subject in his fifteenth *Idyll*. The fifth *mimiamb* ("The Jealous One") depicts the most mimic theme of all these poems, adultery (a mime preserved on another papyrus fragment, P.Oxy. 413 verso, shows many similarities). A mistress accuses her slave, whom she uses as a sexual partner, of having bestowed his favours on another woman as well and gives orders for him to be flogged and tattooed; finally, though, she accedes to a plea for mercy uttered by another (female) slave who is dear to her. In the sixth *mimiamb* ("The Women who are Friends [or In Private]") a lady (Metro) visits her female friend (Koritto) and eagerly inquires who the crafty cobbler is who provided her with that most wonderful dildo which she has recently seen with another friend of Koritto's; Koritto is somewhat annoyed that her delightful secret is already going round, but then proceeds to reveal the cobbler's name, Kerdon, whom Metro then rushes out to find. Metro and Kerdon (now a speaking part himself) appear again in the seventh *mimiamb* ("The Cobbler"), where Kerdon tries his sales pitch in front of some women whom Metro has brought into his shop, and there ensues some very amusing haggling about shoes and prices (and some hinting at other leatherware as well...). In the badly mutilated eighth *mimiamb* ("The Dream") the poet himself apparently speaks, relating a dream in which he takes part in a Dionysiac festival and competition; at the end he remarks on his relationship to Hipponax. Of the ninth ("The Breakfasting Women") only fragments of the first 13 lines survive and give no clear idea of the poem's narrative. Scholars disagree as to how these amusing pieces were presented to their contemporary audiences: by one reciter (Herodas himself?) alone or by several actors playing the various roles (ranging from two to four in the single poems)? Their very restricted length (see above) rather points to the former as most likely.

Only very few fragments of two, three, or four other poems by Herodas appear as citations in other literature, but they are very few and their meagreness shows that Herodas was not a much-studied author after Hellenistic times. He was still read, though, in Egypt in the 2nd century AD, as two papyri (Brit. Lib. Pap. 135, mentioned above, and the slightly later P.Oxy. 2326) demonstrate. Ironically, it is not a Greek, but a Roman, Pliny the Younger, who paid Herodas the biggest compliment by putting him on the same level as Callimachus in a letter to a friend (4. 3. 3). Soon after, Herodas almost completely vanished from the literary consciousness of antiquity, only to be reborn from the sands of Egypt at the end of the 19th century.

Biography

The date and place of his birth are unknown, but Herodas (or Herondas) seems to have flourished in the 270s and 260s BC, and may have lived some of the time in the eastern Aegean. He wrote “mimiamb” depicting scenes of everyday life. Seven poems survive largely intact, and fragments of others.

Herodes Atticus c.^{AD} 101/03–177

Sophist and patron

The Athenian Herodes Atticus was the most striking example in his time of the native Greek who, although highly successful within the political system of imperial Rome and perfectly integrated into upper-class Roman society, nevertheless remained entirely Greek in his cultural orientation. His full name was Lucius Vibullius Hipparchus Tiberius Claudius Atticus Herodes, and he was the son of a very rich Athenian, Tiberius Claudius Atticus Herodes, and of Vibullia Alcia, a niece of her husband. Like his son after him, the father succeeded in penetrating the highest levels of Roman administration. He was the first Greek from old Greece to reach the suffect consulship, around ^{AD} 132, and probably also its first member of the Roman Senate.

Already in his education Herodes combined Greek and Roman elements. In Greek he followed the normal upper-class curriculum of his day. He studied literature with Theagenes of Cnidus and Munatius of Tralles. In rhetoric he ordered among his teachers the Athenian Secundus as well as some of the most famous sophists of his day, Scopelian, Polemo, and the Celtic polymath Favorinus. He rounded out his education with a course in Platonic philosophy under the renowned Calvenus Taurus.

He was, however, also educated in a Roman milieu, in the family of P. Calvisius Tullus Ruso, *consul ordinarius* in ^{AD} 109 and the grandfather of the future Roman emperor Marcus Aurelius. This sojourn led not only to a familiarity with upper-class Roman society but, presumably, also to his acquiring a perfect and accent-free Latin, a valuable and uncommon asset for a Greek.

As might be expected from a son of the rich and prominent Atticus, Herodes ascended to high office in Athens. Already in his early twenties he became an *agoranomos*, a supervisor of the market; soon after, in ^{AD} 126–27, he held the prestigious post of the eponymous archon, a post that not even Hellenistic kings and Roman emperors had disdained. As an ex-archon he also became a life member of the illustrious council of Areopagus.

After his archonship at Athens, Herodes began his Roman political career. Although not clearly attested, his first office must have been one associated with the vigintivirate, possibly that of a *quinquevir litibus iudicandis*. Next, he was honoured by the emperor by being chosen as *quaestor principis*. After his tribuneship and praetorship he was appointed as a *corrector* of the province of Asia for ^{AD} 134–35. His career reached its culmination in ^{AD} 143 when, as the first Greek from old Greece, he became a *consul ordinarius*, just as his father Atticus had been the first suffect consul. Herodes was subsequently offered

the chance of a proconsulship or, possibly, of a second consulship but he turned down this offer.

In addition to his political posts Herodes was also honoured with other offices of great social prestige. He was chosen to be the *agonothetes* (exhibitor) of the Panathenaic games and of the Panhellenia. He was also the *archiereus ton sebaston* (high priest of the Augusti) and the priest of the *Tobacchoi*, as well as a *sodalis Augustalis* and a *sodalis Hadrianalis*.

Herodes was also possibly the most generous private philanthropist of the Roman empire. His greatest Athenian building projects were the Panathenaic stadium, clad in white marble, and the Odeum, roofed with costly cedar. He also built a roofed theatre at Corinth and rebuilt and enlarged the stadium at Delphi. Another of his major structures was the aqueduct at Olympia to supply drinking water for the spectators at the Olympic Games. Numerous less expensive benefactions are also attested. Herodes dreamed of crowning his benefactions with an even mightier accomplishment, the building of a canal across the isthmus of Corinth, a project attempted but not completed by the emperor Nero. He did not, however, muster the courage to ask the emperor for permission.

Although famous for his philanthropy and very successful in public life, Herodes was probably best known at large as the leading figure in the Greek-language cultural movement known as the Second Sophistic. He was the acknowledged master among his fellow sophists, to wit performers and teachers of display oratory. Their show declamations were perhaps the most popular form of Greek-language artistic entertainment from the second half of the 1st century AD to the first half of the 3rd. In these performances a sophist was often expected to deliver a speech, usually on a topic of Classical Greek history proposed by the audience, with only a brief period of time allowed for preparation. Much was expected of these performers by their knowledgeable audiences. Their grasp of Greek history had to be accurate, and they were also required to be Atticists, i.e. to use a Greek borrowed from Classical Greek writers, a Greek that in vocabulary, morphology, and syntax often departed from contemporary educated speech. Above all, they had to express their subject matter in striking and original diction. In addition, the successful declaimer had to act out convincingly, and in a euphonious voice, the historical character he was impersonating. It is noteworthy that despite his immersion in his Roman *cursus honorum* and his marriage into a patrician Roman family, Herodes entirely avoided cultural Romanization and by preference invested his artistic and intellectual energies in an art form not only entirely Greek in language, form, and content but even associated by some with anti-

Roman sentiments.

As a teacher, Herodes educated many of the prominent sophists of the next generation and was honoured by being chosen as the teacher of rhetoric of the future emperors Marcus Aurelius and Lucius Verus.

The most lasting legacy of the Second Sophistic, hence of Herodes Atticus, its most resplendent representative, was to entrench among the educated the use of Koine, a common Greek that had reincorporated into itself many of the linguistic features of Classical Greek that had disappeared in oral and written usage during the Hellenistic and early Roman periods. Because this reprimed Greek was adopted by the state and by the educated in the Byzantine period, it enjoyed an existence of well over a thousand years.

Of the written works of Herodes nearly all have been lost. Philostratus, his biographer, writing in the 3rd century AD, reports as extant very many letters, speeches, and diaries, as well as handbooks and anthologies. Still extant is a speech called *Peri Politeias* (On the Constitution) attributed to Herodes by the Codex Crippsianus. It represents, perhaps, the ultimate triumph of Herodes as the perfect Atticizing sophist. The writer's knowledge of Greek history and his skill at avoiding non-Classical Greek are so remarkable that several modern scholars have deemed this speech to have been written by a Greek of the 5th or 4th century BC.

Herodes was less fortunate in his family life. He married Appia Annia Atilia Regilla Caucidia Tertulla, who came from a patrician Roman family with consuls on both her father's and her mother's side. In fact, her paternal and maternal grandfathers were joint *consules ordinarii* in AD 108. Although this marriage signified Herodes' acceptance as a member of the Roman aristocracy, his life as a husband and as a father was less than happy. Of his several children only the one he liked least, his son Bradua, probably the *consul ordinarius* of AD 185, survived him. When his wife Regilla died in premature labour, due, it was said by many, to a kick administered by one of her husband's freedmen, Herodes had to stand trial for murder on the charge of having ordered this assault. Although he was acquitted, the mere fact that so monstrous a charge could be readily believed implies a less than harmonious married life.

Herodes died at the age of 76, between AD 177 and 179, after a reconciliation with his fellow Athenians with whom he had had stormy relationships for most of his life. He received honorary burial in one of his most splendid gifts to Athens, the Panathenaic stadium.

There is no adequate biography of Herodes Atticus in English, though there is in German (Ameling) and an older one in French (Graindor). Philostratus's life of Herodes is translated in the Loeb edition (W.C. Wright), and is the subject of a detailed commentary by

the present author. Albini has produced an (Italian) edition of the speech *Peri Politeias*, though he is unconvinced that it is by Herodes as some scholars believe. Herodes' monumental remains are discussed most fully by Tobin.

IVARS AVOTINS

Biography

Born in Athens c.AD 101, Herodes was the son of a Roman senator and followed his father into a political career, becoming consul in AD 143. Educated by many of the best teachers of Greek and Roman culture, Herodes remained entirely Greek in his cultural outlook. He endowed many buildings in Greek cities and was a major representative of the Second Sophistic movement, though most of his works are lost. He died c.177.

Herodotus 484–c.425 BC

Historian

Herodotus' name is inseparable from that of his one surviving work, the *Histories*, an account of the Persian Wars (490–479 BC), fought between the Persian kings Darius and Xerxes and the cities of Greece and – very broadly defined – of the background to those wars. Though previous works, now surviving only in fragments, such as the *Genealogies* and *Journey round the Earth* of Hecataeus of Miletus, seem in some respects to have been similar in style and approach to the *Histories*, Herodotus has been recognized since antiquity as the “Father of History”.

Our knowledge of Herodotus' own life largely derives from the internal evidence of his work. He was born in Halicarnassus (modern Bodrum on the southwest coast of Turkey) at some point in the first half of the 5th century BC, but left as a consequence of a period of political infighting in which his family was involved. The extent of his travels is hotly disputed. Herodotus claims to have travelled to Egypt, the Levant, and the Black Sea, but some aspects of his accounts of foreign lands – his description of unknown (or his omission of well-known) monuments, his ascription of very Greek-sounding ideas to foreign sources, and a number of fanciful details – have led many to suppose that his knowledge of foreign lands was more second-hand, the product not of personal investigation but of Greek tradition (or, less plausibly, of his imagination). At the very least it seems certain that Herodotus spent time in Samos and in Athens, both cities on which he is well informed; he is reputed to have died in the recently founded Greek colony of Thurii in southern Italy, or in Macedonia. References in his work suggest that he wrote in the early years of the Peloponnesian War (431–404 BC): the tension between Athens and Sparta, the two chief protagonists of that war, is a regular undercurrent in his account of earlier events. Possible allusions to his *Histories* in the comedies of Aristophanes, most notably the *Acharnians* and *Birds*, suggest that the work may have been “published” in a number of instalments.

Herodotus' declared object was to record the “great and marvellous deeds of Greeks and Barbarians” and in particular “the reasons why they went to war with one another”. Only the last four of the nine books of his *Histories* describe the events of the Persian Wars; Herodotus' focus is much broader. His *Histories* are the chief source for the early history of Greece (from c.650 BC to the Persian Wars). At the

same time, while tracing the expansion of the Persian empire into Asia Minor, Europe, and Egypt, Herodotus takes the opportunity to describe the customs of all those peoples in the Persians' path. These accounts are written in the present tense, as if the characters of the different peoples were timeless. They cover religious customs, sexual practices, dress, language, hairstyles, and any other "wonderful but true" stories Herodotus thinks fit to include.

The structure of the *Histories* can at first be bewildering. As he declares at one point, it is his intention to "digress" from the main course of his narrative. One such digression – on the history and customs of Egypt – takes up the whole of the lengthy second book. Nevertheless, as recent work has demonstrated, there are a number of underlying patterns to the work that are not initially evident. The search of the Lydian king Croesus for a Greek ally with whom to counter the Persian Cyrus leads Herodotus in book 1 to investigate the relative strengths of Athens and Sparta: the two cities are repeatedly juxtaposed. The close of the *Histories* used to be thought impossibly inconclusive. A number of echoes of the opening of the work reveal, however, a very polished and final ending – albeit one without any of the explicit historical conclusions that modern readers are led to expect. The last main episode of the *Histories* concerns the execution, on a site overlooking the Hellespont, of a Persian commander, Artacytes, for plundering the shrine of the hero Protesilaus. Protesilaus had been the first Greek to cross to Asia, and to die there, in the course of the Trojan Wars. In Artacytes' view, however, Protesilaus had in turn plundered his wealth from the king of Persia; for the Persians, Herodotus explains – recalling a Persian explanation of the earlier hostilities between Asia and Europe at the opening of the *Histories* – believe all of Asia to belong to their king. At the same time, the barbaric manner of Artacytes' punishment – he was nailed to a plank, his son stoned to death before his eyes – points forward to another dangerously expansionist power: the man responsible, the Athenian commander Xanthippus, was the father of Pericles, the figure most associated with Athens' subsequent empire. It has happened before, Herodotus seems to be saying; it will happen again.

The *Histories* are also a rich source of evidence for Greek attitudes and values. Most markedly, Herodotus' work is characterized by strong religious convictions: by beliefs, for example, in the likelihood of divine retribution for unjust acts or in the value of divination, by a pronounced fatalism, and by a sense – expounded most fully by the Athenian character Solon in book 1 – of the unpredictability of all human fortune. At the same time, by acknowledging the possibility, for example, of others' scepticism over divination, Herodotus frequently reflects, even if he does not follow, more sceptical currents

of thought. The language and style of his argumentation also find numerous parallels in contemporary medical writings. Though his accounts of foreign peoples are moulded and structured by Greek attitudes and prejudices, Herodotus consequently provides invaluable evidence for the ways in which the Greeks perceived and understood their “barbarian” neighbours. Egyptian customs, for example, frequently mirror those of the Greeks: Egyptian women urinate in standing position and men sitting down. And the geography of Africa also inverts that of Europe: the course of the Danube provides evidence for that of the Nile.

If the allusions to Herodotus’ work in the plays of Aristophanes (or of Sophocles) are accepted, this would suggest that his work quickly became well known to a large audience, at least in Athens. Later, unreliable anecdotes of public readings in Athens and at Olympia give the same impression, though they may simply be the product of a later perception of his work as populist. Thucydides, the Athenian historian of the Peloponnesian War, on a number of occasions takes for granted knowledge of Herodotus’ work; by extending his *History* back to the aftermath of the Persian Wars, he may have seen himself as a continuator of Herodotus. In many ways, however – by his exclusion of the divine from history, by his more focused scope on the contemporary political and military affairs of Greece, and by pronouncements of his omission of *to mythodes* or “the fabulous” from his work – he may have meant to distance himself from his predecessor.

Herodotus continued to be read throughout antiquity. His influence can be detected on the 4th-century BC historians Ephorus and Theopompus – who wrote an epitome of the *Histories* – and also on Callisthenes. Nearchus, Alexander’s admiral, seems to have travelled and written with Herodotus’ stories in mind. In the Hellenistic period also Herodotus was mined for factual information by philosophers and by poets such as Apollonius Rhodius and Callimachus as well as by historians; he was commemorated by statues in Halicarnassus and in the library of the kings of Pergamum. His reputation was double-edged, however. Dionysius of Halicarnassus praised him as a stylist rather than as a historian. Others, from Ctesias – himself notoriously unreliable – in the 4th century BC onwards, denounced him as a liar or story-teller. A number of pamphlets, most famously Plutarch’s *On the Malignity of Herodotus*, criticized him for lies, plagiarism, for bias against particular Greek states, or as a “barbarian-lover”. Just as the expansion of Greek interest in the Near East that followed the conquests of Alexander the Great seems to have given his reputation fresh impetus, later events also gave Herodotus new prominence. His attempts to come to terms with the customs of foreign peoples became

more relevant with the discovery of the New World. In the light of the long struggle of the Byzantine empire against the Ottomans, the confrontation of Greeks and Persians also acquired particular potency, as is reflected in the work of the historian Laonikos Chalkokondyles.

THOMAS HARRISON

See also [Historiography](#)

Biography

Born in Halicarnassus, traditionally in 484 bc, Herodotus travelled widely, but perhaps not as widely as he would have his readers believe. He certainly spent time in Samos and Athens, and he is said to have died at Thurii in south Italy c.425 bc. His one surviving work, the *Histories*, is primarily concerned with the Persian Wars. But his description of the expansion of the Persian empire into Asia Minor, Europe, and Egypt leads him to describe the habits and customs of the peoples they encountered. Traditionally regarded since antiquity as the “Father of History”.

Heroes and Heroines

In the Homeric poems the word *heros* designates a living warrior or another individual of high social standing. It is clearly a term of respect and attaches to groups of warriors such as the Achaeans and Danaans, as well as to individuals such as Protesilaus and Menelaus in the *Iliad*, and to the poet Demodocus and the young Telemachus in the *Odyssey*. By contrast, in Greek cult the word *heros* (and later *heroine* or *heroissa*) refers to a person whose powers had been so remarkable in life that he or she was honoured in death as attaining a status between god and mortal. These cults of heroes were distinct from the family cult of the dead. The cult of heroes has been taken back to the Bronze Age, but archaeological evidence for this distinctive cult of the dead begins to appear in the early 8th century BC – the age in which the Homeric poems were taking shape and being performed throughout the Greek world. A connection between the spread of the *Iliad* and *Odyssey* and the emergence of hero cults has often been asserted, as has a connection between hero cult and the rise of the polis. The heroes of the Homeric poems – Achilles, Agamemnon, Menelaus and Helen, Meriones and Diomedes, Odysseus and Alcinous – were recipients of a hero cult both in their native countries and throughout the Greek world. Many, such as Achilles and Agamemnon, were worshipped far from their native lands: Achilles was worshipped in the Troad and Black Sea and Agamemnon in Tarentum.

This is remarkable, since it is axiomatic of the cult of heroes that these cults are tightly bound to a single place (usually a grave with its monuments) and are the expression of group identity. Although worship of heroes and heroines can reasonably be connected with the rise of the polis, the worship of the heroes of the Homeric epics, like the cult of Homer himself, is Panhellenic.

There was nothing like a cult of heroes in the ancient Near East, although Lycian dynasts adopted the cult in the 4th century BC. In the *Iliad* the descriptions of the cults of Erechtheus and Sarpedon have plausibly been taken as reflections of Homer's awareness of hero cult. But it is only in the myth of the ages in Hesiod's *Works and Days* that the race of heroes emerges as a distinct historical phenomenon. This race is inserted in the succession of metallic ages known from the Book of Daniel (gold, silver, bronze, and iron). Coming after the age of bronze, the heroes and "half-gods" (*hemitheoi*) who fought at Thebes and Troy are recognized as receiving honours from the gods in death by being transported to the Islands of the Blest. But it is the men of the silver age who, dwelling beneath the earth, receive honours in

death, even though they neglected the gods.

The archaeological record of a hero cult derives from the deposits at the graves and grave precincts of the dead who were recipients of the cult, and from a variety of representations of the dead as the objects of worship by the living human community. Most of these cults are anonymous. The most striking early example of such a cult is the 7th-century BC *heroon* (hero shrine) of a warrior buried with rich grave offerings in the grave complex at the west gate of Eretria in Euboea. There are later reliefs from Laconia showing the heroized dead (both male and female) seated majestically on thrones, with snakes coiling about to indicate their chthonic character as heroes. More common and dating from the late 6th century BC are the reliefs (known as banquet reliefs) that show a male *heros* reclining on a banquet couch with a *phiale* (libation bowl) or *rhyton* (drinking horn) in hand to receive the libations of the living. Such a figure is associated with a seated figure representing his wife. On the upper register of the relief are the emblems of his life: these include his weapons and sometimes his horse looking in through a window in the “wall”. Below the couch is a table holding offerings of bread, fruit, and eggs. These are all aristocratic monuments and dedications in a sanctuary rather than grave monuments. Very occasionally dedications with inscriptions have been excavated in these grave precincts: at Mycenae one vase is dedicated “to the hero”, another “to Helen”, and a stele “to Menelaus” in Sparta.

Heracles was the archetype of the Greek hero. He was half divine and half human, with Zeus as his father and Alcmene as his mother. Herodotus reports that on the island of Thasos, where he had an important sanctuary, he received sacrifices both as an immortal and as a mortal. The one kind of sacrifice was performed on an altar and included libations, as well as the table companionship of the worshippers; the other kind of sacrifice was a holocaust and was deposited, with libations, in a pit (*bothros*, *eschara*); it did not involve the table fellowship of the worshippers. In the 5th century BC the worship of *heroinei* came into prominence, especially in Attica. These heroines were anonymous but they are clearly conceived of as the ancestors of the worshippers. Women did not share in what are usually counted as the four main categories of hero cult: that of the statesman, the warrior, the athlete, and the poet. Lycurgus and Chilon had their cult at Sparta; Brasidas, the Spartan general, at Amphipolis; the savage athlete Cleomedes at Astypalaea; and Archilochus had his cult on Paros. The cult of Archilochus on Paros had a history of some 800 years, and the cults of Homer throughout the Greek world were about as durable. Philosophers were also honoured by hero cults. The first cult to a philosopher we know of was Parmenides’ dedication of a

heroon to his teacher, Ameinias, in Velium (south of Naples). Cults are recorded for Pythagoras and Plato, as well as for Epicurus and his associates. These cults helped to create a sense of group identity for the members of these philosophical schools (who were most often foreigners) and gave them a kind of corporate identity.

The rise of the polis and the weakening of the grip of the great families within the Greek city state are reciprocal phenomena. The hero cult became civic and, as it did, the family cult and tending of the dead became less important, although elaborate funerary monuments persisted. Rivalling both cults was the new cult of the ruler. The cult of a living ruler emerged well before the Hellenistic age. In the early 4th century BC the Spartan general Lysander received worship on Samos, as did Antigonus II and Demetrius Poliorcetes in Athens early in the next century. With Alexander of Macedon's arrogation to himself of divine status, the cult of rulers began to rival the cult of the gods, especially in the successor kingdoms of the Ptolemies, Attalids, and Seleucids in Egypt, Asia Minor, and the east. The coinage of these states is eloquent. Where coins once showed the emblem of the city and its most important divinity (in the case of Athens the owl and Athena), the coins of Alexander and his successors displayed the portrait of the dynast as equal to the divinity of the city issuing the coin. Associated with these cults of the living ruler were sacrifices, processions, contests, and priesthoods. These paved the way for the cult of the Roman emperor and Roma in the Roman imperial period, but they were short lived and rarely survived the death of the ruler and the emergence to power of his successor.

Neither the rise of the polis nor the partial eclipse of its autonomy in the Hellenistic age arrested the continuity of the family cult and, as the franchise on heroic status became cheap, a family could declare on a small grave block or stele that this was the resting place of "Sostratos, *heros*". The term *heros*, once honorific, was demoted to the status of the term *makarites* in modern Greek – *heros*, like "blessed", simply came to mean "departed". Some families were wealthy and more ambitious. On the island of Thera in the late 3rd century BC an elaborate inscription describes the development of the cult that Epicteta established for her husband and her two sons who had predeceased her and, looking beyond her own death, herself. This will was ratified by the ephorate of the island and thus the private became public.

In her will Epicteta spoke of the precinct that was the centre of her cult as a *mouseion* (or place sacred to the Muses) and the individual graves as *heroa*, that is, monuments to heroes. The place of worship of heroes was often named after them: there is an Archilocheion on Paros and Homereia are known from Smyrna (where Homer was honoured

with a temple and library), Chios, and Alexandria. The architectural remains of such *heroa* range from a grave and precinct to the Mausoleum of Mausolus of Caria (erected by his wife after his death in 353 BC), which was one of the wonders of the ancient world and most probably the centre of a hero cult. The Greek practice of heroizing the dead also spread to Lycia, where the grave of the local dynast Erbinna is contained in the magnificent 4th-century BC Nereid monument (now in the British Museum). The great altar to Zeus at Pergamum probably also functioned as a *heroon* to the ancestral figure of Telephus. The heroic pretensions of the anonymous *heros* buried in an elaborate temple tomb in Calydon are clear from its iconography and the relief showing the local hero Meleager.

With the spread of Christianity, pagan forms of worship – including hero cult – were gradually suppressed. But some pagan temples were converted into early Christian churches, as the Parthenon was given over to the worship of the Virgin (Panaghia). Christian saints supplanted the heroes who had prepared the way for them and, like the heroes and heroines of the past, they had their own place of cult, the centre of their power, and their days on the calendar of the religious year.

Heron

Mathematician and astronomer of the 1st or 2nd century AD

Very little is known about Heron of Alexandria, and we cannot even be sure when he lived (dates from the 2nd century BC to the 3rd century AD have been suggested). He does, however, seem to be aware of the Romans, and in one of his works an argument uses as an illustration an eclipse of the moon observable in both Rome and Alexandria ten days before the spring equinox. The only such eclipse that took place in the range of periods in which Heron might have lived was in AD 62 (on 10 March). Since there is also some indication that the astronomer Ptolemy, writing in the 2nd century AD, was familiar with more sophisticated mathematical methods than those of Heron, then a date in the late 1st or early 2nd century AD looks plausible.

Heron is the author of 11 surviving treatises, largely on the practical applications of mathematics and mechanics. As practical handbooks they seem to have been modified and partially rewritten in the course of time to meet the needs of later users, and in some cases there are doubts as to how much really goes back to Heron.

The *Metrica* deals with methods of calculating areas and volumes; the *Definitions* is a collection of geometrical terms, and is probably a Byzantine compilation; the *Catoptrica* (which survives only in a medieval Latin translation) is on the mathematics of mirrors and their practical use; the *Geometrica* is a rather unstructured introduction to geometry; the *Stereometrica* deals with the theory of measuring volumes, and goes on to describe its practical application; the *Belopoieca* and the *Cheiroballistra* describe the construction of different kinds of catapult; the *Dioptra* concerns surveying, and particularly the use of the plane table; the *Mechanica* (which survives only in Arabic translation, though substantial fragments of the Greek text are preserved by Pappus) starts with simple theoretical mechanics, and goes on to describe mechanical devices such as the windlass, the lever, the screw, and the pulley, and shows how they can be used to move heavy weights; the *Automatopoietike* is about the construction of automata (largely for entertainment); and the *Pneumatica* describes devices worked by compressed air, steam, and water. A number of other works are credited to Heron, including a commentary on Euclid's *Elements*, of which a few fragments are preserved in quotations by other authors.

Although some of Heron's works contain mathematical material in the same form, and with the same goals, as traditional Euclidean geometry, what is interesting is that he reveals that Greek

mathematics was not restricted to those fields in which they were capable of devising formal proofs. He also shows how Greek mathematics could be adapted to practical use. Many procedures are carried out by the application of formulae, as they are today. He knows the formula for calculating the area of a triangle if the length of the sides is given, and another for approximately calculating a cube root, and his method of solving quadratic equations is very close to the one used today. While mathematics in the Euclidean tradition is interested in producing irrefutable proofs, and absolute precision and certainty, Heron does not hesitate to give approximate results, of a kind perfectly adequate for practical purposes. It is very much the kind of mathematics that had long been practised by the Babylonians and the Egyptians, and shows that this tradition of practical mathematics continued to develop among the Greeks alongside the Euclidean tradition that we think of as more characteristically Greek. Heron often illustrates his procedures by examples drawn from real practical situations, such as calculating the capacity of a theatre, a barrel, a well, or the hold of a ship.

He is, however, best known for his descriptions of machines, gadgets, and automata, which preserve some of the few pieces of evidence we have of the application of Greek science to practical technology. He provides, for example, one of the few instances from antiquity of harnessing the power of the wind by means of a windmill; in the example he gives, it is used to drive a mechanical organ. He describes a crude steam turbine in which steam created by boiling water in a cauldron is piped into a ball through tubes on which the ball is pivoted, and allowed to escape through outlets that drive the ball round; he also gives an account of a force pump for use in a fire engine. Many of the machines he describes are designed to amuse or impress. For example, he tells us how to construct a vessel that will, by the manipulation of air inlets, dispense pure wine, wine mixed with water, or plain water (which Heron thinks might be a good joke to play), lie describes two different ways of making a model temple whose doors will open of their own accord when a fire is lit on the altar, and another device makes a trumpet sound when a door is opened. He also describes a vending machine that dispenses water (presumably for purification purposes) when a coin is inserted, and gives an account of how to build toy theatres, where the figures are made to move by the force of millet seed or sand trickling out of a container.

It is hard to say how many of these devices were ever actually built or put into use (though some of Heron's descriptions do seem to bear the marks of practical experience). The argument sometimes put forward that Heron's work demonstrates that industrialization was

well within the grasp of Greek engineers, but that they were prevented from progressing by social or ideological considerations, is quite misplaced. In most cases, the technology of the day was not sufficiently advanced to enable the construction of more than very small devices. In the case of the steam turbine, which is often cited in this argument, the form in which Heron describes it could hardly have had a practical application. The weak point of the device is the joint between the steam pipes and the ball, which must be tight enough to prevent steam escaping, but loose enough to allow the unimpeded movement of the ball. It has been calculated that the efficiency of such a machine would be no more than 1 per cent; consequently, the effort required to gather fuel and stoke the boiler would be many times greater than any work produced.

Biography

Heron was born in Alexandria but little else is known of his life. He may have lived in the 1st or 2nd century AD. He wrote widely on mathematics and the practical applications of mathematics, notably machines, gadgets, and automata. He drew on Babylonian sources as well as the Euclidian tradition.

Herophilus c.330–c.260_{BC}

Physician

Herophilus of Chalcedon, an Alexandrian physician, was one of only two ancient scientists (the other being Erasistratus of Ceos) to perform systematic scientific dissections of human cadavers. According to controversial but plausible ancient evidence, he and Erasistratus also performed vivisections on condemned criminals handed over to them by autocratic Hellenistic rulers. Herophilus' pioneering use of human dissection led to numerous remarkable anatomical discoveries, among

them his discovery of the nerves, his distinction between sensory and “voluntary” (i.e. motor) nerves, and his description of the paths and functions of at least seven pairs of cranial nerves, including the optic nerve and the oculomotor nerve. He also identified several ventricles of the brain as well as some fine cerebral and vascular structures. Discovering a cavity in the floor of the fourth ventricle of the brain, he named it *kalamos* (“reed pen”) because of its resemblance to the carved-out groove of a writing pen. This is but one of his many contributions to modern anatomical nomenclature (*calamus scriptorius*). The confluence of the four great cranial sinuses still bears the name of its discoverer: *torcular Herophili*. His meticulous dissection of the eye also allowed him to become the first to distinguish between the cornea, retina, iris, and chorioid coat.

Herophilus’ anatomical investigations yielded considerable advances in the description and understanding of other organs too. An extant fragment from book 1 of his *Dissections*, for example, preserves the first reasonably accurate and detailed description of the human liver, while fragments of book 3 preserve his anatomical account of the male and female reproductive parts. Using the analogy of the male testicles, he discovered the ovaries or, as he called them, female “twins” (*didymoi*, “twins”, being a traditional term for the testicles). His investigation of the uterus and of the ovaries also led to his discovery of the Fallopian tubes, although (as Galen was delighted to emphasize) Herophilus failed to recognize their true course and their function. From book 4 of *Dissections* fragments of his extensive anatomy of the vascular system survive, including some concerning the anatomical distinction between veins and arteries, the heart valves, the chambers of the heart, and various complex vascular structures.

Closely linked to Herophilus’ radically new anatomical version of the human body was his physiological model of the body. The aim of his dissections and vivisections of humans and animals apparently was not only to *describe* various internal parts of the body, but also to uncover and explain their *functions*. Although insisting that all causal explanation is “hypothetical” or provisional, he freely offered causal accounts of respiration, pulsation, sensation, reproduction, dreams, and physical as well as mental diseases. Locating the “command centre” (*hegemonikon*) of the body in the fourth cerebral ventricle, i.e. in the cerebellum (which is in fact responsible, *inter alia*, for muscular coordination and for the maintenance of physical equilibrium), Herophilus apparently argued that neural transmissions occur by means of *pneuma*, a breath-like substance that runs from the brain through the nerves. This *pneuma* is ultimately derived from the external air through respiration.

Pneuma is present not only in the nerves, according to Herophilus, but also in the arteries, mixed with blood, whereas the veins carry only blood. This uncanny, though not precise, parallel to the modern recognition that the arteries carry oxygenated blood (“blood with *pneuma*” in Herophilus’ model) from the heart, whereas the veins convey deoxygenated blood (“blood without *pneuma*”, according to Herophilus) triggered a controversy that lasted many centuries, but in the end it was Herophilus’ view that prevailed, not least because the influential Galen accepted it, albeit with certain elaborations.

Herophilus’ pioneering treatise *On Pulses* became the foundation of practically all ancient pulse theories, as becomes evident in Galen’s voluminous accounts of pulse lore. A “power” or “faculty” (*dynamis*) flowing from the heart through the muscular walls of the arteries causes the regular dilation and contraction of the arteries; the words “diastole” and “systole” are further examples of Herophilus’ many enduring contributions to medical terminology. The pulsating arteries continuously “pull” the mixture of blood and *pneuma* from the heart, and distribute it to all parts of the body. Using musical analogies, Herophilus described the changing relations between *diastole* and *systole* at different stages of life as successively displaying pyrrhic, trochaic, spondaic, and iambic rhythms, i.e. in infancy, childhood, adulthood, and old age, respectively. So confident was he in the diagnostic value of the pulse that he constructed a clepsydra, adjustable for the patient’s age, to measure his patients’ pulse rates.

In his *Midwifery* Herophilus apparently tried to demystify the uterus by asserting that not only is it constituted of the same material elements as the rest of the body but it is also governed by the same “powers” or “faculties”. Certain “affections”, he said, are of course experienced only by women (conception, parturition, lactation), but there is no disease peculiar to women. His discovery of the broad ligaments, which hold the uterus in place, challenged the traditional Hippocratic theory that hysteria or hysterical suffocation is caused by the “wandering womb”. The causes of difficult childbirth, the normal duration of pregnancy, the benefits and disadvantages of menstruation, and whether the foetus is a living being are further subjects treated in this work. Tertullian, who vigorously objected to Herophilus’ use of human dissection and vivisection, also charges Herophilus with the possession of an instrument known as “foetus-slayer”, implying that he performed abortions.

His semiotic theory of diagnosis, known as a “triple-timed inference from signs”, his descriptions of the symptoms and causes of numerous physical and mental disorders, and his classification of dreams are among further achievements that provoked both admiring approval and resistance throughout antiquity.

Herophilus' revolutionary discoveries transformed Greek theoretical medicine, but it is difficult to assess their influence on ancient and Byzantine medical practice. Furthermore, resistance to his innovative methods, notably to human dissection, was immediate and forceful. Moral and religious scruples about dissection found a powerful ally in the methodological and epistemological objections of the Empiricists, a new medical "school" founded in Alexandria by Philinus of Cos, a renegade pupil of Herophilus. Although Herophilus had his followers, too – the history of the "Herophilean school" can be traced in Alexandria, Asia Minor, and elsewhere from the 3rd century BC to the 1st century AD – they never seem to have mounted an effective defence of human dissection against the Empiricists' claim that it is a clinically irrelevant and epistemologically suspect method of investigation. Herophilus' discoveries and theories nevertheless continued to have an impact, in large measure thanks to their transmission by an appreciative though not uncritical Galen, by Soranus of Ephesus, by early Byzantine medical encyclopaedists (Oribasius, Aëtius of Amida, Paul of Aegina), and by Hippocratic and Galenic commentators. When systematic human dissection was resumed in the Renaissance, the superior accuracy of Herophilus' observations was recognized anew. In the 20th century, too, innovative theorists have continued to recognize the value of some of Herophilus' insights, even if, in certain cases, reluctantly. In *The Interpretation of Dreams*, for example, Sigmund Freud comments: "I am far from seeking to maintain that I am the first writer to have the idea of deriving dreams from wishes. Those who attach importance to anticipations of this kind may go back to Classical antiquity and quote Herophilus."

Biography

Born in Chalcedon c.330 BC, Herophilus was a pupil of Praxagoras of Cos before moving to Alexandria. There he performed systematic dissections of human cadavers (and, according to some sources, vivisections on condemned criminals) which led to many important anatomical discoveries and transformed theoretical medicine. His writings included the treatises *Dissections*, *On Pulses*, and *On Midwifery*. He died c.260 BC.

Hesiod

Epic poet of the 8th or 7th century ^{BC}

The works of Hesiod, like those of Homer, deal with two disparate themes. Unlike the *Iliad* and *Odyssey*, however, which are long narratives composed to entertain, Hesiod's *Theogony* and *Works and Days* are shorter poems, instructive in their purpose. They are best understood within the framework of traditions of cosmogonical and wisdom literature prevalent in the ancient Near East (although not only there).

The *Theogony*, which seems to have been composed first (see below), deals with the creation of the universe and its peopling with gods in their generations and their semidivine offspring. After an opening hymn to the Muses and an invocation, the poet goes through divine genealogies from Chaos to the Olympians, the narrative being underpinned by the separate episodes of the divine succession myth, wherein Uranus gives way to Cronus, and Cronus and the Titans to Zeus. The poem ends – or peters out – with a catalogue of the children of goddesses and mortal men, which is closer to the later catalogue of mortal women who lay with gods than to the genuine poetry of Hesiod. Both the creation and succession myths of the *Theogony* have close parallels in oriental mythology.

After a brief introduction, most of the *Works and Days* is cast in the form of an admonition to the poet's unsatisfactory younger brother Perses. Hesiod then tells a story of Prometheus, whose deception of Zeus (over the allocation of shares in animal sacrifice, and the theft of fire, which he gave to mankind), which earned Prometheus agonizing punishment, is described at length in the *Theogony*. Here the earlier story is briefly alluded to, and its sequel is told: in revenge for the theft of fire, Zeus creates Pandora, whom he gives to Prometheus' late-thinking brother Epimetheus, with disastrous results, namely the release of evils upon mankind. The poet is then reminded of another story that traces in a different way the degradation of the human condition. This is the myth of ages, gold–silver–bronze–iron, with the insertion between the last two of the age of heroes who fought at Thebes and Troy. Hesiod then addresses the *basileis*, the chieftains whom Perses appears to have suborned, and Perses. In the bulk of the rest of the poem he gives Perses – who seems somehow to have lost his fortune and to be in need of practical instruction – advice on the agricultural tasks appropriate to each season of the year. A section on

domestic and social matters follows, and the poem concludes with an almanac of the days of the month (the “Days” of the title). The motifs of giving advice to a younger person, and the myth of ages, have parallels with eastern literature, but, as with the traditional elements in the *Theogony*, it is not possible to trace any kind of line of descent. It is to be noted as well that, despite the differences in scope and subject matter, Hesiod and Homer both composed in the same artificial epic dialect, which seems to have originated in Aeolis and Ionia, and clearly belong to the same epic tradition.

Hesiod differs from Homer not only in the nature and scope of his work, but also in the way that he presents himself to his audience. Whereas Homer is self-effacing to the point of anonymity, Hesiod goes to great pains to present and identify himself as a man with a name and occupation of his own, living in a specific milieu and with a specific background. How much of this is genuine, and how much convention, is difficult to say, but where the details he gives can be checked they seem to confirm his story. For example, he claims to live at Ascra, near Mount Helicon. The site has been identified, and his description of the local microclimate is valid even today. He says that his father came from Cyme in Aeolis to settle at Ascra, understandable enough in that he would have moved from one Aeolic-speaking place to another.

The relative dates of Hesiod and Homer (whether he be poet or redactor) are still unsettled, but it seems to be generally agreed that their lifetimes overlapped, near the turn of the 8th and 7th centuries BC. In the *Works and Days* Hesiod reveals that he once won a tripod for a poem sung at the funeral games for Amphidamas of Chalcis: it is generally agreed that the prize poem was the *Theogony*. In both poems the poet speaks freely of himself and his circumstances. Other poems attributed to Hesiod – the *Shield of Heracles* and the various *Catalogues* – are generally, and probably correctly, held to be creations of various authors of the 6th century BC. Hesiod’s position as an author within the genre is obfuscated by the fact that later ancient scholarship lumped together under his name all other catalogue poetry, as it attributed all other military epics to Homer.

The earliest critical edition of Hesiod’s text was made by Zenodotus of Ephesus, the first librarian of Alexandria, followed by Aristophanes of Byzantium (3rd-2nd century BC) and Aristarchus (2nd century BC). These and other Alexandrian scholars more or less established the text (and several of its recurrent problems, such as the authenticity of the last part of the *Works and Days*, and of the lesser poems). Substantial commentaries were written by Plutarch (1st–2nd century AD), Proclus (5th century AD), John Tzetzes (12th century), Planoudes (13th century), Moschopoulos (13th–14th centuries), and Triklinios (14th

See also [Poetry \(Epic\)](#)

Biography

An approximate contemporary of Homer, Hesiod (*fl.* c.700 BC) lived at Ascra in Boeotia where his father had settled after leaving Asia Minor. He is the author of two surviving epic poems, the *Theogony* (on the descent of the gods) and the *Works and Days* (on agriculture and the just life). Other poems have been falsely attributed to him.

Hieron I

Tyrant of Syracuse *fl.* 478–466 BC

In 480 BC, two years before Hieron I succeeded his brother Gelon as tyrant of Syracuse, the city's position as a major power among the western Greeks was confirmed by the decisive victory of the combined forces of Gelon and Theron of Acragas over the Carthaginians at Himera. The resulting security was one of the major factors that enabled Hieron to extend his power and to establish a court famed – not least because it was the poets' job to praise him and his followers – as a centre of artistic patronage.

Hieron had already exercised authority since 485 BC as governor for his brother of Gela, their ancestral home. In Syracuse he consolidated

the alliance with Acragas by marrying Theon's niece. (The link had temporarily been threatened, early in the reign, when his disgruntled brother Polyzalus, now governing Gela, attempted to form an alliance with Theron against him.) Outside Sicily, he soon laid claim to larger Panhellenic power or at least prestige. In 477 BC he was able effectively to order Anaxilas, ruler of Rhegium and Messina, not to attack Locri Epizephyrii. (Anaxilas had already been pressurized after Himera into abandoning relations with Carthage and marrying his daughter to Hieron.) In 474 BC he helped Cumae to defeat an Etruscan fleet, a success that poets were not slow to compare to the battle of Salamis, enhancing the tyrant's image as the defender of the western Greeks against barbarians. (The eastern Greeks had been similarly defended at Salamis.)

Hieron's ability to promote this image was much enhanced by his acquisition of the presence or services of poets from the Greek motherland including Aeschylus, Pindar, and Simonides of Ceos and his nephew Bacchylides. (Xenophanes of Colophon also came to Hieron's court but probably more briefly.) The most widely known celebrations of Hieron were those in the epinician odes of Pindar (*Olympian* 1, *Pythians* 1–3) and Bacchylides (*Odes* 3–5) for the victories of his teams in chariot and horse-and-rider events. The tyrant's building of a new stone theatre in Syracuse (c.475–470 BC), replacing a largely wooden one, also helped to proclaim his glory. Here, probably, was staged the Sicilian production of Aeschylus' *Persians* with its potential comparisons between Salamis and Cumae; possibly also, Tommaso Guardì suggests, Phrynicus' similarly appropriate *Phoenician Women*. (Epicharmus, the Sicilian comic playwright, no doubt also produced work – possibly including more by way of implied criticism of the tyrant – for Hieron's court.)

In 472 BC Syracuse became unequivocally the strongest force within Sicily when Hieron defeated Thrasydaeus of Acragas, Theron's less effective successor. Probably at this point Hieron could have installed his own dependants as tyrants of Acragas and Himera; James F. McGlew argues that his reason for not doing so was the desire to represent himself “as the liberator of the politically oppressed cities of Sicily”. The cities he himself had most oppressed were Catana and Naxos, which were destroyed in 476 BC after the removal of their entire population to Leontini. (Hieron's help for Chalcidian Cumae may, as David Asheri says, have been designed to “obscure the memory” of his treatment of these fellow Chalcidian foundations.) Catana was refounded as Aetna and repopled with 10,000 Dorians (half from Syracuse, half from the Peloponnese). One motive for this action was clearly, as Diodorus says, to obtain “from the recently founded city of 10,000 men ... the honours accorded to heroes”; at his

death the tyrant indeed received these honours “as having been the founder of the city”. Literature again helped to celebrate the founder and to inaugurate his settlement: Aeschylus wrote his lost *Women of Aetna*, performed in the new city probably in 471 BC, and Pindar saluted Aetna in the first Pythian ode and its governor, the loyal Chromios, in the first and ninth Nemean.

Another motive for founding Aetna was, as Diodorus realized, “to have a substantial help ready at hand for any need that might arise”. When the crisis came with the expulsion of Thrasybulus, Hieron’s brother and successor, the colonists supported him and were themselves expelled from Aetna, which became Catana once more; transferred to Inessa, they continued, according to Diodorus, to honour Hieron as their founding hero. No doubt they would have approved of Pindar’s ideal Hieron, “gentle to citizens, not begrudging to good men, and to guests a wondrous father” (*Pythian* 3); it is less certain where the truth lies between this image and that constructed by Diodorus or his source – Hieron as “avaricious and violent and, generally speaking, an utter stranger to sincerity and nobility of character”. (Gelon’s rule was milder than Hieron’s, says Diodorus; that of Thrasybulus, the last of the Deinomenid tyrants, on the other hand, was distinctly worse – he murdered many citizens, confiscated people’s property, and was rapidly overthrown.) Hieron was clearly good at seizing the main chance and at claiming, through his poets as well as his deeds, the attention of posterity. Xenophon, for instance, uses his name if little else for the tyrant who debates with Simonides the advantages and disadvantages of tyranny in his *Hieron*. But, like many other Greek tyrannies, his did not survive into the next generation. It relied largely on force. It was underpinned by no constitutional theory, uncertain of its own position. (Finley finds a “touch of reticence” in the failure of Theron, Gelon, and Hieron to put their names, titles, or symbols of office on their coins – a result perhaps of a desire for Panhellenic acknowledgement at a time when tyranny was no longer fashionable in Greece proper, where “tyrant” was, for the first time, becoming a synonym for “despot”.) But Hieron’s concern with military matters allowed commerce and agriculture to thrive; Asheri goes so far as to say that (except for the suffering of such unfortunates as the people of Catana) his rule was “a golden age for Syracuse”.

Biography

Hieron ruled Gela from 485 to 478 BC as regent for his brother Gelon. On Gelon’s death (478) Hieron succeeded him as tyrant of Syracuse. Under Hieron Syracuse became

the most powerful state in Sicily and he gained a reputation as defender of the western Greeks. He enhanced his prestige by attracting to his court poets such as Aeschylus, Pindar, Simonides, Bacchylides, and Xenophanes. He died at Aetna in 466 BC.

Hieronymus of Cardia c.364–?260 BC

Administrator and historian

Hieronymus made his name in antiquity mainly as a historical figure – a friend and ambassador of kings, a military man with a remarkable fighting record, a local governor and administrator, someone who managed to survive by switching sides at the right moment, and as a *makrobios* (long-lived person) who, notwithstanding his many wounds and war toils, reached the respectable age of 104 (Jacoby, 1962, no. 154, TT2, 6–8.). His merits as a writer and as a historian were less admired in antiquity. His work was never seen as a breakthrough in the development of Hellenistic historiography. The influence of his predecessors can be detected in the scanty remains of his work (of which even the title, or rather its contents, is variously reported). Thucydides and Xenophon might have taught him that serious history must be contemporary and "pragmatic" –that is, eyewitnessed and followed closely by an actively participating historian. His ethnogeographical introductions and digressions remind us of Herodotus. Perhaps Theopompus was his model for a new kind of historywriting in making a king or a great individual the centre of the narrative. Thanks to such traits, Hieronymus belongs to the large crowd of Alexander historians, most of them his contemporaries. Finally, his easy access to documents and memoirs kept in the chancelleries of his masters (Eumenes, Antigonus Monophthalmus, Demetrius Poliorcetes, Antigonus Gonatas) may have influenced his

style.

Ancient references to his work outline to some extent Hieronymus' impact on his successors. The first to show some acquaintance with the early literary reputation of Hieronymus is Moschion (late 3rd–early 2nd century BC), the author of a paper in honour of Micron II of Syracuse, who states that Hieronymus was much admired for his account of the carriage built to convey the body of Alexander the Great (F2). His description of the Dead Sea and its asphalt was noticed by the Hellenistic Florentine Paradoxographer (F5=10 Stern). These two early examples show what kind of material impressed most of Hieronymus' early readers. In the 2nd century BC Agatharcides of Cnidus was aware of Hieronymus' long career (T2); it is remarkable, however, that Polybius, though a great advocate of "pragmatic" history, does not mention him. In the 1st century BC Diodorus mentions Hieronymus four times as a historical figure and as the author of a history of the Diadochi (TT3–6), but he never quotes him as a source in his books 18–20, covering the same period. Dionysius of Halicarnassus, writing in the time of Augustus, includes Hieronymus in a list of historians that "no one can bear to read to the final flourish" (T12). The same Dionysius nevertheless pays homage to Hieronymus for being the first to touch upon the antiquities of Rome (F13). Dionysius' contemporary, the geographer Strabo, took an interest in Hieronymus' ethno-geographical digressions on Corinth, Thessaly and Magnetis, and Crete (F16–18). In the late 1st century AD Josephus complained that Hieronymus omitted in his book any mention of the Jews, although he served in Syria and lived in their vicinity, and concluded that some "bad feeling" must have dimmed Hieronymus' understanding to see the truth (F6). Plutarch used Hieronymus for his *Lives* of the Diadochi, and quotes him as a source in his *Life of Pyrrhus*, but surprisingly not in his *Lives* of Eumenes and Demetrius. He quotes him together with Dionysius of Halicarnassus on the number of the dead at the battle of Heraclea (F11), while on those at Ausculum he quotes him together with Pyrrhus' *Hypomnemata* (which may have been quoted by Hieronymus himself). He is also quoted, together with Phylarchus, for a marginal detail of Pyrrhus' Spartan campaign (F14).

In the 2nd century AD Appian quotes Hieronymus in his *Mithridatica* as saying that Alexander never came into contact with the peoples of Cappadocia, a view rejected by Appian himself (F3). In all likelihood, Hieronymus was Appian's main source on the life and death of two early Cappadocian rulers Ariarathes and Mithridates. But the most interesting piece of evidence on Hieronymus' reputation in the 2nd century AD comes from Pausanias, who in a section on Lysimachus includes a reference to Hieronymus' reporting that Lysimachus, during

his war against Pyrrhus, destroyed the tombs of the Epirote kings. This story seemed “incredible” to Pausanias, considering that Hieronymus “had a reputation generally of being biased against all kings except Antigonus”, that “it was malice that made him record that a Macedonian desecrated the tombs of the dead”, and that “possibly Hieronymus had grievances against Lysimachus, especially his destroying the city of the Cardians and founding Lysimachia in its stead” (F9, T11). The charge of partiality is repeated by Pausanias in connection with Pyrrhus’ death at Argos, Hieronymus’ version being “different” from the one given by the Argives themselves. Pausanias was not surprised, for “a man who associates with royalty cannot help being a partial historian” (F15). He does not bother to tell us what was Hieronymus’ version, but it evidently was not a supernatural one like that of the Argives.

The last references to Hieronymus in Roman times come from Athenaeus and from a treatise attributed to Lucian. Athenaeus includes Hieronymus in a list of historians recording the length of Perdiccas’ reign (F1). This may show that Hieronymus probably had an introduction, or a digression, on the earlier kings of Macedon. Finally, pseudo-Lucian’s *Makrobioi* includes four entries of Hieronymus’, giving the ages of Ariarathes, Mithridates, Lysimachus, and Antigonus Monophthalmus at their deaths.

No extant Latin author ever mentions Hieronymus, not even Eumenēs’ biographer Nepos, nor Quintilian in his brief survey of Greek historians (10. 1. 73–5). In Byzantine times, Stephanus of Byzantium apparently did not find in Hieronymus any toponym worth mentioning, and his history was not among the books left unread by Photios’ brother Tarasios. Yet, the concise entry in the *Suda* lexicon (T1) shows that he was not altogether forgotten.

In sum, judging from the named fragments, it must be concluded that Hieronymus did not enjoy great popularity in antiquity. His ethnogeographic digressions attracted readers more than his main political and military narrative, and he was much consulted for his numbers – years of age, numbers of dead in battles, lengths of reigns, and measures. He may have been used by historians extensively, but since they rarely acknowledge their debt to their predecessors, the result was that in antiquity nobody ever suspected that Hieronymus may be hidden in Diodorus’ books 18–20, or in Plutarch’s biographies of the Diadochi. Only in modern times was Hieronymus elevated to the rank of a great historian. On the basis of the widely accepted hypothesis that Diodorus’ books 18–20 are basically taken from Hieronymus, scholars tried to reconstruct his work, to assess its value as a history book, and even to redeem its style (although not one verbal quotation of him is preserved). Thus, he has been eulogized for

carefully collecting documents, for being a representative of “scientific historiography”, for his “lively and lucid narrative”, and for his “most appealing” section on Eumenes (on whom he is never actually quoted). The truth is that the case for finding Hieronymus in Diodorus is rather weak. No argument in favour is truly compelling. Diodorus never mentions him as a source, and the correspondence of some five named fragments to Diodorus is only partial, an argument that may be used not for but against Diodorus’ dependence on him. Hieronymus is indeed an excellent example of the modern ability of resurrecting a figure that in the Hellenic and Byzantine tradition was only a marginal one.

Biography

Born c.364 BC at Cardia in the Thracian Chersonese, Hieronymus served on the staff of his fellow Cardian Eumenes, and then with Antigonus Monophthalmus, Demetrius Poliorcetes, and Antigonus Gonatas. He is the author of a history (lost) spanning the years from the death of Alexander the Great (323 BC) to at least the death of Pyrrhus (272 BC). He is reputed to have lived to the age of 104.

Hipparchus

Astronomer, geographer, and mathematician of the 2nd century BC

Hipparchus, the first astronomer to combine observation and trigonometry, was born in Nicaea, Bithynia, and flourished in the middle of the 2nd century BC, the years of his recorded observations being between 147 and 127 BC. Ptolemy gives dates for Hipparchan observations as early as 162 BC, but this date is suspect. Quite unlike other scientists in antiquity, whose biographies tend to be preserved in anecdotal gems, Hipparchus' life is poorly known. The single biographical anecdote, that he once attended the theatre in a cloak because he had predicted rain (Aelian, *De Natura Animalium*, 7. 8), is probably spurious. Hipparchus is said to have observed in Nicaea, and Nicaean coinage of Roman imperial date bears witness to that city's claim to his heritage. There is no good evidence, contrary to some opinions, to associate Hipparchus with Alexandria (see Dicks, 1960, pp. 5–8); however, he often refers to Athens, and frequent references to Rhodes suggest that he spent much of his career there.

Although Hipparchus' writings are almost entirely lost, at least 14 separate treatises are known by title; these cover specialized approaches to issues in astronomy, mathematics, and geography. Only one of his works survives in more than just a handful of disparate fragments. Still, judging by the treatment his opinions receive from subsequent authors, it is clear that Hipparchus' contribution in several areas was significant.

Hipparchus' mathematical and astronomical concepts allowed him to predict both solar and lunar eclipses: presumably he published these, and Pliny (*Naturalis Historia*, 2. 54) says that Hipparchus predicted both types of eclipses for a period of 600 years. Whether these data were actually calculated by Hipparchus or digested by him from Babylonian sources remains unclear; but his combination of Babylonian and Greek intellectual traditions produced astronomical knowledge of crucial importance well beyond Ptolemy's transmission of it. Ptolemy, who wrote in the 2nd century AD, had studied Hipparchus carefully but was more interested in improving upon Hipparchus' data than he was in preserving them. Hipparchus, however, retains the distinction of having turned astronomy into a mathematical, predictive science. Dicks (p. 11) regards him as a scientist who was "patient, painstaking, accurate, unwilling to theorize except on definite data which can be scientifically checked and verified, content if his work makes even a small contribution to the general body of knowledge".

Hipparchus was the first to use trigonometry in a precise method – i.e. not by estimation as Aristarchus and Archimedes had – and was

the first to construct a chord table, the first element of trigonometry (see *On Chords in a Circle*). His general solution for trigonometrical problems was “as effective as, if more cumbersome than, those of modern trigonometry” (Toomer, 1978, p. 209). Using this tool, Hipparchus calculated the parallax of celestial objects and accurately calculated both solar and lunar parallax. The latter calculation, 58', differs from the International Astronomical Union's value of 57.02'.688", or by less than 2 per cent. Indeed, most of Hipparchus' figures are of similar accuracy, e.g. his calculated length of the tropical year (365.2467 days) differs from the modern value by just 0.0042 of one day, or about six minutes. Concerning his measurement of the sun's size and distance from the earth with crude and scanty data, Toomer (p. 215) calls Hipparchus' methods “a tour de force”. Hipparchus' solar theory was adopted by Ptolemy unchanged, and others, including Vettius Valens, used it as well. He observed a 2-degree precession of Spica over 154 years, between Timocharis' observation and his own (made in 130 BC), and thus anticipated the precession of the equinoxes, and calculated the time it takes for the equinoctial points to make a complete revolution around the earth's celestial perspective. For tools, Hipparchus seems to have used a dioptra and a celestial sphere; he may, in fact, have invented the plane astrolabe.

Hipparchus' *Commentary on the Phaenomena of Aratus and Eudoxus* contains less of the scientific calculation and explication than we might expect to find in his works. It is, nevertheless, important as a representative of this writer, since it contains much solid argument and not a little of the urgency that Strabo saw in Hipparchus' dispute with Eratosthenes' geographical treatise. About a century before Hipparchus' birth, the Alexandrian poet Aratus had written his great didactic poem on the constellations. Drawing freely upon the astronomy of Eudoxus of Cnidus (fl. 340 BC), Aratus composed the *Phaenomena* (c. 276 BC). To the astronomer possessed of mathematical and observational skills, the eloquence of Aratus' poetry could not compensate for the poem's factual errors. The addressee of the *Commentary*, the otherwise unknown Aeschylion, had shown interest in the poem's astronomy and thus receives from Hipparchus a detailed criticism of its astronomical fallacies. The *Commentary* consists of three books, which comprise extensive criticism of both Aratus' poem and its fundamental basis provided by Eudoxus, and detailed listings of simultaneous risings and settings of constellations. Additionally, Hipparchus addresses mistaken beliefs of his own contemporaries, specifically those of the mathematician Attalus (fl. mid-2nd century BC). Arguing against the entrenched popularity of Eudoxus, Aratus, and Attalus, however, proved unsuccessful. Still, painstaking analysis of

the data in the *Commentary* “has revealed, and will reveal, a surprising amount” about ancient misunderstandings of Hipparchus and the importance of his research (Toomer, 1978, p. 208).

Hipparchus’ other writings include a treatise in which he used mathematical data to contradict Eratosthenes’ great *Geographica*, especially the geographical and mathematical details. It is surprising to find in his bibliography a treatise on astrology. He also wrote on the calendar, on optics, on permutations and combinations, and, perhaps, on gravity (*On Objects Carried Down by Their Weight*).

Hippocrates c.460–c.370_{BC}

Physician

Hippocrates of Cos, a Greek physician already renowned by the time of Plato and Aristotle, remains an elusive historical figure despite his fame as the founder of scientific medicine. The earliest characterizations of Hippocrates – for example, in Plato’s *Phaedrus* – do not seem to be fully compatible with any of the more than 60 extant works already attributed to him in antiquity (and known in modern times as the Hippocratic Corpus). Furthermore, not even the extant Hippocratic treatises believed by modern scholars to have been

written as early as the 5th century BC (for example, *Airs Waters Places*, *Sacred Disease*, *Prognosis*, *Prorrhetic II*, *Epidemics I* and *III*, *Art*, *Ancient Medicine*, *Nature of Humans*, *Regimen in Acute Diseases*, and *Winds*) can be ascribed with certainty to the historical Hippocrates, Epigraphic and literary evidence renders it likely, however, that Hippocrates was only one of several physicians called “Hippocrates”, that he belonged to a famous family of physicians, that he claimed patrilineal descent from Asclepius, that he was born on the island of Cos, and that he later lived in Thessaly.

The doctrinal, methodological, and stylistic heterogeneity displayed within the Hippocratic Corpus suggests that its texts were composed, for the most part, between 430 and 330 BC by a variety of authors, drawing on divergent traditions, and that these texts gradually became collected under the name of Hippocrates, starting in the early Hellenistic period. “Hippocrates” remained a magnet for medical texts in the later Hellenistic and Roman periods: his name became attached to post-Classical works such as *Heart*, *Nutriments*, *Law*, *Precepts*, and *Decorum*. Despite the pluralism of traditions represented in the Hippocratic collection, it displays certain recurrent commitments. Among these is an emphasis on meticulous observation (e.g. *Epidemics*, *Prognostic*, *In the Surgery*, *Diseases II*, *Sacred Disease*), on rational inference from observed signs, and on non-divine causes.

The Hippocratic secularization of explanation, i.e. explicitly substituting “natural”, physical causes for divine agency, is visible, for example, in the explanations of the Scythians’ impotence in *Airs Waters Places* and of epilepsy in *Sacred Disease* (which also offers the first explicit systematic criticism of magic). Furthermore, *Nature of Humans* distinguishes between general diseases caused by miasmatic air (which affects numerous people in similar ways) and particular diseases caused by individual regimen, while *Regimen in Acute Diseases* recognizes that a similar effect may be brought about by different causes, and *Regimen* introduces the distinction between cause and coincidence. In all these cases the traditional attribution of human disorders to divine intervention is usurped by an explanation in terms of the interaction of matter with matter, in accordance with the properties of the constituents of things. Some Hippocratics display little interest in aetiology, however, and others advance a cautious view of causal generalization. The author of *On Ancient Medicine*, for example, criticizes new theorists who, like philosophers, engage in general speculation and put forward reductive causal “hypotheses” (the hot, cold, dry, and wet) to explain diseases. The proven method of medicine, he claims, is instead to start from past observations of the effects of regimen.

For all their secularizing strategies, the Hippocratics do not deny the

existence of the gods or of the divine. The Hippocratic *Oath* begins by invoking Apollo, his son Asclepius, Asclepius' daughters Hygieia and Panacea, and "all gods as well as goddesses". Traditional gestures of respect for the power of the gods are present in other works too (*Regimen I* and *IV*, *Prognostic*, *Nature of Women*). Furthermore, treatises such as *Diseases of Women* accommodate not only the new Hippocratic "scientific" medicine, but also elements of traditional folk medicine, for example, in pharmacological tests for fertility or pregnancy or for the gender of the foetus.

Contest and warfare are central metaphors of Hippocratic medicine, as of modern biology. Within the body an incessant *agon* (struggle) between rival elements, juices (including humours), and parts determines health and disease. The desired outcome is sometimes depicted as a stalemate or balance between the opposing forces, but more often it is a victory of one over the other(s). Internal contestants also enter into an *agon* with external factors: *Airs Waters Places*, *Epidemics*, *Aphorisms*, *Humours*, and *Diseases of Women* present the environment (seasons, winds, sites, water) as a central determinant of health and disease.

The influential theory of bodily "humours" or liquids, whose excess or deficiency can cause disease, appears in several rival versions in the *Corpus*. A two-humour model – bile and phlegm – is invoked in *Diseases I* and *Affections*, whereas different four-humour theories appear elsewhere: phlegm, bile, blood, and water (*Generation/Nature of Child*, *Diseases IV*); phlegm, bile, black bile, and water (*Affections* 36, *Remedies*); and, the most famous version, phlegm, yellow bile, black bile, blood (*Nature of Humans*). Many Hippocratic works do not, however, make systematic use of any humoral theory. *Regimen* regards fire (hot and dry, providing motion to the body) and water (cold and wet, providing nourishment) as the constituents of living beings, while *Winds (Breaths)* argues that air inside the body is the principal cause of illness. A pluralism of traditions is also visible in Hippocratic theories of reproduction and embryology, in gynaecology, and in therapeutics.

The *Oath* displays unique features but it is not entirely incompatible with deontological emphases in other Hippocratic texts. Responsibility to one's *techne* (i.e. to one's result-oriented professional expertise and to a practice consistent with that expertise) and to its reputation is often depicted as the physician's prime motivation. The concern with reputation, perhaps along with the relative insecurity of Greek physicians within the social and economic order, might be a reason both for the defensive posture of some works (*Art*, *Law*) and for the significant role ascribed to accurate prognosis in others (*Prognostic*, *Prorrhetic I-II*, *Coan Prenotions*, *Airs Waters Places*, *Internal Affections*, *Diseases I-II*, *Regimen in Acute Diseases – Appendix*, *Crises*, *Joints*,

Fractures, Instruments of Reductions). The frequent prognosis of incurability and death, the polemics against charlatans, magicians, and incompetent practitioners, the overt awareness of iatrogenesis, and the emphasis on the avoidance of ostentation and theatricality likewise seem to be motivated by a concern with reputation.

Already in antiquity the impact of the works ascribed to Hippocrates was enormous. As early as the 3rd century BC members of rival medical schools began to write Hippocratic lexicæ and extensive commentaries on Hippocratic texts, and a commentary of the 1st century BC by Apollonius of Citium on the Hippocratic treatise *On Joints* is extant. This exegetical tradition remained active for centuries. The most influential Hippocratic reader of all time was probably Galen, who used early 2nd-century AD editions of “Hippocrates” by Dioscurides the Younger and Artemidorus Capiton. Early Byzantine medical encyclopaedists (Oribasius, Aëtius of Amida, Paul of Aegina) as well as numerous Church Fathers and philosophers, including the Aristotelian commentators, also gave Hippocrates ample recognition, but Galen’s commentaries decisively shaped later Alexandrian and Byzantine commentaries on Hippocrates (e.g. by Palladios, Stephanos of Athens, John of Alexandria) as well as the method of teaching “Hippocrates”. The medieval translations of Galen’s Hippocratic commentaries into Latin, Syriac, and Arabic ensured that Galen presented posterity, both in the east and in the west, with a version of “Hippocrates” that became a culturally obligatory point of departure for subsequent European medicine until the early modern era.

Hippocrates’ *Oath*, translated by the author

1.
 - i. I swear
 - ii. 3.1631 by Apollo the Physician and by Asclepius and
by health and Panacea and
by all the gods as well as goddesses, making them judges [witnesses],
 - iii. to bring the following oath and written covenant to fulfilment,
 - iv. in accordance with my power and judgement:
2.
 - i. to regard him who has taught me this *techne* as equal to my parents,
and
 - ii. to share, in partnership, my livelihood with him and to give him a
share when he is in need of necessities, and
 - iii. to judge the offspring [coming] from him equal [my] male siblings,
and
 - iv. to teach them this *techne*,
should they desire to learn [it],
without fee and written covenant, and
 - v. to give a share

- both of rules
and of lectures,
and of all the rest of learning,
to my sons and
to the [sons] of him who has taught me and
to the pupils who have
both made a written contract and
sworn by a medical convention but by no other.
3.
 - i. And I will use regimens
for the benefit of the ill
in accordance with my ability and my judgement,
 - ii. but from [what is] to their harm or injustice
I will keep [them].
 4.
 - i. And I will not give a drug that is deadly to anyone if asked [for it],
 - ii. nor will I suggest the way to such a counsel.
 - iii. And likewise I will not give a woman a destructive pessary.
 5.
 - i. And in a pure and holy way
 - ii. I will guard
 - iii. my life and my *techne*.
 6.
 - i. I will not cut,
and certainly not those suffering from stone,
 - ii. but I will cede [this]
to men [who are] practitioners of this activity.
 7.
 - i. Into as many houses as I may enter,
I will go for the benefit of the ill,
 - ii. while being far from all voluntary and destructive injustice,
especially from sexual acts
both upon women's bodies
and upon men's,
both of the free
and of the slaves.
 8.
 1. And about whatever I may see or hear
in treatment,
or even without treatment,
in the life of human beings
– things that should not ever be blurted out outside –
 2. I will remain silent,
holding such things to be unutterable [sacred, not to be divulged].
 9.
 - i.
 - a. If I render this oath fulfilled,
and if I do not blur and confound it [making it to no effect],
 - b. may it be [granted] to me to enjoy the benefits
both of life and of *techne*,
 - c. being held in good repute
among all human beings
for time eternal,
 - ii.
 - a. If, however, I transgress
and perjure myself,
 - b. the opposite of these.

Biography

Born c.460 BC in Cos, Hippocrates was the most renowned physician of antiquity, yet detailed knowledge of his life remains elusive. More than 60 extant works were attributed to him in antiquity and are now known as the Hippocratic Corpus. Most probably he was one of several physicians with the name Hippocrates, and he belonged to a family of physicians. Most of the "Hippocratic" texts seem to have been written between 430 and 330 BC.

Writings

Oeuvres complètes, edited by Emile Littré, 10 vols, Paris: Baillière, 1839–61 (with French translation, copious introductions, and indices; the only relatively complete modern edition).

Hippocrates, translated by W.H.S. Jones, E.T. Wellington, Paul Potter and Wesley D. Smith, 8 vols, London: Heinemann, New York: Putnam, and Cambridge, Massachusetts: Harvard University Press, 1923–95 (Loeb edition).

Historiography

Antiquity

Historie (inquiry) is the Ionic form of what in other Greek dialects is *historia*. The term is, however, first used by the Ionian writer Herodotus, who talks about “the presentation of his research”, undertaken “to preserve the actions of individuals from fading with time and so that the great and wondrous works of peoples, both Greeks and foreigners, should not lack renown” (1. 1). It quickly becomes apparent that any examination of this undertaking inevitably involves consideration of the various techniques and procedures – and raises several questions. For example, when did people first wish to preserve a record of their achievements, and what sort of achievements, particularly? How did they remember their past? How did they reckon the passage of time? Why does all this, for the Greeks at any rate, seem to have begun in “Ionia”?

Although there is no general agreement over the details, certain broad points can be made. As the term *historiography* implies, literacy is a prerequisite for the production of real history – illiterate peoples may have memorized lists of rulers, memorials of great deeds, and even elaborate sagas, but these productions lack the analytical and comparative approach to evidence that is possible only with writing (although oral tradition always remained an important source in Greek historiography). In the Near East and Egypt there was a long tradition, going back to the 3rd millennium BC, of recording the names of rulers and their deeds; and in the Jewish/Hebrew religious tradition there were certain works that can, by the strictest definition, be called historical. Accordingly, just as “Ionia” absorbed and developed crucial elements of eastern mathematics and astronomy, it is equally possible that the fundamentals of chronography and local and regional history and the recording of the great deeds of individuals came to the Greeks from the same source. It was in “Ionia” that the earliest prose accounts appeared of the shape of the world, the customs of various peoples, and examinations of myth and genealogy, and it was here too that local histories first began to be written: little of this work survives beyond testimonia, but Hecataeus of Miletus (*fl.* c.500 BC), writing on geography and genealogy, was important and influential (369 fragments of his work survive in F. Jacoby’s *Die Fragmente der griechischen Historiker* (1923–), where he is the first historian listed). This Ionian tradition persisted to at least the end of the 5th century BC, as can be seen from the career of Hellanicus of Lesbos (c.480–after 400 BC; 201 fragments survive), among whose numerous works were the *Priestesses of Hera at Argos* (cited apparently by Thucydides at 2. 2) and the first *Atthis*, or local history of Attica.

The Homeric poems, too, exercised an important influence on Greek historiography, though they are not themselves history. They are

concerned with the past, however, and Homer frequently refers to the differences between the past and the present and to the human desire to be remembered: great deeds are commemorated in various ways and human glory is closely connected with prowess in war; genealogies occur frequently, as does the idea of the community as the vital centre for human existence (cf. *Iliad*, 5. 304–05, 6. 145–211, 22. 304–05; *Odyssey*, 1. 2–3). The date of “Homer” remains controversial, but if West’s recent suggestion that the *Iliad* was composed in its monumental form between 670 and 640 BC (with a preference for 660–650 BC) is cogent, then we are clearly in the literate period; Greek colonization, both in the Black Sea area and in the west, was in full swing; and the main themes of the Homeric poems and the impulses that led to the early Ionian prose chronicles are not only similar but nearly contemporaneous.

Herodotus of Halicarnassus (dates quite uncertain, but probably writing after 440 BC) is, then, heir not only to the various subjects and techniques of the earlier Ionian prose-writers but also to the Homeric subject matter, war, and to Homeric *mimesis*, the recreation of a scene so vividly that the reader seems almost to be part of it. In examining Herodotus’ work we have the advantage, rare in Classical historiography, of studying something that is whole and complete: we can see its entire shape as its author planned it, and we do not have to worry about “incomplete revisions” or “strata of composition”, nor must we try to identify second, or even third, thoughts on certain topics, as is the case in Thucydidean studies. The great story of the war between Greeks and non-Greeks, which goes back to mythical times and culminates with the victories at Plataea and Mycale and their immediate aftermath in 479 BC, starts with extended ethnographic accounts of the parts of the Persian empire and follows its growth in a historical sequence; the attempts by Darius and Xerxes to expand the empire by incorporating into it all of mainland Greece lead to the climactic war narrative in books 7 to 9. Underlying all of this are the basic notions of action and reaction: someone does something to another, the latter responds, the first does something else, and so on – this is the basic causative impulse in human affairs.

Any reader of Herodotus quickly realizes that he is, above all, a master story-teller; we also know that he recited “sections” of his work before audiences. Over the years and as a result of frequent retelling, these tales came to take on a smooth, effortless form; their sources, whether oral or written, or the result of personal experience or observation, were blurred and “improved on” for narrative effect (the end result of this process can be seen in Hammond’s brilliant analysis of Herodotus’ narrative techniques in the account of events leading up to Xerxes’ invasion in 480 BC (7. 117–79) – the “Chinese box”

construction, with recurring verbal markers to indicate stages going into and coming out of a particular topic, and a succession of separate narrative “strings” with key phrases to signal the move from one theme to another). Accordingly, Herodotus’ tales, particularly those pertaining to strange and wondrous sights and remarkable events in far-off lands, should not be pressed too far. He is more likely to be careful (and correspondingly more accurate) in books 7 to 9, which deal with near-contemporary history. Finally, we may assume that, when he decided to commit his “lectures” to written form, the whole process was relatively quick and easy.

With the Athenian Thucydides in the later 5th century BC we come to the most interesting, complex, and, above all, authoritative of ancient historians. From Herodotus he may have derived the idea of writing the history of a war, but in Thucydides’ case it was a contemporary war. Furthermore, Thucydides talks directly to us about his sources, his methods of handling evidence, and about the speeches that are so striking a feature of his account (1. 21–22). He was not the first historian to provide speeches, but his are so important to his history as a means of conveying important information and forming impressions in the audience’s mind that they would merit the attention lavished on them by scholars and critics even if they had not started a practice almost universal in Greek historiography thereafter. However, there is no agreement about what Thucydides meant in a very difficult sentence about his practice with regard to speeches (1. 22. 1): Wilson’s suggestion “as it seemed likely to me – keeping as closely as possible to all the points made in what was actually said – that each party would have appropriately spoken about the various situations, so I have written” is possibly as cogent a translation (for avoiding an apparent but improbable self-contradiction in the Greek) as we are likely to get. This was Thucydides’ aim: whether he achieved it (or even stuck to it) is another matter altogether. We shall never know how closely the Funeral Oration in book 2 approximates to the actual words uttered by Pericles in the autumn of 431 BC. As for events, Thucydides claims to have written with “the utmost possible accuracy” (*akribēia*: 1. 22. 2). Finally, he expresses the hope that his history will be “useful”: he does not state that it will provide a guide for future conduct or furnish pleasure to the reader. Such ideas about history writing came rather later.

Thucydides has always been regarded as an “objective” historian. Modern literary theory, however, denies the possibility of any such absolute concept: in strict logic this is undeniable and recent studies of Thucydides have tended to emphasize such features as his habit of telling his audience what his characters are thinking and his use of phrases designed to make his audience trust him (this is Thucydides

the “artful reporter”, in Hunter’s memorable phrase). However, “objectivity” is a very slippery term and Thucydides still stands out as a beacon for accuracy among ancient historians.

The Thucydidean narrative breaks off abruptly in the year 411 BC and several later historians seem to have aimed to carry on from the break point – more or less: the Athenian Xenophon wrote, over a considerable period of time, the *Hellenica* in seven books, which extended from 411 to 362 BC; the “Oxyrhynchus historian” (probably the Athenian Cratippus: see Harding), of whose work approximately 20 pages of Greek text survive on papyrus and written in the Thucydidean manner (though with no speeches), was probably a contemporary of the events described and covered the period from 411 to 395 BC; and Theopompus of Chios produced *Hellenica* in 12 books, covering the period from 411 to 394 BC; Theopompus, one of the most important historians of the 4th century BC, also produced a new kind of history, focusing on the career of a single individual: his *Philippicae Historiae* in 58 books represented a “universal history” (involving deeds of Greeks and foreigners alike; see below) on a very broad canvas indeed, with numerous digressions and a highly rhetorical style, but with Philip II of Macedon as the unifying core. This type of history, centred on a single, magnetic personality, was continued in the Alexander-histories of Callisthenes, Aristobulus, Chares, Nearchus, Ptolemy I, and many others, including the much later but extant Arrian of Nicomedia (2nd century AD).

The other major historian of the 4th century BC was Ephorus of Cyme (c.405–330 BC), whose work in 30 books, from the return of the Heraclidae to the siege of Perinthus in 340 BC, was probably the earliest “universal history”. Though not highly regarded today (perhaps unfairly: for a balanced assessment see Fornara, pp. 42–46), Ephorus was widely known and quoted throughout antiquity and was the main source (for Classical Greek history) of Diodorus of Sicily (1st century BC) of whose “universal history”, the *Bibliotheca*, 15 from an original 40 books survive.

Among the major trends in historiographic theory in the generations immediately following Thucydides are the notion that history can teach us moral lessons (cf. Xenophon, *Hellenica*, 5. 3. 7) and a parallel tendency to pass judgement on, or “award points” to, an individual, an entire career, or the behaviour of a political entity (a self-important fatuity that continues to the present day, but which, again, starts with Xenophon; cf. *Hellenica*, 7. 5. 8). Ephorus was particularly prone to these practices, especially with regard to the characters of individuals; and these moralizing appraisals, with particular emphasis on praise and blame, became a characteristic feature of later historiography.

Other, older concerns continued to be addressed, however: Timaeus

of Tauromenium in Sicily (c.350–260 BC) produced a chronology based on Olympic victors, cross-referenced to Athenian archons, Spartan kings and ephors, and priestesses of Hera at Argos: dating by Olympiads soon became standard practice. In addition, Timaeus wrote an extensive history of Sicily in 38 books, incorporating geography and ethnography as well as political history. Furthermore, he is remembered for his critical analysis of the works of his predecessors, which often degenerated into hostile abuse.

The moralizing tendencies of Ephorus and the critical use of earlier historians by Timaeus were developed by Polybius of Megalopolis (c.200–c.118 BC), of whose 40-book history of Rome's rise to supremacy in the Mediterranean world substantial portions survive. Polybius also believed that history was useful to politicians and that study of the past could enable reasonable predictions about the future to be made (cf. 3. 31–32), an idea that he may have absorbed during his stay in Rome and which finds its most striking expression in the preface to Livy's history *Ab Urbe Condita*. As for sources, Polybius quotes his predecessors, often at considerable length, which is valuable, but frequently also with hostile analysis (cf. his attack on the credibility of Fabius Pictor at 3. 8. 1–9. 5, or his citation of Callisthenes on the Battle of Issus at 12. 17–22). From his examination of Rome's rapid development of overwhelming power Polybius concluded that the city's governance had been the main contributing factor and from this he developed 5th-century ideas of a “mixed” constitution (in this case a combination of monarchy, oligarchy, and democracy, with a precise combination of these three elements) into his main explanatory concept.

Given the eventual predominance of Rome, it is not surprising that several Greek writers at different periods wrote large-scale histories, most notably the scholarly and perceptive Dionysius of Halicarnassus (late 1st century BC), who wrote 30 books (the first 11 survive), from the pre-foundation legends to 264 BC, and Cassius Dio of Nicaea in Bithynia (c.AD 164–after 229), a Greek-speaking senator and imperial *amicus*, who wrote a *Roman History* in 80 books, from the beginning to AD 229, of which nearly 24 survive complete, with excerpts and epitomes of the rest. Dio is an interesting combination of Greek and Roman ideas and culture – and historiography: he writes Classical Attic Greek, is much influenced by Thucydides (though he can be moralizing and rhetorical and, at times, too free in inventing speeches), and provides a perceptive analysis of the implications of the change from republic to principate, along with what is, in reality, a political manifesto suggesting solutions for the problems faced by the empire in the 3rd century AD (cf. Reinhold, pp. 219–21).

Emphasis must also be placed on the sheer volume and diversity of

the historiography of the Hellenistic period in particular. Obviously, in a brief survey such as this, only a few of the many hundreds of names known to us can be mentioned. For example, there was a vast outpouring of historical works in the 2nd century AD, on which see the sardonic essay “How to Write History” by the contemporary Lucian of Samosata; see also Baldwin’s discussion.

Homer

Epic poet of the 8th or 7th century BC

“Homer” is the name associated since ancient times with the author of the *Iliad* and the *Odyssey*, the two epic poems that form the earliest surviving Greek literature and which are probably the most important and influential works ever written in Greek. The *Iliad* describes the Trojan War, the ten-year struggle by the Greeks to conquer the city of Troy in Asia Minor and to recapture Helen, the queen of Sparta who was abducted by the Trojan prince Paris. The poem covers only a few days in the last year of the war, when Achilles, the greatest of the

Greek heroes, is insulted by Agamemnon, his commander in chief, and refuses to fight. The Greeks are badly defeated in his absence and plead for his help, but he gives it only when his close friend Patroclus is killed by Hector, the bravest of the Trojan princes. At that point Achilles returns to the battle and kills Hector, though he knows that he is fated to die if he does so. Hector's family mourns him greatly, and his aged father Priam, the king of Troy, comes to Achilles in secret to ransom his son's body, which Achilles allows him to do. These events are influenced but not entirely controlled by the gods, who take an active interest in the course of the war but are far from united in their aims and often engage in highly undignified bickering. The theme of the poem is the wrath of Achilles; it begins with the actions that caused that anger and ends when Achilles lays aside his anger to share Priam's grief, and the story is amazingly cohesive and unified for a poem of such length. Nevertheless the poet also manages, by means of well-placed digressions, to give the story of the entire war in the course of the poem.

The *Odyssey* takes place after the end of the Trojan War and chronicles the homeward journey of Odysseus, one of the Greek heroes. It begins towards the end of his wanderings, and we learn of many of his adventures only when he narrates them himself in the course of his homecoming; narration from various characters also provides us with the story of the part of the Trojan War between the end of the *Iliad* and the beginning of the *Odyssey*. The poet focuses not only on Odysseus and his adventures, but also on the courage and endurance of his wife Penelope, who waited 20 years for her husband to return, and the coming of age of their son Telemachus, who grew up without knowing his father. Both Penelope and Telemachus suffer from the crowd of suitors who occupy their house for years insisting that Penelope remarry, and the poet carefully alternates scenes describing their plight with ones detailing Odysseus' adventures. Finally the two halves of the poem come together, as Odysseus returns to his family and kills the suitors.

A number of shorter poems about the gods, known as the Homeric Hymns, are also attributed to Homer. Internal linguistic evidence suggests that some of these poems are almost as early as the *Iliad* and *Odyssey*, while others were clearly composed much later.

Nothing is known for certain about Homer himself, and his very existence is now disputed; the *Iliad* and *Odyssey* may have different authors, if either can be said to have an author at all. The epics are certainly the product of a long oral tradition, probably dating back at least to the 12th century BC. The extent to which this tradition can be taken as any sort of record of actual events in the Mycenaean period is disputed; archaeologists since Heinrich Schliemann have tended to

identify Troy with the site of Hissarlik in Turkey, which could have been destroyed by the Greeks around 1250 BC (one ancient date for the Trojan War), but many of the episodes in the poems are certainly fictional and most are probably so. Only a few place names and descriptions of objects can be traced with certainty to the Mycenaean period, and most of the material in the poems is of much later date.

The oral tradition that produced the epics went on evolving until they were written down, which cannot have been earlier than c.800 BC and may have occurred a century or more after that. Today the name “Homer” is often conventionally applied to the last bard in the series (not necessarily the same person for both epics), who presumably shaped the poems into the form in which they were first committed to writing. It is uncertain how much of the final product can be attributed to his individual genius and how much to that of his predecessors. The result of this long evolution is that the language of the *Iliad* and *Odyssey* is a mixture of dialects from different centuries and different areas of Greece; it preserves traces of very archaic features next to relatively recent innovations and is not something that was ever spoken as anyone’s natural language. Because of the prestige of the poems, however, the “epic dialect” became a recognized form of literary Greek and was often used, in whole or in part, for later Greek poetry.

Throughout antiquity the Homeric epics were regarded as indisputably the best and most important works of Greek literature, a reputation that they have never really lost. Greek school-children studied them, in preference to all other literature, from the beginning of Greek schooling, and the epics were regularly recited on all kinds of occasions both public and private. Once they had been written down, the poems stopped evolving as oral literature and attained a relatively fixed form; this was necessitated in part by their use as an authority on any matter they mentioned, from territorial claims to religious observances. The poems’ depiction of the gods as not free of human vices occasioned some discomfort among later philosophers, but not enough to undermine Homer’s authority seriously.

Virtually all of ancient literature is indebted to Homer in one way or another; his influence is particularly notable in poetry, since both the language and the mythological material of much Greek poetry are directly traceable to him, but it can also be seen in historical and philosophical works. Some later Greeks, such as Apollonius Rhodius, wrote epics of their own that were close imitations of the Homeric poems, but most writers tended to feel that Homer could not be equalled and therefore should not be directly imitated. Much of ancient art is also clearly dependent on Homer for inspiration.

Homer was the first Greek author to be the subject of scholarship;

legend has it that the 6th-century ^{BC} Athenian tyrant Pisistratus first ordered that a proper edition of the Homeric poems be compiled. This legend may be without foundation, but it is certainly true that in the Hellenistic period the great scholars of Alexandria devoted much time and energy to editing and commenting on the text of Homer, and many of their observations are still valuable today. Similarly, the enormous preponderance of Homer papyri (ancient copies of the Homeric poems on papyrus, found primarily in Egypt) over those of any other author shows that ancient scribes spent vast amounts of time copying the *Iliad* and *Odyssey*. Early quotations of Homer by other writers suggest that before the Alexandrian period there were a number of variant texts of Homer. This impression is borne out by the earliest Homeric papyri of the Alexandrian period. During that period, however, the papyri reveal the adoption of a standardized text: from about 150 ^{BC} virtually all papyri reflect a text very similar to that of the medieval manuscripts on which our own texts are based. Thus in some way the poems became codified during the Alexandrian period, though it is not clear whether this codification was entirely the work of scholars (many of whose emendations do not appear in the codified text) or whether it was also due to the changing practices of Alexandrian book copyists.

In the Roman and Byzantine periods the Homeric poems continued to be read, copied, quoted, imitated, and prized above other pagan literature, and with the introduction of Christianity their status was only slightly diminished. The popularity and importance of the epics made it impossible for the Christians to condemn them, and for the most part the pillars of the Church read and used Homer quite happily, although for some the poems' incompatibility with Christian doctrine remained a problem. Several Byzantine authors, such as Tzetzes (12th century) and Psellos (11th century), solved this problem by writing allegorical interpretations of the poems and giving them Christian meaning; in so doing they joined a long tradition of Homeric allegorization that dates back to the Hellenistic period. School curricula in Byzantine times still contained a large component of instruction in and memorization of Homer, and ability to quote from the poems from memory was considered essential in an educated man. Byzantine scholars also produced numerous works on Homer, including the 12th-century archbishop Eustathios' massive commentaries on both epics, which are still of use today. Homer also influenced many vernacular authors of the Byzantine period.

In less educated circles, however, the enormous difference between the epic dialect and the spoken Greek of later periods made the poems more and more difficult to understand, and over time their plots became less familiar to the populace as a whole. Meanwhile, of

course, the Homeric poems had been imitated by Latin poets, who in turn inspired medieval poets in western Europe. One result of this was the *Roman de Troie*, a 12th-century French poem on the Trojan War that adapts the Homeric characters into a framework of medieval Christianity, chivalry, and courtly love to the extent that they and their stories are barely recognizable. This poem was brought to Greece by Frankish occupiers and in the 14th century was translated into vernacular Greek as the “War of Troy”. It is now the longest surviving medieval Greek vernacular poem (14,367 lines).

With the fall of Constantinople in 1453 the Greeks’ contact with their literary past was greatly diminished, but the Homeric poems continued to be used as school texts in those schools that offered training in Greek (particularly those in the Greek diaspora) and so were as influential as any work of ancient Greek literature during this period. The prestige that they continued to hold is illustrated by the story of the reception of a French general sent by Napoleon to annex Corfu in 1797; after the general had delivered a learned speech sprinkled with references to Classical literature, the Corfiots handed him a copy of the *Odyssey* and replied that although the Greeks were not learned they should still be respected because of Homer. At the liberation of Greece in the 19th century Greek education became more widespread, and with it the Homeric poems, which were still used as school texts. They are in fact still so used to this day, continuing an impressive and unbroken tradition of two and a half millennia of Greek education.

The gap between Homeric Greek and the living language has continued to widen, however, resulting in a need for translations. As early as the 17th century Nikolaos Loukanis produced a paraphrase of the *Iliad* in modern Greek, but the first true modern Greek translations were not completed until Polylys’s work in the late 19th century.

Biography

Homer is traditionally assumed to be the author of the two epic poems which represent the earliest surviving examples of Greek literature, the *Iliad* and the *Odyssey*. Based on a long oral tradition, the poems were not written down before 800 BC (and possibly a century or more later); the name “Homer” is conventionally applied to the last bard in that tradition before the poems were committed to writing. All subsequent Greek literature is indebted to Homer in some way.

Homosexuality

Homosexuality and the Hellenic tradition are bedfellows of long standing. The gay man or lesbian is no longer the “woman trapped in a man’s body” or “the man trapped in a woman’s body”; but we are no nearer agreement on what “homosexuality” is than we are able to accept the diversity it represents. Social constructionists argue that no sexualities exist outside culture – that indeed the very concept of “sexuality” is a product of our modern scientific-rational culture; the essentialists proclaim that there is something that “essentially” makes people homosexual, it is a “natural fact”. With these two views unreconciled, it is clear there is no one “homosexuality”. First, male and female homosexuality must be recognized as different experiences and expressions. Secondly, “homosexuality” is a category of meaning that shifts through time, and it is simplistic to reduce all male homosexual activity to anal intercourse. Homosexuality embraces the homosocial as well as the homoerotic. David Greenberg’s masterful survey of the field has pointed out the variety so glibly united in the term “homosexuality”. Greenberg’s categories are useful in analysing the three broad periods of homosexuality in the Hellenic tradition: the

Classical, the medieval, and the modern.

Classical

Sappho provides some evidence of female homoeroticism if not homosexuality:

and you were anointed with
a perfume, scented with blossom
... although it was fit for a queen
and on a bed, soft and tender
you satisfied your desire...

no. 32 (LP 94) in Sappho, *Poems and Fragments*, translated by Josephine Balmer

Clearer evidence from the Classical period is largely restricted to male homosexuality. For Greenberg the homosexuality of Classical Athens – subject of a definitive study by Kenneth Dover – was transgenerational (in that the lover was older, the beloved little more than a boy without the first growth of a beard); it was based on a differential of power (the lover was older, richer, more experienced, and took the active role; the beloved was younger, without resources, gaining an education, and took the passive role); it was transitional (both parties filled the roles of beloved and lover at different stages); and it was not exclusive (it was indeed “just a stage they were going through”, and the lover would frequently have a wife and children at home and in due course the beloved would become an adult citizen and take a wife). This homosexuality – more accurately pederasty – played an institutionalized role in Greek society in the 5th and 4th centuries BC. Not all aspects of this part of Greek culture are clear, but neither are all aspects occluded under the rubric of the “love that dare not speak its name”. This love had its names; what is not always clear is what these names meant. The beloved was the *pais* or *eromenos*; the lover was the *erastes*. This part of human experience was socialized and circumscribed into an ideal of accepted behaviours, with some actions clearly prohibited. The beloved, the *eromenos*, was a boy of between 9 and 16, the son of a citizen, who in time would become a citizen himself. One of the leisured classes, he spent his time frequenting the gymnasia where, if he conformed to the Greek ideals of young male beauty, he would come to the attention of a prospective *erastes*, himself a member of the citizenry. The ideal was presented as a hunt: the *eromenos* was the quarry, the *erastes* the hunter. By his attentions, his presence, his example, his guidance, and more concrete gifts of cockerel, hare, or hound, the *erastes* by this theory would inculcate the “best” things of civilized life in his beloved. For his part, the beloved was expected not to give in readily to the importuning of the *erastes*. The willingness of the *erastes* to continue in the pursuit of the

apparently unwilling *eromenos* was a clear indicator of the *erastes*' excellence. At a suitable end-point, however, it was accepted that it was "creditable to grant any favour in any circumstances for the sake of becoming a better person", glossed by Dover (p. 91) as "acceptance of the teacher's thrusting penis between his thighs or in his anus is the fee which the pupil pays for good teaching or alternatively a gift from a younger person to an older person whom he has come to love and admire". Here again the Classical Greeks have a word for it: the physical expression was *diamerizein* ("intercrural intercourse"). But there were social constraints. It was assumed that the *eromenos* would gain no physical pleasure (the examples of 100 years of vase painting from 570 to 470 BC show the *eromenos* with flaccid penis and often an almost abstracted air, while the aroused *erastes* is "up for it"). And the *eromenos* was protected from the unwanted advances of an *erastes* by the laws of hubris: in myth Zeus carried off a protesting Ganymede (followed in turn by Poseidon taking Pelops) but boy citizens were protected from such outrage by the legal threat of the death penalty. However, though 4th-century BC Athens readily accepted this "homosexual" ethos of *eromenos* and *erastes* (with evidence provided by the Attic comedies of Aristophanes, by Plato, and by Aeschines' speech of 346 BC in prosecution of Timarchus), the freedoms were constrained. The *eromenos* who, voluntarily or due to parental pressure, gave his favours for material gain in overt prostitution lost his place among the citizens and could be arraigned for hubris if he subsequently attempted to act as a citizen by speaking in the assembly or holding reserved office. Similarly, the man or boy who took the passive (receptive) role in anal intercourse (who allowed himself to be penetrated) separated himself from the citizens and was ordered with women, foreigners, and prostitutes. The role of the beautiful yet aloof object of a worthy male citizen's desire was allowed the beardless youth; a coeval relationship between men – more especially if anal intercourse was imputed to it – was not. The manner in which the physical expression of a homosexual relationship forms a subverting continuum with homosocial relationships – such as between Achilles and Patroclus – caused problems for Classical Hellenism. Pausanias and Agathon continued in the relationship "too long" according to the norms, but their respective roles were clear; for Achilles and Patroclus the question was "which one is the *eromenos*, which one the *erastes*?" as the relationship had to conform to that paradigm.

Honour and Shame

A classic description of the values cherished by the ancient Greeks is offered by the speech delivered by the Athenian statesman Pericles in commemoration of those killed during the first year of the Great or Peloponnesian War between Athens and Sparta (430 BC). In this oration, so often compared to Lincoln's Gettysburg Address because of its affirmation of basic principles, Pericles stresses that the dead have won eternal praise before capping his eulogy with a final, and culminating, claim that love of honour alone never grows old and, when one is in the grip of old age and worn out, it is not the pursuit of money, as is asserted, but being honoured that confers the greater pleasure (Thucydides, 2. 44. 4). This sentiment, the supremacy of *time* or honour, is echoed time and time again, both explicitly and implicitly, throughout antiquity: thus Greek literature begins with Homer's *Iliad*, and the *Iliad* begins with the quarrel between Agamemnon and Achilles as a result of which Achilles withdraws from battle and his compatriots are slaughtered. Why does Achilles retreat to his tent? It is because the woman Briseis has been taken from him and so no honour is paid to "the best of Achaeans" (*Iliad*, 1. 412). The law of reciprocity applies: when insulted or injured the man of honour must retaliate in at least equal measure if his personal prestige is to be

upheld, and the man of honour is at his most sensitive when a woman from within the family group is in any way threatened. Athenian law, for example, regarded homicide as justified if a man engaged in illicit sex and was caught in the act with a wife or even with other female dependants, (i.e. mother, sister, or daughter), of the killer.

An excessively protective attitude towards female relatives is only one consequence of an obsession with personal and family honour. Honour depends upon the acknowledgement of others and appearance tends to be more important than the truth. "Reputation" is a kind of divinity, according to the poet Hesiod (*Works and Days*, 763–64) who also illustrates reciprocated action: if the first to be wronged in word or deed, you must never turn the other cheek but hit back as hard as you can (709–11); in other words, two wrongs definitely add up to a "right" if the rules of the honour code are observed. Honour, moreover, is reckoned to be a "commodity" and measurable; it is in short supply; and if someone else has honour, it is at your expense and you resent it and try to cut that person down to size by the application of different ranking criteria: if he is powerful or wealthy, then you attack his family background or accuse him of being morally suspect.

It is significant that the word *philotimia*, literally "love of honour", often means "jealousy". As Aristotle remarks, "those who love honour are more envious than those who do not love honour" (*Rhetoric*, 1387b). Recognition, and therefore success, however achieved, is crucial; "if I had succeeded", says the nurse in Euripides' *Hippolytus*, "I would be counted among the wise, since we possess a reputation for intelligence according to success" (700–01). Poverty is a mark of failure, and the poor man has no honour or, as Euripides put it in his *Electra*, "poverty is a disease and it teaches a man to be evil because of his need" (375–76). But a Greek would prefer to scratch a bare living from the soil rather than work for another, for it was the slave who was at another's beck and call and a slave, again, can lay no claim to honour. Greek society was intensely competitive at every level, whether those engaged in competition were athletes, dramatists, statesmen, or soldiers. And it was the relentless pursuit of honour, often at others' expense, that made society so agonistic and, therefore, unstable.

You undertake action to gain honour; you refrain from action to avoid shame or *aidos*. The Christian virtue of guilt was replaced in antiquity by the concept of shame. Hector refuses to run from Achilles though he knows he cannot prevail: "I feel shame before the Trojans, men and women, in case someone my inferior says 'trusting in his strength Hector has destroyed his people'; it would be far better for me to face up to Achilles" (*Iliad*, 22. 105–09). When the Greeks waver on the field of battle the hero Ajax tells them to be men and place

shame in their hearts and to feel shame towards each other. Being typically Greek, Ajax also emphasizes the practical advantage of not fleeing – “when men feel shame more survive than are killed and no glory or safety is to be found in flight” (15. 561–64).

But shame acts as a deterrent far away from battle. The goddess Thetis is ashamed to join the deities because of her misery (*Iliad*, 24. 90–91). Women especially must exhibit shame, keeping well out of the way of men: the great glory of a woman, Pericles claims in the Funeral Speech, is to be least talked about by men whether they are praising or criticizing her (Thucydides, 2. 45. 2). What is required of women is similarly applicable to the young: when the young Telemachus came to Pylos in the *Odyssey* in search of news of his father, he is urged to approach the very much older Nestor without hesitation – “You’ve no need of shame, none at all” – but replies, “How am I to approach him, how shall I address him? That a young man should question an older man is a matter of shame” (*Odyssey*, 3. 14 and 22. 24). Penelope’s suitors are said to have no share of shame, since they behave outrageously in another’s house (*Odyssey*, 20. 170–71). In the *Iliad* Apollo comments that Achilles, in maltreating the body of the dead Hector, has destroyed pity and has no shame (24. 44–45). He further adds that shame greatly hinders and helps men (45), and this ambiguous quality associated with *aidos* is also acknowledged by Hesiod (*Works and Days*, 318). Shame is no use if you are destitute, merely inhibiting action; then you need to be bold, to exhibit what is termed *tharsos*. When Telemachus and Nestor actually get down to conversation in the *Odyssey*, the former speaks “having been made bold, for Athene herself placed boldness in his heart” (3. 76–77).

Hospitality

The relationship between host and guest, *xenia* (“guest-friendship”), is one of the most hallowed in Greek culture. *Xenia* may exist between two individuals (usually two males), two groups (such as two towns),

or an individual (especially a ruler) and a group. For example, Herodotus describes the relationship of Croesus (king of Lydia in the 6th century BC) with the Ionians (1. 27. 50) and Spartans (1. 69. 3) with the term *xenia*. Guest-friendship also existed on an interfamilial and intergenerational level. For example, if a person's father had formed a guest-friendship with another man, the son could expect hospitality from the same household, even if neither the father nor the original host was still alive. In Homer's *Iliad* (6. 215–31) the Trojan Glaucus and the Greek Diomedes break off their duel when they learn that their fathers were guest-friends. The two warriors even exchange gifts, just as their fathers once had. The Homeric ideal carried over into society as is evidenced in the 4th century BC by Demosthenes' speech *Against Polycles* (50.56), which notes how Pasion's son was able to borrow money because of his father's numerous guest-friends. The example of Pasion's son also shows how guest-friendship might also provide a person with relief in times of financial difficulty. Even people who were fugitives from the law or exiled from their native town could expect hospitable treatment (see Demosthenes, 23. 85 (*Against Aristocrates*); Diodorus, 14. 32. 1).

After contact with a stranger was initiated, the guest-friendship was ritualized through the clasping of hands, the partaking of food, and the giving of gifts, especially those given by the host to the guest. The guest could not "insult his host", "demand or take what is not offered", or "refuse what is offered" (Pitt-Rivers, pp. 27–28). On the other hand, the Greek host could not "insult his guest", fail "to protect his guest" or his guest's honour, or fail to be as hospitable as possible (Pitt-Rivers, p. 28). Greek hosts had the added responsibility of providing for the stranger who might arrive unannounced and at an inopportune time. Even if a Greek was approached by a stranger at an inconvenient moment, turning him away was considered disgraceful. The extremes to which a Greek would go to uphold the custom of guest-friendship are displayed in Euripides' *Alcestis* (438 BC), where Heracles arrives unexpectedly at Admetus' home just as Admetus is preparing to bury his wife Alcestis. Despite Heracles' inconvenient arrival, the over-hospitable Admetus refuses to turn him away and even pretends that he is conducting a funeral not for his wife, but for a maidservant.

Besides having to provide for a complete stranger at an inopportune time, Greek hosts seem to have felt compelled to provide the most lavish hospitality possible, even if it was beyond their financial means. In Homer's *Odyssey* the guests of nobles such as Nestor, Menelaus, and Alcinous not only receive the basic amenities (food, drink, and lodging), but are also bathed, given clothing, offered or given transport to their next destination, and given valuable gifts to take

with them. Such hospitality recalls the Acragantine Tellias, who lived in the late 5th century BC. Tellias was so wealthy that he had servants stationed at his gates who would invite all strangers who passed by to be his guests. Tellias was even said to have entertained and clothed 500 cavalry from Gela (Diodorus 13. 83. 2). Likewise, Plutarch (*Demetrius*, 12. 1–2) reports that in the late 4th century BC an Athenian proposed that whenever Demetrius I of Macedonia visited Athens he should be provided with the same hospitable honours (*xenismoi*) granted to the divinities Demeter and Dionysus, and that the citizen who was most lavish in his hospitality towards Demetrius should be granted an offering of dedication at public expense. Ibis is in contrast, though, with *Odyssey* 14, where the disguised Odysseus tests the hospitality of his swineherd Eumaeus. Despite Eumaeus' humble estate, the hospitable swineherd provides his guest with food, lodging, and even the cloak off his own back. Odysseus' stay with the swineherd also illustrates the ideal minimum that a stranger might expect from a Greek host.

Hospitality was taken so seriously by the Greeks because the gods themselves were thought to protect strangers. The supreme god Zeus is most often associated with guest-friendship. Homer's Odysseus warns the Cyclops Polyphemus against injuring guests because Zeus would protect strangers (*Odyssey*, 9. 270–71). In another myth Tantalus, who attempted to feed the gods with the flesh of his son Pelops, was killed for this violation of *xenia* and was condemned by Zeus to hunger and thirst perpetually in the underworld. Zeus' punishment of Tantalus is all the more poignant when we consider that some sources make him Zeus' own son. Apollodorus (3. 8. 1) preserves a similar myth about the Arcadian Lycaon. Zeus, having heard that Lycaon and his sons surpassed everyone in their pride, tested them by appearing at their home in the guise of a peasant worker. When they attempted to feed him with human flesh, he destroyed Lycaon and all of his sons (except one saved through Gaia's intervention). Even after the advent of Christianity one still finds references to Zeus as the patron of strangers in Libanius (4th century; *Declamation*, 4. 2. 9), Nonnus (5th century; *Dionysiaca*, 20. 176), and Constantine VII Porphyrogennetos (10th century; *On Virtues and Vices*, 1. 261. 29), to name a few.

As evidenced by the above-cited examples from the *Odyssey*, the importance of proper relations between host and guest is emphasized from the earliest extant Greek literature. Both of the Homeric epics have guest-friendship at their core, and established for the Greeks the ideals of *xenia*. The Trojan War, the backdrop for the *Iliad*, arises out of a violation of guest-friendship as the Trojan Paris abducts Helen, the wife of the Greek Menelaus. Legend has it that Menelaus had

entertained Paris in his home for several days before the abduction. Thus, at the heart of Paris' crime is his violation of the custom of guest-friendship (compare Aeschylus, *Agamemnon*, 399–402, 699–708; Euripides, *Trojan Women*, 865–66; Quintus Smyrnaeus, *Posthomerica*, 13. 412–14).

The *Odyssey* “may be viewed as a study in the laws of hospitality” (Pitt-Rivers, p. 13). Odysseus' son Telemachus, as he searches for his long-lost father, enjoys the hospitality of his father's war comrades Nestor and Menelaus. In contrast to his son, Odysseus, returning from the Trojan War, must overcome ogres like the inhospitable Cyclops Polyphemos, who eats several of his men. Eventually Odysseus, having lost all his ships and crew, is transported to his native land thanks to the hospitality of the Phaeacians. When he finally returns home, disguised as a beggar, he is mistreated by the suitors who hope to wed his wife Penelope and have been consuming his estate during his absence. Ultimately Odysseus sheds his beggar disguise and destroys the suitors who, like Polyphemos earlier in the poem, have clearly violated the custom of *xenia*.

Of course, the example of hospitality established in Greek myth and fiction represents an ideal. Still, sources from Greek society show reverence for the bond between host and guest, as well as a tremendous effort to accommodate strangers. In the 5th century BC the guest-friendship between the Spartan Archidamus and the Athenian Pericles led Pericles to believe that when the Spartans invaded Athenian territory Archidamus would avoid Pericles' estate (Thucydides, 2. 13. 1; Plutarch, *Pericles*, 8. 4, 33. 2). In the following century Xenophon (*Anabasis*, 3. 2. 4) complains about the treachery of the Persian satrap Tissaphernes who has violated *xenia* and complains particularly about his lack of reverence for Zeus Xenios, “Zeus, the god of hospitality”. Xenophon's *Anabasis* contains several references to various towns supplying the Greek army with oxen, sheep, barley-meal, and wine. The people of Sinope, for example, sent the army 1500 jars of wine (*Anabasis*, 6. 1. 15). From the *Anabasis* it becomes clear that the Greek army could not have accomplished their lengthy march without the hospitality of the various towns who provided them with food, drink, and other necessities. In the same century Aeschines' condemnation of Ctesiphon's arrest, torture, and execution of Anaxinus of Oreus is made all the more shocking to his Athenian audience when it is reported that Ctesiphon had formerly dined with Anaxinus in the latter's home. Accordingly, Aeschines claims that Ctesiphon murdered his host, and even claims that Ctesiphon did not deny this charge (*Against Ctesiphon*, 3. 224).

With the advent and spread of Christianity through the Hellenic world, the ideals of *xenia* established by the Homeric epics merged

with the new belief system, since the early Christian writings also embraced the ancient ideal of *xenia*. In the Gospel of Matthew (25: 34–46) Jesus praised those who would (among other things) welcome a “stranger” (*xenos*), saying that “whatever you did for one of these least brothers of mine, you did for me”. Jesus goes on to say, though, that those who did not (among other things) give a “stranger” welcome would “go off to eternal punishment”. Elsewhere in the New Testament the author of Hebrews urges the audience not to neglect hospitality (*philoxenia*), since “through it some have unwittingly entertained angels” (13: 2), an idea reminiscent of the ancient Greek stories such as that of Zeus and Lycaon mentioned above.

The Christian concern for strangers manifests itself in attempts to provide accommodation for them and the poor. In the 4th century AD Basil of Caesarea saw the value in building places for strangers to lodge (*Epistulae*, 94. 1. 36). Procopius (*Buildings*, 1. 2. 14, 17) notes that in the 6th century the emperor Justinian erected in certain cities such buildings, called *xenones* (“rooms for guests” or “rooms for strangers”), for the poor and strangers. Procopius says that the *xenones* at Byzantium were intended as temporary quarters for strangers to the imperial city who found themselves in need of accommodation (1. 11. 27). Justinian took care that similar provisions were afforded to strangers in Antioch, Ciberis, Mocusus, Jerusalem, and Jericho.

Hunting

Up to the end of the classical period hunting was pursued mainly to supplement a largely vegetarian diet and to protect flocks and homesteads against predators, chiefly wolves and jackals. Myths abound of heroes such as Heracles, Meleager, and Theseus slaying beasts that ravaged their neighbourhoods. Hunting imagery is

common in Homer, who describes Odysseus killing for the pot (*Odyssey*, 9. 154[-58; 10. 156–71). Homer's huntsmen go on foot with bow or spear, accompanied when not abroad by hounds. The quarry was chiefly deer, wild goats, and boars. The last of these must have been plentiful since the tusks of some 30 to 40 boars were required to provide the plates that gave strength to a single example of one type of Mycenaean helmet. The hunting of lions, mentioned by Homer only in similes, is uncertain, although fragments of bones have been found at Tiryns in contexts of c.1230 BC and lion hunts are depicted on a few pieces of Mycenaean art, such as late 16th-century BC bronze dagger inlaid with figures of an archer and spearmen with huge shields fighting a pride. Mycenaean bows were "self" bows (from a single stave of wood), although the composite bow, which was probably introduced in the Dark Age, was clearly known to Homer; spears were generally, if not exclusively, for thrusting rather than throwing. There is pictorial evidence for the use of nets in catching boars (although they are not mentioned in Homer's famous description at *Odyssey*, 19. 428–58), stags, and wild cattle (probably the auroch and possibly the wisent) and also for hunting from chariots (despite the unsuitability of the terrain). One fragmentary mid 13th-century fresco from Tiryns uniquely depicts huntresses amid the men.

In the Archaic age Spartans hunted game to supplement the meager diet of their common messes, while in Attica aristocratic men, as is shown principally in vase-paintings, presented younger males with live and dead game as lovers' gifts and, probably, also as tokens of their own manliness.

The principle source of information for hunting in the Classical period is Xenophon's *Cynegeticus* ("The Hunting Man"), which deals principally with nets, dogs and their training, and the hunting of hares, although deer, boar, and other large mammals are mentioned. He warns against allowing hounds to chase foxes, since this ruins them for hunting hares. Although for Xenophon its primary purpose is still for the pot, he does recommend hunting as excellent training for not only warfare, since it fosters hardiness, discipline, and initiative, but even civic responsibilities, in both of which he is supported by Plato (*Laws*, 822d–824c). Presumably for these reasons there was a law at Athens which permitted hunting through standing crops. There is evidence, however, that the development of democratic ideas, of which both Xenophon and Plato highly disapproved, had engendered an adversely critical reaction against hunting as an unnecessary aristocratic extravagance, and that the growth of population had in Attica reduced the extent of accessible terrain for the activity.

The favourite breed of hound for hunting hares (and even boars because of its superior tracking abilities) was the Laconian, of which

there were in Xenophon's day two breeds neither of which is recognizable today. The larger was perhaps 45 cm high at the shoulder with a weight of 13 to 18 kg. All hounds wore leather belts, collars, and for ease of slipping, separate leashes. The hunters, sometimes wielding curved throwing-sticks, followed most commonly on foot (for Xenophon horses were used only to get to and from the hunt). The hares, when found by the hounds and started, were caught in nets of flax. Purse nets were set in narrow defiles: the mouth was propped open by sticks which fell when the hare hit the net, whereupon the net-watcher (presumably a slave) drew tight the skirting-line. Larger road nets were stretched across paths and log nets, up to 55 m in width, in level open areas both caught hares and diverted them to the purse nets.

Deer (red, roe, and probably fallow) could be caught in nets and, in summer when they tired easily, run down by hounds before being pierced by the hunters' javelins. In spring fawns left concealed by their mothers were tracked and caught to attract hinds. Hunters also used carefully concealed foot snares. These consisted of a wooden clog attached to a noose which lay on a plaited ring of yew with inward-facing iron and wooden nails placed over a hole. The clog both hampered the deer's flight and left an easily visible trail.

The animal most prized by hunters was the boar, whose slaying without the use of nets was deemed by the Macedonians the token of manhood (the unreliable Hegesander reportedly claimed that even at the age of 35 the future king Cassander had still to sit in a chair by his father like an adolescent for his failure to accomplish the deed). Whether caught by a foot snare or driven out of a covert, the boar was a match for hounds and hunters armed with javelins and a thrusting spear especially designed with projecting teeth on the socket to prevent the beast running up the shaft.

Xenophon mentions also (*Cynegeticus*, 11) that in the Pindus range, Thrace, Mysia, and Syria "lions, leopards, lynxes, panthers, bears, and similar wild beasts" were caught by means of poisoned bait and pitfalls to which they were lured by tethered goats.

Fowling was practiced principally by professionals, who were generally despised by the literary elite. Plato considers the art unbecoming to a gentleman (*Laws*, 823e), although Xenophon is on one occasion kinder (*Cyropaedia*, 1. 6. 39). The trapping of fur-bearing animals such as otters and martens was similarly not deemed an honourable pursuit by the aristocracy, although it was quite common despite a lack of the fashionable modern sartorial relish for furs. The fowlers' main quarry was partridges, pheasants, quails, doves, and various smaller birds. Their favourite aids were purse nets, snares, and the use of glutinous birdlime (often made from mistletoe berries)

which was either smeared on the twigs of trees or on rods which could be fitted into each other to attain the desired length. Tamed females of the hunted species were employed for decoys, as were also owls since during daylight these are often mobbed by small birds. Aristotle (*Historia Animalium*, 620a33–b6) and other mention the Thracian technique of depending upon wild hawks to drive back to the ground birds started by the fowlers. A mid-2nd-century AD North African mosaic shows a fowler camouflaged by a goatskin. From close observation knowledge of the nature and habits of the animals and birds frequently hunted was extensive and extended remarkably even to leporine superfoetation (the female hare's ability to become pregnant again before the birth of an earlier set of leverets).

Although during the Classical period hunting parties had been small, Alexander's conquests enabled the Greeks of the Hellenistic period to indulge in vast hunts like the Persians, whose game parks were imitated especially in Seleucid Syria. "Hunt clubs" appeared in Macedon for upper-class males and, for the royalty of the Successor Kingdoms – in imitations of oriental predecessors – hunting tropies enhanced prestige. There is evidence too from the 3rd century BC of hunting as a form of pest-control, when, on the advice of the Delphic oracle, the inhabitants of the island of Astypalaia acquired hounds and caught within a single year over 6000 hares, descendants of two introduced from Anaphe some years before.

For the Roman period the main sources are the *Cynegeticus* of Arrian (c.AD 86–160), a section (5. 17–86) on hunting in the slightly later thematically arranged dictionary (*Onomasticon*) of Pollux and, in the early 3rd century, an often fanciful hexametric poem in four books (*Cynegetica*) falsely attributed to Oppian which mentions a huge variety of animals from the elephant and rhinoceros to the hedgehog. Arrian, writing under the pseudonym of Xenophon the Younger, is primarily concerned with updating the work of his predecessor by giving information on a Celtic breed of gazehound, probably a type of greyhound unknown to the Classical Greeks, which transformed the hunting of hares. It was now coursing on horseback rather than hunting on foot, the principal aim being the pleasure of the chase rather than the capture of the animal: indeed Arrian proposes that the hare always be given the opportunity to get clear of its form and claims (16. 5–7) to have often himself saved a hare that had run well, a point on which he specifically criticizes Xenophon, who says only (*Cynegeticus*, 5. 14) that "lovers of the chase leave the very young leverets for the goddess (Artemis)". A further innovation in hunting at this period seems to be the use of a cord with brightly coloured feathers to frighten game towards nets. The *venatio* of the amphitheatre so enjoyed by the Romans was not to Greek taste, but

hunting became a military duty both to provide wild animals for the games and to protect local livestock.

Hymnography

The history of Greek hymnography encompasses the devotional and liturgical poetry and paganism and Orthodox Christianity, as well as Byzantine parahymnography. The first examples of hymnography to survive in their entirety are the *Homeric Hymns*, hexameter compositions that were presumably sung by soloists as preludes (*prooimia*) to heroic epic. Pindar and Bacchylides were early composers of two types of choral hymns: paeans, which were sung by soldiers, in private social life and at public festivals; and processions (*prosodia*), sung a part of the pageantry that could precede a sacrifice. Examples of hymns written to accompany the sacrifices themselves survive in Hellenistic or Roman inscriptions on temple walls. Other complete and fragmentary texts from these later periods, accompanied in exceptional cases by musical notation, have been preserved in manuscripts and papyri. These range from the *Orphic Hymns* (of around the 2nd century AD) – 87 poems from Asia Minor that constitute the only surviving ancient Greek hymnal – to a papyrus fragment of the late-3rd century AD containing the first Christian hymn to have survived with its music.

With the exception of this latter composition in praise of the Holy Trinity and a few other such hymns without musical notation, it is

difficult to discern the boundaries between Christian hymnography, psalmody, scripture, and homiletics prior to the 4th century. Although scholars have found abundant hymnic material in the New Testament and deuterocanonical or apocryphal texts, they have generally been unable to identify its provenance or liturgical use. The highly poetic Ester homily of Bishop Melito of Sardis (2nd century), which some have seen as a precursor to the works of Ephraim the Syrian and Romanos the Melodist, may similarly contain echoes of contemporary hymnody. Two hymns by Clement of Alexandria, on the other hand, are probably non-liturgical compositions.

Following the legalization of Christianity, the pressures of pervasive heresy and large numbers of new converts led the Church to regulate its worship by defining a canon of scripture, assigning the performance of chants to ordained specialists, and suppressing all but the most venerable *idiotikous psalmous* (“private psalms”). As a result, only a few ancient hymns – for example, the *Phos Hilaron* for evening prayer – remained in services that were coalescing around presidential prayers and biblical psalmody, the singing of which had recently been popularized by the ascetics of the Egyptian desert. Unlike the monks, who would recite the Psalter as a contemplative exercise, urban Christians chanted select psalms or canticles with newly composed refrains. Those of one sentence or more were called *troparia*, examples of which include the *Trisagion Hymn* and “Only Begotten Son”, a summary of the Nicene Creed attributed to Justinian.

Identity

The centrality of language is indubitable. Some signs specific to the Linear B syllabary on a circular pebble excavated in a Middle Helladic context indicate that Greek was being written in the Peloponnese around 1650 BC. We do not, however, know what those who then spoke the language called it. The Homeric epics (of the 8th century BC, but incorporating much earlier traditional phraseology) use “Achaioi” as the main generic name with “Danaoi” and “Argeioi” as alternatives. Hittite tablets of the 2nd millennium BC mention “Achiyava” as an important kingdom while Egyptian inscriptions name the “Danaya”. None of the three terms was used as an overall self-description by speakers of Greek after Homer. “Argives” and “Achaeans” became confined to subgroups.

The peoples to their east called Greek-speakers by some variant of “Ionians”, because Ionians from Euboea, the Aegean islands, and the Asia Minor coast dominated trade there into the 7th century BC. Greek-speakers themselves, however, saw the Ionians rather as one of their main subdivisions. The fragmentary pseudo-Hesiodic *Catalogue of Women* of the 6th century BC presents a genealogy in which they are somewhat closer to the Achaeans, Ion being brother to Achaeus and son to Xuthus, than to Aeolus and Dorus, Hellen’s other two sons.

Peoples to the west and the north of the Greek-speakers took the word “Greek” from the Romans. The reason for this choice is uncertain. The *Catalogue of Women* states that Zeus and the daughter of the first man, Deucalion, gave birth to Graecus, and later sources that Hellen, Deucalion’s son, gave his name to the people previously called “Graikoi”. Since no major subdivision of Greek-speakers called themselves “Graikoi”, it is conceivable that what we find here is the echo of an earlier attempt to construct a common genealogy, current when cities of Euboea and the town of Graia (Oropus) opposite were founding the first Greek settlements in Italy.

Neither “Achaean” nor “Ionian” nor “Greek” became the dominant term of self-descriptive identity in Classical antiquity. In Homer “Hellene” referred only to Achilles’ kingdom in south Thessaly or Phthiotis (*Iliad*, 2. 680–85). In the 7th century BC, however, Hesiod (*Works and Days*, 1. 653) speaks of all the mainland Greeks as “Hellenes”. By the 6th century BC a common shrine of nine cities at Naucratis in Egypt was called the “Hellenion” (Herodotus 2. 178), while “Hellanodikai” was the name of the judges in Olympia.

The Greek-speaking world was composed of a large number of often fiercely competing city states, and, at its periphery, also some more traditional kingdoms. Thus Hellenic identity, in contrast to many others, was not based on a common political loyalty. Herodotus (8. 144) puts in the mouth of the Athenians a catalogue of what made the Hellenes one people – common blood, common language, common temples and sacrifices, and a common way of life. Since the word used for a non-Greek, “barbarian”, originally meant “heterophone” (Homer, *Iliad*, 2. 867 uses “barbarophones” to describe the Carians as “of foreign speech”), language was almost certainly the most important of these. The common genealogies already referred to, the common cult centres and sacrifices associated with the Homeric pantheon, and a common way of life were indeed crucial elements in ancient Hellenic identity. Common political institutions and loyalty are not even mentioned.

What constituted the common way of life? For most Hellenes it was life in a city state, which gave citizens then-sense of political identity and privilege in relation to slaves or serfs. For all, it was the values instilled by the Homeric epics: on the one hand, a close family at home, as witnessed by the *Odyssey*, a safe haven after long periods of absence, especially at sea; on the other, an agonistic or competitive approach to life in society, whether in war, debate, or athletic games, as witnessed by the *Iliad*. Homer was central to ancient Greek education. The spread of many Homeric values to non-aristocrats helped set off major political experiments and encouraged individual achievement among thinkers, craftsmen, and artists alike.

The word “barbarian” is never used in Homer of non-Greeks as a whole. Nor is moral superiority ascribed to the Achaeans compared with the Trojans. After the Persian Wars, especially in Athenian drama (starting with Aeschylus’ *Persae* in 472 BC) and Herodotus, there is a clear sense of superiority based on forms of political organization and military and cultural achievement, the first sure instance in which Hellenic identity is partly defined by opposition. Herodotus (1. 1) states that he wrote so that “the great and marvellous deeds performed, whether by Greeks or by barbarians, should not lose their renown”. From the following chapters it is clear that he saw Persians, Phoenicians, Egyptians, and Lydians as cultured and clearly differentiated, yet equally “barbarians”.

Although the Persian invasion (480–479 BC), resisted by a voluntary alliance of about 30 city states, proved a defining moment, consensual political unification of all the Hellenes did not follow. In the late 4th century BC Philip and Alexander of Macedon, masters of a kingdom dismissed by Hellenic political opponents as “barbarian”, justified the imposition of an alliance as a means to obtain revenge against Persia,

but this unity too did not survive Alexander's death.

Alexander's conquests (336–323 BC) formed another defining moment. Hellenes poured eastwards bearing their cultural values such as city life, athletics, philosophy, and art. Large numbers of non-Hellenes began to use Greek as a second language. This brought changes to the language, and loosened the connection of its use with Hellenic identity. Earlier in the 4th century BC Isocrates (*Panegyricus* 50) had already advocated that the name "Hellenes" should be applied to those who shared Hellenic culture, rather than ancestry. By contrast, the other two of Herodotus' defining characteristics, a shared way of life and religion, became more important in a cosmopolitan and linguistically united world.

Political fragmentation assisted the Roman conquest, but Roman rule did not diminish the sense of a separate Hellenic identity for several centuries. The Classical revivalists of the 2nd century AD, though content to be part of the empire, were proud to be culturally Hellenes and politically citizens of their particular cities (no longer effectively "states").

Writing to the Corinthians (1 Corinthians 1:18–25) Paul contrasts Jews and Hellenes as two peoples and outlooks from either of which one might come to the Christian faith. What ultimately occurred was more radical. A people noted for its cultural self-confidence and pride in superiority over barbarians came to adopt as its own the empire of one foreign people, the Romans, and the religion, albeit universalized, of another the Jews. The history of Greek-speakers continued under the mantle of the Romaic empire and as a new Israel.

From the 3rd century AD onwards, the growth in transcendental religion and the gradual decline of cities in an increasingly beleaguered empire led to changes first in the content and then in the self-descriptive aspects of identity. Thus by the 6th century "Hellenes" had come to mean "pagans", actively opposed by Christians. Meanwhile in a significant popular phrase one city alone, Constantinople, came to be known as "the City", mirroring the fact that loyalty was now focused on a single state, the empire of the Romaioi, "Romans" in Greek. Thus two crucial elements of later Greek identity, the Romaic and the Orthodox Christian, enter the scene, not however in their narrower contemporary sense. They were originally, both in principle and in practice, much broader than the Hellenic identity had been, spreading far beyond speakers of a particular language, aspiring indeed to universality.

If the self-descriptive elements of identity changed, there was considerable continuity in content: first, in language, second, in respect for some ancient cultural values, and third, in continued distaste for barbarians. There were several revivals of Attic Greek (as

in the 2nd, 4th, and 9th centuries). More important was the influence of the Septuagint translation of the Old Testament and the original Greek text of the New Testament, which, with the hymnody of the Eastern Church they inspired, had a simultaneously conserving and formative effect on Greek, comparable to that of Luther's translation of the Bible on German and the Authorized Version on English. Equally, there was continuing respect for Classical culture among the educated. Quite as important were folk memories (e.g. of Alexander), traditions, and values among the less educated, including the continued insistence on excellence, for example, in craftsmanship. The "barbarians", who were effectively reducing the area of Greek cultural and linguistic influence, were more dangerous than ever. They were now distinguished less by language and more by their uncultured, destructive, and (in the modern sense) barbarous behaviour.

Illyrians

Tribes settled on the northern and eastern shores of the Adriatic

The region where the Illyrians were established is known as Illyria, extending from Epirus in the south to the Danube in the north and as far as the river Morava in the east. The boundaries, however, of the territory of the Illyrians are not clearly defined and little can be learnt from written sources about their origin and culture. Since the Illyrians themselves did not leave any written evidence of their past, information is based on the texts of Greek and Roman authors who referred to these tribes as "barbarian"; the Greeks identified the Illyrians as an *ethnos* (race) different from the Macedonians, Thracians, and themselves. The personal and geographical names

appearing in Greek and Latin records and inscriptions contribute to a partial reconstruction of the Illyrian language. It can therefore be deduced that the Illyrians spoke Indo-European dialects. According to a Greek legend, Illyrios was the son of Phoenician Cadmus and Harmonia, who settled in Illyria, and became the ancestor of the Illyrian people. Recent research has demonstrated that the Illyrians comprised a mixture of ethnic groups who did not necessarily have identical origins. Their formation coincides with the beginning of the Iron Age, around 1000 BC.

The Illyrians came in contact with the Greek Aegean at an early date. Excavation finds from the 8th-century BC cemetery at Vergina indicate a temporary Illyrian presence in ancient Macedonia, especially in its northern and western areas. At the same time, Greeks were attracted to Illyrian territory; the silver mines of the region, located inland – e.g. Damastion – increased their interest. Archaeological finds indicate that Greek imported goods, primarily pottery and metalwork, reached the Illyrians who inhabited the Adriatic littoral as early as the 8th and 7th centuries BC. The first Greek cities were established along the Adriatic coast in the late 7th and early 6th centuries BC. By 627 BC a joint expedition from Corinth and Corfu founded the colony at Epidamnus, and around 588 BC another at Apollonia; both became important centres of trade. Thus, the sea crossing to south Italy passed under Greek control and these two ports remained for many centuries the termini of the route across the southern Balkans. Excavations of the early cemeteries of Epidamnus and Apollonia have brought to light numerous examples of Corinthian pottery as well as local Illyrian products. Although Greeks traded in the region north of the river Drin, they did not establish any settlements either on the coast or inland. Three Greek colonies were however founded on the islands of Black Corcyra (Korcula), Issa (Vis), and Pharos (Hvar), by Cnidians, Parians, and Syracusans respectively. The trade which developed between these Greek colonies and the Illyrians contributed significantly to the latter's development and closer contact with Greek culture.

Illyrians made their appearance in Greek affairs in 424 BC. At this time Brasidas and his Spartan army were in Macedonia to assist king Perdiccas and other opponents of Athens to attack the Athenian colonies in Thrace. The Spartans did not at first become involved in Macedon's war with Arrhabaeus, ruler of Lyncus (who was not an ally of Athens but an independent ruler), but following a Macedonian victory they were persuaded to await the arrival of the Illyrian mercenaries who came to join Arrhabaeus. In 423 BC the joint expedition of Macedonians and Spartans ended in retreat because they feared the warlike Illyrians.

The history of the Macedonian kings is marked by a succession of wars against the Illyrian tribes which ended with Roman intervention in the 3rd century BC. The migration of the Celts at the beginning of the 4th century BC disturbed the territory between the Danube and the Adriatic and forced the Illyrians southwards. Consequently, the need for defence united them under Bardylis around 383 BC. The Illyrian attacks on Macedonia brought the latter close to collapse. King Amyntas II and, later, Perdiccas were defeated and the latter was slain (359 BC). It was only in Philip II's reign that the Illyrians were completely crushed and part of their territory was annexed to Macedonia. The Illyrians attacked Macedonia again in Alexander's time, but they were defeated. In the reign of Cassander an Illyrian tribe, the Taulantii, became involved in the struggle between Epirus and Macedonia, offering asylum to the infant Pyrrhus after the expulsion of his father Aeacides from his kingdom among the Molossians. When Pyrrhus became king of Epirus, he strengthened his links with the Illyrian tribes by marriage alliances.

The wars with Macedonia and Epirus brought the Adriatic Illyrians into contact with the Greek world. Major changes in the social and economic life of south Illyria occurred before the end of the 5th century BC, while in the north similar changes appeared a century later. The urbanization which followed the growth of towns – the first fortifications were built in the 5th century BC at Gajtan – altered the tribal structures and created a demand for greater political autonomy. The first public buildings were not constructed however until around the middle of the 3rd century BC at Byllis.

An Illyrian kingdom was established in the 3rd century BC with its capital at Scodra. The dynasty of the Antigonids in Macedonia was often distracted from its attempt to retain power in Greece by Illyrians, especially the Dardani, on the northern frontier. At the same time, a new power, the Ardiaei, who inhabited the south coast of the Adriatic, emerged among the Illyrians. Responding to the request of Demetrius II of Macedonia, the Ardiaei and their king Agron helped Macedon's allies, the Acarnanians, against the Aetolians in the siege of Medion (231 BC). After Agron's death, the command passed to his widow Teuta and the Illyrians engaged in piracy, ravaging the shores of Greece and Italy. The Greeks turned to Rome for help. The two Illyrian wars with Rome (229 and 219 BC) ended with the submission of the Illyrians and the annexation of part of their territory by the Romans.

Imperial Cult

The imperial cult almost certainly owes at least part of its acceptance during the Roman empire to the establishment of ruler cults in the late Classical and Hellenistic periods. Although a divine cult for a living person was against Greek tradition, the Spartan commander Lysander had received a cult on Samos after the Peloponnesian War. Only scanty evidence exists for other divine cults to individuals in the 4th century BC before the time of Philip II of Macedon and Alexander the Great. Whether Philip received a cult during his lifetime is debated, but his son certainly did: his personality, conquests, and unlimited power had elevated him to an unprecedented status that demanded special recognition.

Alexander's successors not only bolstered his worship, but were often granted their own ruler cults. The reasons for this were largely due to the community's need to acknowledge the rulers and their families as individuals of immense power and wealth who excelled all others in their benefactions; the cults were an assertion of the rulers' unique abilities to aid their communities. Some rulers, such as the Ptolemies at Alexandria, also established their own dynastic cults to celebrate their families, but these cults rarely lasted very long.

The creation of a Hellenistic ruler cult involved the construction of a temple or shrine only occasionally (about a dozen are known). Far more common were awards of an altar, priest, sacrifices, games, and statues. Statues of the ruler might even be placed in existing temples of traditional deities, where the ruler would "share" the space, honours, and even qualities of that deity.

The purpose of these cults is still debated: were they religious or political in nature? To deny one in favour of the other is difficult, because politics and religion were very closely entwined in antiquity. What is certain is that the people who founded and managed the cults were creating a new reality in which the immense power and influence of the rulers, who now directly affected life in the Hellenistic world, were given prominent recognition.

The imperial cult was not merely a simple continuation of the Hellenistic ruler cult but was, nevertheless, partially inspired by it. A divine cult to a living Roman became part of Italian culture only

through contact with Greek cities. Marcus Claudius Marcellus, who sacked Syracuse (212/11 BC), and Titus Quinctius Flaminius, the liberator of Greece (196 BC), both received divine honours. Yet the practice became more common only a century later as other individuals, Greeks and Romans, were given cults in recognition of their benefactions to communities.

The almost simultaneous adoption of the cult of Roma (the power of Rome) in Greek cities from the early 2nd century BC reflected another aspect of the growth of Roman influence in the east. Much more widespread than the earlier ruler cults, the cults associated with Rome mirrored the development and spread of Roman power; they represented an acknowledgement of that power by the Greeks.

The preeminence of deified Julius Caesar and his adopted son Octavian/Augustus altered the practice of these cults in the east. Augustus was praised as the greatest of all benefactors and saviours in the east, because of the peace attributed to him after the defeat of Antony and Cleopatra. So great was his reputation that, before the end of his life, divine cults to non-imperial family members were no longer being created. The omnipotence of the emperor had been recognized by the eastern communities.

In addition to the hundreds of municipal and private household cults established to celebrate the emperors and their families, eastern provincial assemblies were also given permission to create cults. Emperors were always careful to avoid official deification at Rome itself during their lifetimes (with the exception of Caligula and Commodus), officially becoming deities only upon their apotheosis after death. In the provinces, however, they permitted their worship in conjunction with Roma, other imperial family members, and, eventually, among the cult of previously deified emperors and among the established Olympic pantheon. The practice began in 29 BC, when Octavian had given, at the request of the provinces of Asia and Bithynia, permission for temples to be dedicated to Roma and Divus Julius Caesar at Ephesus and Nicaea, and to Roma and Octavian at Pergamum and Nicomedia. Tiberius, the next emperor, refused a request for his cult from Baetica but granted it to Smyrna where the temple was dedicated to him, Livia (his mother and the wife of Augustus), and the Senate. Emperors did have separate temples to themselves, but they commonly shared the honour with others.

Possession of a provincial cult was so prestigious that cities vied with one another for the honour, which, once given, was advertised in the official title of the city. Grants of these cults were quite rare, making them even more desirable considering the economic and political benefits that accrued to them. The members of the provincial elite who managed the cult also benefited: their status within the

community and empire increased. Association with these cults was a statement that they and their families accepted the Roman system and hoped to benefit from it.

Imperial cults could be housed in a variety of types of structures, simple to very grand. Existing buildings, such as stoas and gymnasia, were modified to accommodate the cult; others, such as bath buildings, were constructed with special rooms. Unlike the earlier Hellenistic ruler cults, however, many more elaborate complexes were created for imperial ritual. A Caesareum or Sebasteum, the names sometimes used for these special sanctuaries, had no absolute model but might include a temple, altar, and statues among its other features.

The imperial cult was regarded by some in antiquity merely as a form of flattery (Tacitus, *Annals*, 6. 18). Its religious and political importance to the empire is still debated. The ritual probably did help to bring Greek and Roman together, but whether it created any sense of loyalty or instilled devotion among the inhabitants of the empire is difficult to say. Whether the emperor was regarded as a truly divine being is undeterminable; many of the poor and uneducated may have believed so. Yet, since the imperial cult was rarely imposed by the emperor or his court, most will agree that this indicates a willingness on the part of the Greeks to accept the new conditions that accompanied the control of their lands by Rome. The celebration of the imperial cult was an expression of gratitude for the benefactions received or ones that might come in the future. It does not prove or even indicate any real piety towards the emperor. The establishment of Christianity in the 4th century ended the practice.

Imperialism

Most wars in ancient Greece not fought to gain independence were, as elsewhere, motivated by either the fear or hope of plunder, economic exploitation, or outright annexation. All self-governing Greek states were at all times in some form of military preparedness, if not, as was very frequently the case, actually at war. War, like slavery, which it often facilitated, was so common as rarely to provoke questioning of its morality: whether a Greek was or became free or slave was a quotidian accident of the human condition. The Greeks' love of freedom sprang from a fervid desire to have complete control over their own destinies, a desire that did not question the right to control the destinies of others; and in confirmation of this, Greek gods of war were deemed far more powerful than any god of peace. As Thucydides makes Athenians inform the Spartans, "it has always been an established rule that the weaker are kept down by the stronger" (1. 76. 2), while Aristotle adds to preservation of one's own liberty and hegemony over one's subjects as legitimate aims of war "the exercising of the role of master over those who deserve to be slaves" (*Politics*, 1334a2). Thus the continual imperialist bullying by even small states of each other is the very warp of the tapestry of Greek history; and any alliances were inexorably doomed to ephemerality or

continuous internal dissension.

The earliest form of Greek imperialism was the *synoikismos* (literally “living together”) of the Dark Age, the process by which the polis, or city state, emerged; but the extent to which surrounding communities joined the dominant city voluntarily or under coercion is usually unknown: presumably it varied. In most of these city states equal citizenship was enjoyed by all members. Sparta, however, which became by far the largest city state and had by the end of the 8th century BC conquered Laconia and most of Messenia, was governed by an elite group of Dorians who reduced the mass of the inhabitants (the *perioikoi*, literally “those who live in the surrounding area”) to second-class status or collectively owned helotry. Although this policy was not unique to the Spartans, the scale on which they applied it necessitated the reorganization of the elite as a permanent standing army for internal protection (the Lycurgan reforms), which in turn excited further, though often unsuccessful, imperialist adventures in the northern Peloponnese, central and northern Greece, Asia Minor, and even Sicily.

Colonization, which occurred chiefly in the period c.750– c.550 BC, was driven largely through internal pressures rather than imperialist desires, since most colonies were completely self-governing, though retaining religious, cultural, and commercial links with the *metropolis* (mother city). Nevertheless, they were planted, sometimes peaceably and sometimes by force of arms, on the littoral of the Mediterranean from northeastern Spain, southern France, and southern Italy and Sicily to Libya and what is now southern Turkey and on the eastern and southern shores of the Black Sea. They remained essentially Greek, although there was some acculturation of neighbouring peoples, and many had a long history, some in Asia Minor and Pontus enduring until 1922. In the second half of the 6th century BC the settlers in Asia Minor became the first Greeks to experience foreign imperialism when, having survived the harassment of an expansionist Lydia, they succumbed to the Achaemenid Persian empire, which did, however, practise religious tolerance and generally appointed Greeks as satraps under the watchful eye of officials of the Great King. It was mainland Greek help in the uprising of these cities which led to the Persian Wars of 490–479 BC and the subsequent Athenian attempt at hegemony.

The Delian League (a modern term) was formed in 478 BC to defend Greek states against further Persian reprisals, but its leader, Athens, clearly had imperialist ambitions from the beginning when it forcefully coerced Eion to join. Athens’ attempt, despite some federalist elements in the city, to establish for its own economic benefit a rival to the Spartan-led Peloponnesian League is dear from

actions such as the reduction of Thasos, which attempted to secede in c.465–462 BC, the transfer of the treasury from Delos to Athens in 454 and the gradual substitution of monetary “tribute” for supplies of ships, the imposition of a huge indemnity on Samos for defiance in 440 BC, and the killing of all adult male citizens and enslavement of the rest of the island’s population when Melos refused to join in 416 BC.

The first half of the 4th century BC was marked by various short-lived imperialist attempts by, for instance, Thebes and, in Thessaly, Jason of Pherae; but it was Philip II of Macedon who, having first brought his semi-autonomous barons to obedience and established a standing army, successfully extended his rule over all Greek mainland states except Sparta. Panhellenism, a movement to unite all Greeks against Persian threat, which had been preached by men such as the Athenian Isocrates, played a part in his ambition to invade the Persian empire, but his death in 336 BC left its execution to his son Alexander III. Despite some contemporary propaganda and the romantic view of universal brotherhood held by some modern scholars, the megalomaniacal Alexander was activated by an insatiable lust for conquest which was terminated only by his soldiers’ refusal to continue and his own subsequent death. He made little attempt to organize the vast swathe of territory which he had overrun, his policy of forcing Macedonian officers to marry Persian women being driven principally by an infatuation with the charms of Persian imperial trappings and the desire to create an elite neither Macedonian nor Persian with loyalties to himself alone. His conquests did, notwithstanding, have the enormous consequence of spreading a veneer of Greek culture over the Near East and establishing a simplified form of the language as the *lingua franca* (as evidenced in the New Testament), a legacy which survived the area’s incorporation into the Roman empire.

Alexander’s failure to nominate an heir ensured the immediate fracturing of his empire, ‘which fell into three main successor states: one (Antigonid) mainly in Macedon and Greece; one (Seleucid) stretching from Anatolia to, initially, Central Asia; and one (Ptolemaic) based upon Alexander’s eponymous city in Egypt, which, despite its Macedonian rulers, replaced Athens as the principal centre of Greek culture. Greek imperialism was now exercised by individual rulers attempting to expand their personal empires at their rivals’ expense. In the 2nd century BC some small breakaway Greek states invited the Romans to aid them resist reabsorption, but the continuing threats from Macedon and the Seleucids and even quarrels among the smaller states themselves induced the Romans eventually to abandon their policing of Greece and embrace it within their own growing

empire. Apart from the destruction of Corinth in 146 BC Roman rule in Greek lands was remarkably lenient. The Roman attitude towards their inhabitants was contempt for their moral laxity, fractiousness, and military inferiority mingled with an admiration for their culture so strong that the poet Horace admitted (*Epistles* 2. 1. 156) that the captive held its captor captive, while upper-class Romans communicated with each other in Greek by preference.

It may be argued that Greeks were involved in the creation of the Roman empire, since its first province, Sicily, was created in 241 BC at least in part to facilitate the Romans' protection of the Greek colonies there against Carthaginian attacks. Moreover, the traditional Roman fetial (priestly) prohibition of the "unjust" war was in theory strengthened (though in practice weakened) by the influence of Greek Stoicism after the Rhodian Panaetius (an intimate of Scipio the Younger and the most important political figure in mid-2nd-century BC Rome) rejected the excesses of Stoic exclusivity and made Stoic philosophy amenable to generals and statesmen. Thus any non-civil Roman war became "just", since it potentially brought the benefits of a superior Roman civilization to the benighted nations of the world and legitimized the elimination of any rulers who opposed conquest. In Virgil's memorable words, Rome's mission became "to spare the down-trodden and vanquish the proud" (*Aeneid*, 6. 853). The process of imperial territorial acquisition and human absorption into the state reached its natural conclusion in an edict of Caracalla (the Antonine Constitution), which gave citizenship (although most of its advantages had by then been abolished) to virtually all free members of the empire probably in AD 212.

Inheritance

The transfer of property upon the death of the owner is known as inheritance, and almost every country has special laws that regulate the disposition of private property after the owner's death by naming the relatives or other persons who have first rights of inheritance. It is also permitted to transfer property to persons other than those specified by law by means of a will (the legal instrument that embodies the owner's ability to dispose freely of his or her property posthumously), and rules for making such wills are also set by inheritance law. The person who inherits or who is entitled by law to inherit property after the death of its owner is known as an heir, while the dead owner is called the decedent. Upon the death of a person, the title to all the property, both personal and real, must pass to someone. If there is a valid will, property usually passes to the legatees, i.e. the persons directed by the decedent. In the absence of a valid will, the decedent is said to have died intestate, and the law must then decide who the valid heirs are, and the order and proportion by which they inherit. This is done according to statutes known as intestacy laws. Strictly speaking, an heir is a recipient of money or property left by someone who died intestate, whereas the beneficiary of a will is technically known as a legatee or devisee. But in common usage "heir" refers to anyone awarded an estate, whether or not the deceased person left a will.

In ancient Greece, where our evidence comes chiefly from Athens and the Cretan city of Gortyn, intestate succession was favoured. Wills, which were normally written and witnessed, were allowed only when the testator had no sons. First in order of succession came the dead person's sons and male descendants. Thus, if a deceased man left legitimate sons, they shared the property equally, the eldest getting no more than the others. The western medieval right of primogeniture – according to which land devolved automatically on the eldest legitimate son – had no place in Greek society. If a son died before his

father and left sons of his own, then those sons inherited their father's share. If there were no sons or male descendants, the inheritance passed to the decedent's brothers and male descendants, and in the third place to the sons of the decedent's grandfather and their male descendants. Ascendants were excluded if their descendants were alive: the father did not inherit if a brother of the deceased was alive; nor did the grandfather, if an uncle was alive. No distinction was made between natural and adopted sons; but children born out of wedlock were illegitimate, and had no claim on the father's estate. During the Byzantine period, however, all natural persons (i.e. blood descendants, including slaves, minors, and the unborn) could inherit, as also could corporate bodies, communities, the Church, or pious foundations. Christianity, in fact, encouraged donations at death to churches and monasteries as well as the distribution of part of the inheritance among the poor. Moreover, under Byzantine rulers, the state demanded part of the inheritance in the form of voluntary grants or as a mandatory obligation. However, the right of individuals to inherit was diminished or even precluded by a set of punishable offences and other factors: heretics, apostates, and even children of a mixed marriage with a heretic were excluded from succession while manumitted slaves might receive only the so-called *legata* (special legacies). There were also restrictions regarding the inheritance of certain specific types of property: *stratiotika ktemata* (military goods), for example, could be inherited only by those capable of fulfilling military service (perhaps a similar objective was achieved by the Homeric heroes through prizes given at funeral games, cf. *Iliad*, 23). Although slaves could inherit under the Byzantine empire, they were not given the right to transfer property upon death. However, wills of women and monks are known and *paroikoi* (tenants) were entitled to transfer their lands to heirs, though probably only with the approval of their lords.

In Classical Athens the claims of sons and male descendants could not be set aside by testamentary dispositions. Males generally excluded females in the same group of kinship. Only in the absence of sons or male descendants of predeceased sons could a daughter inherit. She was obliged to marry the man to whom her father had destined her either when he was alive or by a will. Failing such disposition, the daughter could be claimed by the next collateral together with her father's fortune. But if a son remained, the daughter had no right to succeed and could demand only a dowry, to be determined at the discretion of her brother. If she was divorced or was childless after marriage, the dowry went back to the heirs, i.e. the male descendants. If the decedent left a daughter but no son, and if the daughter had a son, he would inherit. But as long as she was

without a son, she was *epikleros*, i.e. a sort of “heiress”, who could be claimed in marriage by her nearest male relative who took charge of the property until their son was old enough to take it over. One must not, however, conclude from this that women in Greek cities could not inherit. Literary and epigraphical sources, from Athens, Gortyn, Naupactus, and Thermus in Aetolia, of the 5th–3rd centuries BC, suggest that women did inherit, in a succession order of varying complexity in different states. In the absence of legitimate children, the inheritance could be claimed by relatives within the *anchisteia* (close kin). It was in effect possible for a man without sons to choose an heir by adoption and thus ensure the continuance of his family and the religious worship connected with it. The adoptee became legally the son of the adopter and so inherited the property, but could not oust an *epikleros*; he might marry her himself (in which case the chief share of the inheritance would fall to this married daughter and her husband, while any other daughters would be given dowries), but anyway her son inherited eventually. If a son had not been adopted, and there were only daughters surviving, the succession passed to them. In such a case the next of kin had a legal right to one of the heiresses, and could claim to marry her even if she had married someone else before receiving the inheritance. On the other hand, poor heiresses had a legal claim on their nearest of kin either for marriage or for a provision suitable to their circumstance. A man who married an heiress was bound by custom and tradition, if he had sons, to name one as heir to the property that had come with his wife, and thus to restore the house.

According to tradition, it was Solon (c.640–560 BC) who introduced wills to Attic law. Previously, the estate of a childless man had gone to his clan. Because it gave one the power to dispose of property after death, the right to make a will was a recognition of the right of private property rather than of family, clan, or tribal ownership. We have surviving accounts of the wills of some well-known personages of antiquity. Aristotle was generous in providing for his family and friends, while Epicurus willed his property to the school hoping “that all those who study philosophy may never be in want ... so far as our power to prevent it may extend” (Diogenes Laertius, 10). According to his first speech *Against Aphobus* (no. 27), Demosthenes’ father left in trust for him an estate worth about 14 talents, including two small businesses in cutlery and furniture. The Athenian banker Pasion in his will appointed his former slave Phormio as guardian for his younger son, entrusting him with the management of the bank until the boy should come of age; he also stipulated that Phormio should marry his widow (Demosthenes, 36). Some of the purposes of a will had been achieved by resorting to adoptions, which continued to be common

and were treated to some extent like wills. But the will took effect only on the testator's death. No formality was needed for legitimate sons to take possession of the inheritance, and they had no right to refuse it. Other relatives, however, needed an official authorization. If a man died intestate, leaving neither descendants nor adopted sons, the inheritance fell to his nearest relations in the male line and, in default of these, to those in the female line as far as children of first cousins. It was also possible to resort to posthumous adoption by which relatives arranged for one of themselves to become legally the deceased man's son. Disinheriting, however, was possible only in the father's lifetime by solemn declaration. It was not possible to disinherit legitimate children by means of a will or adoption.

At Athens anyone who thought that he had a legal claim to an inheritance made an application to the archon to hand it over to him. This application was displayed in public and read out in the following assembly. The question was then asked whether anyone disputed the claim or raised a counterclaim. If not, the archon assigned the inheritance to the claimant; otherwise the matter was decided by a lawsuit. Even an inheritance once assigned might be disputed in the lifetime of the holder and for five years after his death. The same procedure was followed regarding the claim of the nearest relation to an heiress. The Athenian orator/speech-writer Isaeus (c.420–c.350 BC) appears to have specialized in cases of inheritance. Of some 50 speeches with which he was credited, the 11 that have survived in entirety all deal with cases of inheritance and are important as illustrations of Athenian testamentary law.

According to the Gortyn law code (12 columns of laws engraved on the interior wall of a former courthouse and attributed to the 5th century BC), the property was shared by the sons and daughters, but a son got twice as much as a daughter, as happens *de jure* among the Muslims (cf. Qur'an 4: 2 and 34). A daughter without brothers was called *patroiochos* and her rights were generally similar to those of the *epikleros* at Athens, although there were differences of detail.

Both forms of transferring property – through a will and through intestate succession – were recognized in the Byzantine empire. It was also possible to enter into an informal agreement when a dowry was promised for a marriage contract, so that these agreements assume the character of both marriage and inheritance contracts. By the time of the code of Justinian (ad 529), Roman law recognized many types of wills, including oral wills declared in the presence of seven witnesses or before a public official. But for the Byzantines, the will represented only one of many dispositions that a living person could make in view of his death. On the one hand, for a will to be valid, it was not necessary for an heir to have been appointed and, on the other hand,

it was possible to make *legata*, *fideicommissa* (bequests in trust), donations in view of death, to pious foundations, distributions of money for the good of the soul (*psychika*), and similar arrangements independently without being part of a formal will.

The heir entered into the legal position of the deceased and therefore became responsible for the obligations of the testator just as he, in his turn, could put forward the claims of the testator. The heir was also considered a debtor of the legacies bequeathed by the testator. To keep the heir's own property from being liable for the debts of the deceased, it became the practice from the time of Justinian I to establish an inventory documenting the size of the inheritance. A limitation on the responsibility of the heir for paying the bequests made by the testator was guaranteed by the Falcidian Law of 40 BC.

Inscriptions

Inscriptions can be taken to refer to objects made of different materials – e.g. pottery, clay tablets, metal, and most usually stone – on which letters have been carved, drawn, or painted. The study of inscriptions (epigraphy) usually focuses on inscribed stone or metal objects. In this article some mention will be made of inscriptions on pottery, clay tablets, and coins, but the focus will be on stone and metal inscriptions.

Inscriptions provide the cultural historian of the Hellenic tradition with a wealth of ideas and information about the past and the ways in

which the people of the past presented themselves. Inscriptions are more familiar to the historians of the Graeco-Roman world, but inscribed material from the Byzantine, Frankish, and Ottoman eras is also known.

Some students of history still make the mistake of thinking that epigraphic evidence has a greater value than other forms of evidence because of its often more durable nature. Inscriptions, like much historical evidence, have been produced in a temporal and spatial context often with a self-conscious appreciation of meaning and function. The evidence of inscriptions is therefore laden with difficulties of interpretation, in addition to the fact that not all the material that was inscribed has survived or been discovered. Further, not all areas of Greece or Greek communities inscribed; nor did all Greek communities inscribe all the time. These phenomena can be summarized by the term “epi-graphic habit”. Of all ancient societies, the Greeks were among the most advanced in terms of their epigraphic habit; and of the Greeks, the Athenians provide the most extreme example of display through inscriptions. Greek inscriptions are one index of the diffusion of Greek culture, and their distribution reaches far beyond the shores of the Mediterranean: Greek inscriptions and organized modern collections of ancient material appear in Bulgaria, Romania, and southern Russia; a large body of evidence exists in the Near East, along the African coast, particularly in Egypt and Cyrene. Greek inscriptions appear all over the Graeco-Roman world, thereby illustrating the importance of the Greek language for the development of Western culture.

But in many communities inscriptions were made not only in the Greek alphabet. From some periods and some regions a combination of languages have survived on some inscriptions. The Letoön trilingual is an inscription which provides a parallel text in Aramaic, Greek, and Lycian (Davies, 1983, pp 244–45). In many areas during the Roman period, bilingual Greek–Latin inscriptions were made, the *Res Gestae* of Augustus being perhaps the best-known example (Brunt and Moore, 1967). From the Classical and Hellenistic periods, numerous bilingual inscriptions in Greek and Phoenician have survived, especially on Delos, on Cyprus, and at Athens.

Greek inscriptions first appeared in the Archaic period; the earliest known examples are scratched or painted on pottery and date to the second half of the 8th century BC. Their appearance touches on the related question of the introduction of the Greek alphabet. Modern understanding of the introduction and development of the Greek alphabet is heavily dependent on inscriptions. Of the inscriptions which survive from the archaic period, many examples exhibit a significant difference both in regional dialects and in local letter styles

(Jeffrey, 1961).

Although very few of the early inscriptions amount to lengthy texts, the majority are dedications, brief commemorative statements, often in a funerary context. An inscribed bronze helmet dedicated by the Syracusans to Zeus at Olympia is an offering made from the spoils of a victory over the Etruscans by Hieron after a battle at Cumae (Fornara, 1977, no. 64A). According to Diodorus Siculus (11. 51), the successful naval battle was fought in 474 BC. The first lengthy inscriptions survive from the 6th century BC. Among the best known are the legal texts from Crete and in particular the great code from Gortyn which gives vital details about the organization of the Dorian community (Fornara, 1977, no. 88).

By the 5th century BC many areas of the Greek-speaking world were producing inscriptions, often of some length. Athens was the leading producer, exploiting the high-quality marble of the Penteli and Hymettus mountains on which to inscribe decrees. The so-called Athenian tribute lists record the offerings (1/60 of the tribute payment) made to Athena by members of the Delian League. The lists were set up on the Acropolis in Athens and are the largest and probably the most studied series of documents from the 5th century. They provide a lengthy and detailed, if incomplete, list of the payments made by the individual cities who were subject allies of Athens from the middle of the 5th century to the last years of the Peloponnesian War (see Nixon and Price, 1990). In contrast to Athens, its main rival, Sparta, does not offer any detailed epigraphic record for the Classical period. Stone inscriptions were not produced in Sparta in any real quantity until the end of the Hellenistic period.

Inscriptions have many uses in exploring the past. They provide highly specific information, sometimes giving very accurate dates. Ancient chronology is complicated by different regional and civic dating systems. The Parian Marble lists historical events from the early history of Greece down to the 3rd century BC but is riddled with inconsistencies and confusions (Fornara, 1977, no. 1; Harding, 1985, no. 1; Austin, 1981, no. 1). The vast number of inscriptions from Athens provides a well-established body of carefully dated material. The day, month, and year, and the sitting public officials are given in the prescripts of most decrees of the Athenian people.

Inscriptions also offer a huge range of names and form the basis of the study of names (onomastics) and of named individuals (proposopography). The *Lexicon of Greek Personal Names* has collected all known instances of names from different regions of Greece; inscriptions provide the majority of the known evidence.

Inscriptions can also give particularly useful details about events and periods of history. Epigraphic evidence is often the only

contemporary documentary information which survives for certain periods of history. The Athenians formed an alliance in 378/7 BC with Thebes and other Greek cities; the founding agreement of the alliance has survived on stone but its existence is omitted, notoriously, from Xenophon's account of this period of 4th-century Greek history (Cargill, 1981; Harding, 1985, no. 35).

Other areas of cultural and social history are illuminated by the evidence of inscriptions. There has been considerable controversy over the extent to which the ancient Greeks practised exposure of infants. Pomeroy (1983) has argued on the basis of an inscription from late 3rd-century Miletus that selective female infanticide may have been practised among the families of mercenaries. Inscriptions supply enormous amounts of information and details about religious practices in antiquity. Sacred laws were inscribed on stone, as were calendars of religious festivals, dedications to deities, the financial accounts of cults, and decisions of cultic organizations.

The skill and dedication of those who study inscriptions have yielded valuable results. Different regions of the Greek world produced distinctive letter forms. In some areas there are sufficiently large numbers of inscriptions for experts to identify different "hands" of those who inscribed stones. S.V. Tracy has elevated the study and identification of the letter-cutters to such a high degree that many Athenian inscriptions of the 4th to the 1st centuries BC can be dated on the basis of the style of the carved letters alone (Tracy, 1990, 1995).

Inscriptions were erected by a variety of authorities in antiquity. The state decrees are the most useful source of information for historical events, often concerned with major events or individuals who played some role in them. The most common form of public decree records the community as a whole honouring an individual. Such honorific decrees can be very formulaic in their phrasing and award of thanks. Crowns of olive, ivy, oak, or gold, property ownership rights, seats in the theatre, public acclamation, statues, citizenship rights for an individual or his family and descendants, and of course erected inscriptions were all different ways in which people were honoured. Many of the honorific decrees from the 4th century onwards reveal important historical details: from Athens in the 270s the decree honouring Callias of Sphettus has revolutionized knowledge of the poorly documented first half of the 3rd century (Shear, 1978).

Public decrees also present important details about the political organization of communities. A collection of Greek public decrees made by Peter Rhodes allows such comparisons to be made among the epigraphically active Greek communities (Rhodes and Lewis, 1997). In the post-Classical period there was a massive increase in the

number of communities producing inscriptions, particularly in Asia Minor. The political ideology of a community is often transmitted in its decrees. Decrees were passed by the public assembly, or council, or subgroup of the community (e.g. deme, tribe, etc.). While it is exceptional that fairly detailed descriptions of the Athenian and Spartan constitutions are available from literary sources, the political structures of other Greek communities can sometimes be reconstructed only through the study of inscriptions.

Honorific decrees typically account for the achievements of the honorand, especially from the mid-4th century onwards. But a number of inscriptions self-consciously reframe past events for a contemporary audience. The Themistocles decree from Troezen (Fornara, 1977, no. 55) was inscribed in the 3rd century and provides details of the career of the Athenian general who laid the foundations for the 5th-century empire and commanded the Greek forces against the Persians in 480 BC. From Cyrene a 4th-century inscription erected in the temple of Apollo seems to contain the text of the oath of the settlers who had originally founded the city (Fornara, 1977, no. 18). The founders had travelled from Thera, and established the settlement on the Libyan coast which flourished under the Battiad dynasty in the archaic and early classical periods. The 4th-century text allowed people from Thera to claim property and rights in Cyrene on the basis of the terms of the original 7th-century agreement of the settlers which is here reinscribed. Both the Themistocles decree and the Cyrene inscription illustrate how inscriptions can contain unique documents which not only shed light on history, but also represent how history was shaped for subsequent generations in ancient Greece.

However, it is a mistake to think of inscriptions as simple archives of information. Certainly, decrees and laws served as extensions of a city's authority and legislation. Public records were kept in many Greek cities or temples, but often on perishable materials. The proportion of inscriptions written up on stone was always very small, but did at least represent an authoritative voice in a city's affairs. By the 3rd century BC collections of such decrees were being made, indicating that a far greater awareness of the information that the inscriptions contained was developing: Craterus (c.321–255 BC) published nine volumes of Athenian decrees.

But public decrees are only a small proportion of published inscriptions. A vast array of groups and individuals had inscriptions set up, e.g. groups of soldiers, demes, associations, religious organizations, ambassadors, kings, mothers, fathers, husbands, wives, widows, and children. The largest single type of inscription is the funerary monument; a rough estimate would suggest that of the known inscriptions from Athens between 400 BC and AD 267 perhaps as

many as 70 per cent are funerary.

The epigraphic habit of the Greeks was passed down to the Romans. Greek communities continued to inscribe throughout the period of the Roman empire and beyond. The numbers of the later inscriptions are much smaller and their study is less well established than for the Graeco-Roman periods. Inscriptions from the Byzantine period exist but are fewer and the material has not been studied thoroughly: funerary inscriptions are less elaborate and details of donors and benefactors appear painted on pictures.

The Frankish and Ottoman domination of the Greek world imposed different authorities. Few inscriptions survive from this period, and the epigraphic habit virtually died out. However, the study of inscriptions developed in the Middle Ages. Cyriacus of Ancona (1391–c.1455) visited Greece in the 1430s and 1450s and on both occasions recorded inscriptions. The Italian scholars of the Renaissance promoted epigraphy as a subject of value, and although their work concentrated on Italian material, it promoted an interest in inscriptions and enabled the future explosion of interest in Greek epigraphy. Numerous travellers to Greece continued to record inscriptions. In the 17th century, Jacob Spon and George Wheeler recorded texts; the stones themselves became desirable objects. Thomas Arundel collected ancient marbles, including both sculpture and inscriptions. His most famous inscription was the Parian Marble, a catalogue of dates and events drawn up and inscribed in 264/63 BC. The increasing popularity of the Grand Tour in the 18th century ensured that more travellers from western Europe reached Greece. Antony Askew, an English doctor and amateur philologist, recorded over 200 inscriptions at Athens in 1747. The intensifying interest in Greek culture in the late 18th and early 19th centuries resulted in the removal of many antiquities from Greece, most notoriously the Parthenon marbles. Inscriptions were among the stones removed from Greece, and in the early 19th century the study of epigraphic material reached new heights with the publication by A. Boeckh of the first volume of the *Corpus Inscriptionum Graecarum* (1828).

Inscriptions have become an easily identifiable feature of ancient culture. They offer a remarkable insight into the life and history of the people of antiquity. The legacy of ancient Greek inscriptions for Western culture is quite remarkable: one has only to visit any major 19th-century European cemetery to find imitations of inscribed gravestones from classical Greece. But it is the study of inscriptions and the appreciation of their importance in reaching an understanding of Greek culture that have progressed most rapidly in the last 200 years.

Instruments, Musical

Musical instruments, many of them borrowed from or shared with neighbouring cultures, have featured prominently in Greek music-making since antiquity. Whether played solo or in ensembles, they have been employed at various times in history for recreation, to accompany songs and dances, and to enhance religious and civic

ceremonial. Certain instruments and ensembles have tended to be characteristic of the musical cultures of particular geographic regions or historical periods, with others relegated to special functions or particular classes of people. In both ancient and modern Greece, for example, reedless pipes (*syringes* and *floyeres*) have been associated with shepherds, while rams' horns (*kerata*) and conches have been used as signalling devices.

Since very few specimens have survived even partially intact, scholars studying pre-modern Greek instruments rely heavily on the testimony of literature and art. The number of ancient literary references to instruments is vast and ranges from practical observations to discourses by Plato and Aristotle on their proper role in society. These are all predated by the representations of instruments in Cycladic statuettes of the 3rd millennium BC. Minoan, Mycenaean, and Cypriot art of the 2nd millennium BC depicts the use of lyres, harps, pipes, and other instruments in both cultic and domestic circumstances. For the organology of the Archaic and Classical periods, the many detailed representations of instruments and their players on painted pottery are particularly valuable resources. Much later, illuminated manuscripts and church frescos preserve important information regarding the instruments of the Byzantine and post-Byzantine periods.

Ancient Greek music was dominated by lyres and the wind instruments known as *auloi*. Hellenic lyres, unlike those of their neighbours, were always constructed symmetrically with a soundbox at the base and a pair of arms supporting a crossbar at the top. Suspended between the soundbox and the crossbar were strings of equal length. These were normally made of gut or sinew, passed over a bridge on the soundbox, and tuned at the crossbar by means of thongs or pegs. The instruments were played either by plucking the strings with the left hand or by striking them with a plectrum held in the right hand. Although variants on this basic design appear in ancient literature with overlapping appellations, Greek lyres may conveniently be grouped according to the shape of their soundboxes into box lyres and bowl lyres. Seven- or eight-string specimens of the louder and structurally more complex wooden box lyres, which featured a larger soundbox extending to the arms, appear in Minoan and Mycenaean art. Scholars have identified the smaller and simpler models with a reduced number of strings that appear in later geometric art with the *phorminx* of Homeric epic. With the emergence in the 7th century BC of the *kithara*, a lyre used by professionals in competitions, more elaborate versions again began to be depicted. Timotheos and other innovators of the 5th century BC subsequently extended the harmonic capabilities of the *kithara* through the addition

of up to five additional strings. In addition to a standard square-based concert model, several variants have been identified, including a rectangular “Italiote” kithara and a smaller “cradle” kithara normally played by women. Unlike these kitharas, bowl lyres (such as the *barbitoi*) had a small rounded soundbox made from a tortoise shell or wood covered by hide, and thin arms in the shape of horns, from which they were occasionally fashioned. Small models were employed by amateurs and in education, whereas the larger and therefore deeper *barbitos* was associated with the lyric poetry of Sappho and Alcaeus, as well as with scenes of revelry.

Despite its common mistranslation as a “flute”, the aulos was actually a cylindrical reed instrument with finger holes. Early models seem to have featured 3 to 5 holes, while later concert instruments are recorded as possessing up to 24. Although auloi with a single reed like the modern clarinet were probably not unknown, most were fitted with a double reed, thus making them akin to oboes and shawms (e.g. the modern Greek *zournas*). Some players wore a leather strap (*phorbeia*) around their head to support both their cheeks and their instruments, the latter of which came in various sizes and were usually played in pairs. Most artistic representations of paired auloi, the earliest of which is a Cycladic figurine in white marble of the mid-3rd millennium BC (now in the National Archaeological Museum, Athens), show instruments of equal length. Since most ancient art depicts the player’s hands in approximately the same position, it is likely that unison playing and heterophony were the norm. Nevertheless, the occasional use of drones and bursts of simple polyphony may be inferred from scattered literary references. Some of these passages, however, may refer specifically to the less common “Phrygian” auloi of unequal length, the larger of which is represented in art with an upturned bell. Credited with the ability to arouse strong emotions, auloi were used publicly in religious rituals, drama, and dance, and domestically at banquets and symposia.

The ancient Greeks employed a variety of other instruments in addition to lyres and auloi, the number of which increased in Hellenistic and Roman times. Harps (e.g. the *trigonon*, *pektis*, and *magadis*) were usually played by women in private during the Classical period, after which larger concert models evolved. Lutes appeared in Cyprus as early as c.1400–1200 BC, but it was not until the 3rd century BC that the three-stringed *pandoura* appeared on the Greek mainland. Other instruments that were adopted from the east in later centuries included the bagpipes and the *psalterion*, a form of zither. The *syrinx* (panpipes), as has already been mentioned, was generally considered a pastoral instrument, as was the later transverse flute (*syrinx monokalamos* or *photinx*). Rattles (e.g. the *seistron*, borrowed from

Egypt), cymbals (*kymbala*), clappers (*krotala*), drums (*tympana*), and other percussion instruments were used for apotropaic purposes, for rhythmic accompaniment, or as toys. Early brass instruments such as the trumpet (*salpinx*) were used mainly for signalling, for example to sound the attack in battle or to issue a call to worship. During the Roman period, however, fanfares played by military bands of brass and percussion instruments became a fixture of state ceremonial and remained so until the end of the Byzantine empire.

Also rising to prominence only after the classical era was the *hydraulis*, a hydrostatic organ invented during the 3rd century BC by the Alexandrian engineer Ctesibius. According to Hero, the *hydraulis* supplied a steady flow of pressurized air to its pipes with a piston that expelled water from a chamber (*pnigeus*) lying at the bottom of a scaled cistern. Initially this invention appears to have attracted little attention, but a Delphic inscription of 90 BC records the prize-winning participation of an organist in a competition. Sometime around the 2nd century AD the mechanically complex piston was replaced by bellows, which could be used with or without a cistern. By late Antiquity large organs with multiple ranks had become common in amphitheatres and other public venues, while smaller instruments often graced banquets.

Ioannina

City in Epirus

Located on the western slopes of Mount Pambotis in the centre of Epirus (the northwesternmost district of Greece), the city of Ioannina has over its long history come under the control of a number of different cultural influences. The site on which Ioannina now stands has been invaded by Alexander the Great, by Byzantines, Romans, Normans, Venetians, Serbs, Turks, Albanians, and, finally, in 1913, by Greeks, who joined Epirus to the modern Greek state in the course of the Balkan Wars. Despite these many external influences, Ioannina has throughout its history been known as a centre of Hellenism.

Much about the city's origins is hotly debated – even its name is of uncertain provenance. Numerous historians (Leake, Hatzedakes, Aravantinos) argue that the name “Ioannina” is taken from the monastery of John the Baptist; others claim that the city was first named after an unidentified Slav called Ioannes; others still that Ioannina was the name of the daughter of one of Justinian I's most valued soldiers.

While it is unclear exactly when the site was established as a city, the historical record indicates that the area has had a sizeable population since the time of Alexander the Great (d. 323 BC). The province of Epirus, of which Ioannina is now capital, was under Roman rule from 168 BC to AD 375. The settlement's growth and establishment as a city of significant proportions was effected under Byzantine rule, which began in AD 375 and continued (with interruptions) until 1430.

Ionians

Ancient Greek ethnic group

The term “Ionian” was employed in two senses in antiquity. In the first place it designated the Greek populations settled in the coastal cities of central Asia Minor and occasionally, by extension, the neighbouring populations in the Troad area in northwest Asia Minor (more properly Aeolians) and in southwest Asia Minor (more properly

Dorians). This designation may possibly have originated as a general external appellation for Greeks, who were known throughout the east as Yawani (cf. Old Persian *Yauna*; Old Hebrew *Javan*). However, the term could also be used in a broader sense: in the historical period Athens, Euboea, the Cycladic islands, parts of Sicily (Naxos, Leontini, Catana, Zancle, Rhegium), Italy (Cumae, Siris) and the western Mediterranean (Massalia, Emporion) as well as the central coastal strip of Asia Minor all claimed a common Ionian identity on the basis of perceived similarities in dialect, rituals, customs, and shared origins. It is entirely possible that the second definition was a historically later extension of the first.

Recent archaeological excavations at Ephesus claim archaeo-logical continuity from the Mycenaean age into the Geometric period. By contrast, although the Homeric epics list “Ionians with their flowing tunics” among the Greek contingents at Troy (*Iliad*, 13. 685), there is no mention of Ionians established on the coast of Asia Minor. Indeed, the earliest extant literary references stress that the Ionian cities of Asia Minor considered themselves to be relatively recent foundations from mainland Greece: the 7th-century elegiac poet Mimnermus (fr. 9) describes how Colophon was founded by Pylos, while 5th-century sources attribute the foundation of Priene to settlers from Thebes (Hellanicus, frag. 101), of Miletus to Neleus, son of the Athenian king Codrus (Herodotus, 9. 97) – dated to 1077 BC by the Parian Marble – and of Ephesus to another son of Codrus named Androclus (Pherecydes, frag. 155); Yet another tradition told how the Ionians had originally occupied the northern part of the Peloponnese but had been expelled by Achaeans fleeing the Dorian onslaught and sought refuge in Athens, from where they had set out to colonize Asia Minor (Herodotus, 1. 145, 7. 94; Pausanias, 7. 1. 2–4). It is no doubt the diversity of these foundation accounts as much as prejudice that caused Herodotus to question the ethnic homogeneity of the Ionians, attributing their origins to an admixture of Abantes from Euboea, Minyans from Boeotian Orchomenus, Cadmeans, Dryopes, Phocians, Molossians, Arcadian Pelasgians, and Dorians from Epidaurus.

Although Athens often plays a central role in many of these 5th-century foundation accounts, there is no explicit testimony that it subscribed to a shared Ionian identity before the early 6th century BC when the Athenian statesman Solon (frag. 4) referred to Attica as “the oldest land of Ionia”. The Homeric *Hymn to Apollo* implies that Delos hosted a pan-Ionian festival, possibly by the middle of the 7th century BC, while the Panionium to which Herodotus refers (1. 141–142, 148) was a league of 12 cities (Miletus, Myus, Priene, Ephesus, Colophon, Lebedus, Teus, Clazomenae, Phocaea, Samos, Chios, and Erythrae), centred on the sanctuary of Poseidon Heliconius at Cape Mycale,

which was certainly functioning by c.600 BC and possibly even earlier.

At the level of dialect, cult, and institutions, Ionian cities shared some undoubted commonalities, though these were not always exclusive or universal. The dialects of the cities of Asia Minor and the Cyclades are the closest and are related to the dialects of Attica and Euboea, but the Ionic dialect also seems to have been spoken in the Dorian city of Halicarnassus by the 5th century BC. A number of festivals (Anthesteria, Apaturia, Boedromia, Lenaea, Plynteria, Pyanopsia, and Thargelia) appear to be characteristic of Athenian and Ionian calendars, although Herodotus (1. 147. 2) says that the Ephesians and Colophonians do not celebrate the Apaturia. Similarly, the citizen bodies of many, though not all, Ionian cities were distributed among the four Ionian “tribes” of the Hopletes, the Aigikoreis, the Geleontes, and the Argadeis.

From the end of the 7th century BC the Ionian cities of Asia Minor were subject to periodic attacks from the neighbouring Lydians, culminating in their conquest by Croesus of Lydia in the mid-6th century and then their incorporation into the Persian empire following Croesus’ defeat at the hands of Cyrus the Great c.546 BC. Whether as a result of crippling taxation demands and autocratic abuse or simply the personal ambitions of Greek puppet-tyrants, many of the Ionian cities revolted from Persian rule in 499 BC under the leadership of Aristagoras of Miletus. With the assistance of Athens and Eretria as well as of Carians, Cypriots, and Hellespontines, the Ionians scored some early successes – including the sack of the Lydian capital Sardis – but the revolt was ultimately a failure; following a naval defeat at Lade in 494 BC where the Ionian contingent faced a Phoenician navy almost twice its size, Miletus was sacked and its inhabitants killed or enslaved. The Ionian cities passed back to Persian suzerainty until after the Persian Wars of 480–479 BC.

It may be as a consequence of the Ionians’ perceived readiness to endure the rule of barbarians that Athens began to downplay its own Ionian associations: according to Herodotus (1. 143. 3), the Athenians and Euboeans avoided calling themselves Ionians because they were ashamed of the name (since c.506 BC much of Euboea had passed under direct or indirect Athenian control). This new attitude becomes particularly apparent after the Persian Wars when Athens began to stress its own autochthonous origins over its traditional Ionian ties, though this is perhaps prefigured as early as 508 BC when the Athenian statesman Cleisthenes replaced the old four Ionian tribes with ten new tribes named after Attic heroes. It was not, however, politically expedient for Athens to sever all ties with the Ionian cities of the Cyclades and Asia Minor – not least because Ionians constituted a majority of the cities of the Delian League who from 478/77 BC were

required to pay tribute to Athens to secure protection against further Persian aggression. The solution that Athens adopted was to make slight but subtle modifications to the vocabulary of its relationship with its tributaries by which the Ionians were no longer placed on an equal footing of kinship but regarded as colonists owing their Athenian metropolis certain obligations. The dependency of this relationship was asserted at the quadrennial Great Panathenaea at which the cities of Ionia were instructed to provide a cow and a panoply to be displayed during the festival. At the same time, Athens sought to bolster a sense of common identity among its Ionian allies by promoting cults to Athena, Ion, and the four eponymous Ionian heroes on Samos and by reorganizing the pan-Ionian festival on Delos (Thucydides, 3. 104. 2). This exploitation of Ionian identity for political purposes became even more marked in the course of the Peloponnesian War, partly in opposition to the claims to shared Dorian origins that Sparta and its allies were proclaiming. Thucydides (3. 86. 3, 6. 6. 1) notes that early Athenian intervention in Sicily in 427 BC and again on the occasion of the later, disastrous Sicilian expedition of 415–413 BC was justified on the specious pretext of shared Ionian kinship.

Appeals to a common Ionian identity began to subside following the Peloponnesian War. Athens was now confident in its autochthonous origins, the Ionian cities of Sicily had begun subscribing to a broader “Siceliot” identity, and the Ionian cities of Asia Minor were effectively distanced from their Ionian kinsmen to the west by the reincorporation within the Persian empire – ratified officially under the terms of the King’s Peace of 387/86 BC. The Panionium itself continued to function – at some point in the early years of the Peloponnesian War it had been transferred to Ephesus on the grounds of safety but then restored in the early 4th century to Cape Mycale where it is still attested in the Roman imperial period (Strabo, 14. 20. 1)–and throughout the Hellenistic and Roman periods Panionia festivals were celebrated in many of the cities in Asia Minor.

Iron

Iron differs from other metals used in antiquity in almost every way. The ores are widespread and abundant, but smelting requires much higher temperatures than other metals. Most smelted iron is inferior to bronze, but steel, an alloy of iron and carbon, has properties far in advance of other metals used in antiquity. However, the qualities of steel can only be brought about under carefully controlled conditions of temperature and chemical environment. For these reasons iron replaced bronze very gradually: although the first smelted iron dates from the 3rd millennium BC, iron only came into general use in the Aegean region around 1200 BC. A contributing factor may have been a shortage of tin for making bronze.

Iron is a common element in the earth and rich ores were readily available in antiquity. There were four principal types – metallic iron in meteorites, primary ore in rocks, iron-rich sands, and iron-rich fossil soils (laterites).

Natural metallic iron only occurs in meteorites and very rare terrestrial rocks not found in the Aegean. Meteorites were certainly known in the ancient Greek world: Anaxagoras of Clazomenae examined a meteorite and concluded that heavenly bodies were made of the same material as the earth. They were also venerated at Pessinus (Asia Minor) and possibly elsewhere, but no authenticated meteorites survive from this period. It has been suggested that some early iron objects were made of meteoritic iron on the basis of their chemical composition, primarily their high nickel content. However,

such analyses may be suspect as it is only the oxidized surface that is commonly analysed, which is enriched in nickel. In addition, some iron deposits contain substantial quantities of nickel that were sometimes incorporated into the final metal. Finally, most meteoritic iron is difficult to work, unsuitable for making tools, and only available in small quantities.

Many of the primary ores exploited in Greece were precipitated where hot watery fluids released during the crystallization of granite reacted with limestone or marble. Such fluids also carried other metals that were deposited under different conditions. Seriphos was the main source of such ores – the amount of slag from smelting indicates that seven million tonnes of iron were mined here from antiquity onwards. Two different ores were extracted: those at Playa near the centre of the island were deposited at high temperatures (500° to 600°C) and are rich in magnetite. The limonite iron deposits of Mega Livadi were formed at lower temperatures away from the granite. Similar deposits were exploited near Neapolis in the Peloponnese.

One of the largest underground palaeolithic mines in Europe was on Thasos. These deposits were initially exploited for ochre, a red pigment used for cult purposes. From the 9th century BC onwards extraction of iron ore for the production of metal became important from these and other deposits on the island. Sources were limonite/haematite ores associated with silver and gold ores formed in dolomite. Beach sands rich in magnetite and ilmenite (iron-titanium oxide) were also exploited here, and probably elsewhere in the Aegean.

Laterites are ancient “soils” rich in the iron mineral haematite that were formed during Early Cretaceous time (about 90 million years ago) when a tropical climate prevailed in Greece. Intense weathering of the serpentinite bedrock removed most of the chemical elements in solution, leaving behind a layer on the surface up to 10 m thick enriched in iron and nickel. In some areas the laterite was eroded and the sediments transported by rivers to be redeposited on top of Jurassic limestones. At the end of the Cretaceous period the sea invaded the area and limestone was deposited on top of both types of laterite.

Laterites were exploited for iron in Boeotia and Euboea. Pliny mentions an occurrence of iron ore near Hyettos, about 8 km north of Lake Copais. The deposits occur in the mountains northeast of Chalcis, near the Aegean coast (the range that includes Mount Dirphys), and on the adjacent mainland, in northeast Boeotia, between Lake Copais and the north Euboean Gulf. They can be seen as long, thin, meandering lines of dark-red rock between paler limestones or greenish serpentinites. Some of the same deposits have been exploited

recently for nickel. Iron produced from these deposits under certain conditions of smelting contained some nickel.

In antiquity iron was used for statues, tools, utensils, and various decorative purposes. It was usually smelted and worked in the solid state, without melting. Iron ore and charcoal were packed into small cylindrical furnaces and fired to over 1000°C. Towards the base of the furnace some of the iron ore was reduced to tiny flakes of metallic iron by the charcoal. Further up in the furnace some of the iron ore combined with silica in the ore or parts of the furnace to form a molten slag dominated by iron silicates that prevented the metallic iron beneath from reoxidizing. The mass of metallic iron thus formed is called a bloom and is very pure. At the end of the firing the bloom was lifted out and the processes started again. The bloom contained much slag that had to be removed by hammering at orange heat (smithing) before the metal could be used. Some slag was always left in the finished product but this did not diminish its properties significantly and enabled pieces to be welded by hammering. Iron produced by this process was a soft metal that needed to be converted to steel by the addition of carbon before the metal could realize its full potential. To make steel suitable for weapons, smithed iron was packed in charcoal dust and sealed in clay containers to prevent oxidation. It was then heated to red heat for several hours to days. This mass of raw steel was worked to form the desired object. The final step necessary to develop the full strength of the steel was tempering. In this process the finished object was reheated to a special temperature and cooled at a controlled rate. With the precision necessary for all these steps it is no wonder that successful early smiths were so highly regarded.

Isocrates c.436–338_{BC}

Orator

Isocrates was an enormously influential Athenian rhetorician. Much is to be gained in understanding his views if it is noted that his life stretched from the time of Pericles to the victory of Philip of Macedon over the free Greeks at Chaeronea; he was first and foremost an ardent patriot of his city, yet he was willing to imagine his polis working as an ally with the newly emerging strongmen of the Greek world. Conservative in outlook, he was also a powerful spokesman for Panhellenism – however, a Panhellenism that always put his native city first. His work, chiefly long epideictic or “display” orations that were not in fact orally delivered (he did not possess a strong voice), was read and cited well into the Byzantine period; his style of writing, itself reflecting the influence of his teacher, the Sophist Gorgias, was widely admired and imitated as a model of Attic prose. He was also an important teacher of composition for orators and historians: many of his “students” were themselves to be significant figures in the field of letters.

His earliest extant works are six speeches that he wrote for others to deliver in courts of law: like his slightly older contemporary Lysias, he was a *logopoios* in his early years, after his family’s wealth had been destroyed in the Peloponnesian War. He soon gave up this career, and turned to producing large-scale public orations and other essays. He wrote two encomiastic treatises, the *Helen* and the *Busiris*, much in the tradition of his teacher Gorgias. His *Evagoras*, an oration addressed to that Cypriot king’s son and successor Nicocles, is one of the earliest pieces of biography in Greek literature, alongside Xenophon’s *Agesilaus*. In a similar vein, he also wrote a number of open letters, primarily to kings in the Greek world.

Isocrates’ main achievement, however, lay in his long and elaborate epideictic speeches. The *Panegyricus* (c.380_{BC}) is a Panhellenic speech advocating an all-Greek expedition against Persia, and at the same time defending Athens’ imperial past and attacking Sparta. The *De Pace* (On the Peace, 355_{BC}) represents something of a change in views: it urges Athens to make peace with its rebellious allies of the Second Athenian Confederation (founded 378_{BC}) and recommends that the Athenians “make lasting peace with all the world”, including Persia. A return to the views of the *Panegyricus* is represented by the *Philippus* (346_{BC}), although now the standard of Panhellenism is to be held by

Philip of Macedon, working together with the Athenians at the head of an all-Greek coalition.

Some of his other great orations tell us more about Isocrates' life, political views, and influence. The *Areopagiticus*, written at about the same time as the *De Pace*, is a criticism of moral decay at Athens and a plea for a return to the limited democracy of Solon and Cleisthenes. In *Against the Sophists*, written early in his career (c.390 BC), Isocrates tried to differentiate himself from other teachers of rhetoric. The *Panathenaicus* (339 BC) is the last work he wrote and is a summation and defence of his career. Perhaps the most important statement of his views on rhetoric is contained in his *Antidosis*, written in 354/53 BC. It has many points in common with his earlier *Against the Sophists*; further, it contains extracts from his own earlier speeches, and may even allude at points to the famous defence of Socrates. It is in this speech that Isocrates states quite plainly that people can become better and more worthy if they become desirous of speaking well. Isocrates is reputed to have taught the orators Isaeus and Hyperides, and the historians Androtion, Ephorus, and Theopompus, though many today would want to modify this claim, emphasizing Isocrates' influence on others, rather than any actual instruction he may have given.

Isocrates' belief that rhetoric is crucial in the education of leaders became a central tenet of antiquity. For Cicero he was "the father of eloquence" and the "teacher of all orators" (*De Oratore*, 2. 10. 94). It is hardly surprising, then, that his work was influential throughout the Byzantine period. Isocrates was an important model for the Church fathers Basil and Gregory of Nazianzus. Further, he was a central figure for Byzantine educational canons, widely regarded as a model of Attic prose style and a source of moral *dicta*. The *Suda* relies heavily on his work; Manuel II Palaiologos mines him for *sententiae*. Further, his work helped to define the Byzantine ideal of Athens: it is significant that John Malalas groups him (*Chronicle* 214) with Pericles and Thucydides, as opposed to 4th-century BC figures. Despite the lack of interest in the first printed edition of his work (Aldus Manutius, Venice, 1493), he became a central figure in the modern period for defining the educational methods of cultural humanism: Werner Jaeger (*Paideia*, 3. 46) has noted that he is rightfully called the "father of humanistic culture".

Biography

Born c.436 BC in Athens, Isocrates studied under the sophists Prodicus and Gorgias. In the 390s he wrote speeches for others to deliver in court. But soon he changed to

producing large-scale orations and teaching rhetoric to others. His pupils are said to have included the general Timotheus, the orators Isaeus and Hyperides, and the historians Androtion, Ephorus, and Theopompus. His writings were much admired for their purity of style. He starved himself to death in 338 BC.

Italy

The Italian peninsula in southern Europe in which the Roman empire later emerged has been exposed to interaction with Greek civilization throughout its recorded history. Many tribes made up the population of the Italian peninsula, which is one of the reasons why the unification under Rome was considered to be a great achievement. Evidence of Minoan and Mycenaean trade has been found in many places, particularly in the southern part of the peninsula and Sicily. There is a history of political, cultural, and religious relations, and intricate reciprocity of influence from one side to the other. Relations with the Greek world were first established by the Etruscans, located mainly in northern Italy. To give one simple example, the Latin alphabet is believed to have been borrowed by the Romans from the Etruscans, who in their turn had taken it from the Greeks c.700 BC. Etruscan art, particularly sculpture and painting, as well as architecture, largely followed the development of Greek art, although it was significantly different. Etruscan culture influenced early Rome in its political organization and religious cults. Whether originating from the East (according to Herodotus, who believed that they came

from Lydia), or indigenous Italian (as Dionysius of Halicarnassus thought them to be), their expansion depended much on trade. Through trade they came into contact with many people. Contact with the Greeks was intensified after Greek colonization.

In the period from 800 BC to 500 BC, traders from Greece reached south Italy and Sicily. Mostly for reasons of overpopulation and unfair distribution of land, as well as the need for expansion of trade, Greeks began to colonize places abroad that could offer rich agricultural production and defensible harbours. The use of the terms “colonization” and “colony” for this new kind of settlement is extremely misleading since many of the modern connotations attached to them are not applicable. With the exception of Athens and Thebes, most Greek city states seized every opportunity to expand, particularly in south Italy and Sicily where the climate and agricultural possibilities are very similar to those in mainland Greece. The first Greek settlement (c.750 BC) was at Cyme, mostly known by its Latin name Cumae, founded by the cities of Chalcis, Eretria, and Cyme in Asia Minor. Sparta founded only one colony, Taras, in south Italy in 706. Corinth established Syracuse in Sicily in 733 BC. Naxos founded Naxos in Sicily, Chalcis founded Leontini and Catane, Megara founded Megara Hyblaea. Chalcis later founded Rhegion (modern Reggio) in Calabria. By the 5th century BC, south Italy (but not Sicily) was referred to as “Magna Graecia”. Many of the cities that were founded in Archaic and Classical times still bear traces of their Greek past, such as Taras (Latin Tarentum), Syracuse, Poseidonia (Latin Paestum), Tauromenium (Latin Taormina), Acragas (Latin Agrigento), or Gela. A colony was a separate polis. Although it was independent of the home state, it maintained real links with the mother city. The mother city was often asked to protect the colony when in danger and the Sicilian expedition in the Peloponnesian War is an example of the kind of relations and tensions that prevailed between mother city and colonies.

The Greeks often came into contention with the people of the Italian peninsula. The Etruscans were defeated by the Greeks at Cumae in 474 BC. Meanwhile, until the 3rd century BC Rome was expanding rapidly in the Italian peninsula. The Latin tribes, the Oscans, and the Samnites soon came under Roman control. There remained only the Greek city states of the south. In the 3rd century the Greeks of Taras, alarmed by Roman expansion, asked for help from Pyrrhus, king of Epirus. He defeated the Romans at Heraclea and Asculum (280 BC and 279 BC) but lost the battle at Beneventum in 275. After that the Romans were kept busy in their wars against the Carthaginians from 264 to 146 BC. They were, however, also drawn into the turbulent affairs of the Hellenistic world – in the Aegean against King Philip V

(221–187), and further east against King Anti-ochus III (223–187). In a series of Macedonian wars enmities among the various Greek city states and leagues also played a significant role. In 197 BC Philip V was defeated and Greece was declared free after the battle of Cynoscephalae. There was now a precedent for Roman intervention in Greek and Hellenistic affairs. King Perseus, the son of Philip V, was no more effective than his father against the Romans. Thus in 146 BC Greece became a Roman province; and in 133 BC Pergamum was bequeathed to Rome by King Eumenes III and also became a province.

Besides action at the military and political levels, it was with the Roman conquest of the Hellenistic world that Hellenic, or rather Hellenistic, culture permeated many aspects of Roman life. An attempt was slowly made to create a Roman literary culture according to the Greek ideal. Already from the time of the Carthaginian wars attempts had been made by Livius Andronicus to translate Homeric epic poetry into Latin. Plautus wrote comedies in the style of Menander. Accius and Pacuvius also wrote comedies and tragedies. Besides the adaptation of many literary genres that had flourished in the Greek world the Romans tried to explore unique Roman ideals in literature and philosophy, that would be canonized later in the Golden Age of Augustus. Cato the Elder reproached the Romans for imitating the Greek way of life. In the realm of religion many cults of the Greek city states entered the Roman pantheon, particularly that of Dionysus. Greek deities had already acquired their position in the Roman pantheon and been given a Latin name. In art and architecture, the meeting of the Greeks and Romans became even more obvious. Many models were copied. Greek educational principles were also transmitted to Rome. Later, both in the republic and in the empire, many Romans' went to Athens to pursue their studies, especially in philosophy and rhetoric. In the philosophical works of Cicero it became obvious how Hellenistic philosophy acquired a Roman setting and terminology. Earlier poets, like Lucretius or Catullus, as well as the poets of the Augustan age, drew context and forms from the early Greek literary productions as well as from Hellenistic culture, transforming them into completely new material. Prose writers such as Livy also inherited some elements from their Greek predecessors. On the other hand; there were Greek authors, such as Dionysius of Halicarnassus, Diodorus Siculus, and Polybius, who wrote in Greek about Roman matters. After the unification of Italy under the Roman empire, the meaning and identity of the word Roman was established. But there were still Romans who wrote in Greek, such as the emperor Marcus Aurelius in the 2nd century ad. Many scholars have seen in this period a decline of the Classical ideal, whereas in fact it bears witness to the emergence of new, well-defined tendencies in literature,

philosophy, religion, and art.

The spread of Christianity soon reshaped the tensions in the Mediterranean world. The interaction between Greek and Italian was acquiring a new dimension as the Christian religion grew stronger. At first, the new debate of Christian versus pagan appeared in contemporary literary and rhetorical writings, whereas later, once Christianity was established, the debate centred on the Greek versus the Latin rite in ecclesiastical matters. With the establishment of Constantinople as the “new Rome” the polarity between East and West entered a new phase.

Ivory

Ivory (*elephas*), properly speaking, is the dentine of elephant tusks, and it is from this material that the animal takes its name. The term also commonly denotes material obtained from hippopotamus, sperm whale, and walrus tusks, which, like all tusks, are teeth of continuous growth. There is no evidence that the last two animals supplied any of the ivory employed in the eastern Mediterranean, but elephant and hippopotamus ivory was imported to Greece, directly or indirectly, from the natural habitats of those creatures, i.e. Africa, the Levant, and India. Mammoth ivory, while available to Greeks in small quantities locally as well as from abroad, appears to have been rarely, if ever, used for carving, although a few chance finds may have served as trophies in antiquity, for example, the tusks of the legendary Caledonian boar. Actual boars' tusks adorned the helmets of elite warriors in the Mycenaean period and are mentioned in the Homeric epics.

Whatever its source, ivory was highly prized, serving as a symbol of wealth, status, and prestige from the Bronze Age, through the Classical

and Byzantine periods, into the modern era on account of its exotic origins, aesthetic quality, and reputed magical properties (as in the myths of Pelops and Pygmalion). Its smooth, creamy-white surface, warm lustre, density, and flexibility add to its appeal, and its physical characteristics allow it to be worked by a variety of techniques: it can be carved in the round or relief, cut into veneers or inlays, turned on a lathe, and even moulded. Most ivories were ultimately polished, painted, and gilded. A multipurpose commodity, ivory was employed in all periods in the manufacture of statues, reliefs, furniture components, appliqué, pyxides, handle attachments, pinheads, brooches, bracelets, combs and other toilet articles, seals, game pieces, and amulets.

The beauty and value of ivory are recognized in the earliest Greek texts, as in the Old Testament and earlier Near Eastern documents. The Mycenaean Linear B tablets inventory ivory weapons, chariots, and furniture, and similar objects mentioned in the *Iliad* and *Odyssey* symbolize royal affluence. That ivory-carving flourished in Minoan and Mycenaean society is also evidenced by numerous physical survivals from Bronze Age sites, including raw ivory from Zakros and the Ulu Burun shipwreck, and workshop debris from Knossos, Mycenae, Pylos, and Thebes. Reliefs intended for appliqué are the most common finds, but excavators have also recovered numerous other objects, among the finest of which are the fragments of a 50-cm-tall composite figure of a standing youth excavated at Palaikastro in eastern Crete (Siteia Museum). The exquisite carving of anatomical details of the Palaikastro youth far surpasses that of similar figures in all other media, underscoring not only the superior qualities of dense, fine-grained ivory as a material for sculpture, but also the fact that precious imported tusks were regularly entrusted to the most experienced craftsmen, who, presumably, had been trained in wood-carving, an art now largely lost. Blackened by fire, broken, and much restored, the Palaikastro statuette, like other unequivocally genuine Minoan ivory statuettes excavated at Knossos (Herakleion Museum), originally consisted of numerous individually carved components joined by complex systems of dowels and mortises. The Palaikastro figure also had rock-crystal eyes, stone hair, wooden nipples, and a golden loin cloth and sandals. This statue appears to have been painted, as were ivories in the Classical and Byzantine periods, although such ornamentation is often lost. (Technical, stylistic, and iconographic anomalies indicate that a number of “Minoan” ivory statuettes in collections outside Greece, inevitably said to be from Knossos, are modern forgeries.)

Ivory production in Greece naturally declined sharply during the so-called Dark Age of the late 2nd to early 1st millennium BC, but the

material reappears in the Geometric and Orientalizing periods along with motifs and perhaps even craftsmen from the Levant; for 8th-, 7th-, and 6th-century carved ivories recovered from Crete, Athens, Ephesus, Samos, Laconia, Delphi, Perachora, and elsewhere, though sometimes exhibiting local stylistic features, closely parallel items that have been excavated in great quantity in the ancient Near East, particularly at Nimrud.

Like their Bronze Age ancestors, wealthy Greeks of the Archaic, Classical, and Hellenistic periods employed ivory, often combining it with other materials, to furnish their homes and gain the favour of the gods. Luxury furniture is best known from depictions on painted pottery and stone reliefs, but ancient texts, especially the inventories of the temples on the Athenian Acropolis and Delos, fill out the picture. Tombs have yielded fragments of ivory furnishings, but more have been recovered from sanctuaries. Indeed, many surviving ivory statuettes that are often presented as free-standing figures preserve cuttings in their heads or backs that indicate their original function as components of furniture, toilet articles, or even musical instruments. Most renowned in antiquity, however, were free-standing chryselephantine statues, composite works of gold and ivory. Produced at a variety of scales, these were assembled from individually carved ivory faces, hands, and feet attached to wooden armatures that were subsequently sheathed in gold. The hair of such figures, too, was rendered in gold, and these statues, gleaming and guttering in the half-light of temples or treasury buildings presented stunning images of the gods. Most such works are lost and known only from later literary sources. Pausanias, for example, saw a number of early figures ascribed to pupils of the legendary craftsman Daedalus, as well as the gold, ivory, and cedarwood chest of Cypselus collected in the Heraion at Olympia. These objects do not survive, but a cache of votives from Delphi of the 6th century BC illustrates the technique and provides a notion of the appearance of such images, though they were burned in antiquity and are now much restored.

Ancient authors explicitly state that the expense of ivory, along with its warm and lustrous colour, so closely approximating unblemished flesh, made it fitting for representations of divinities, and in the Classical period a combination of political and technological developments contributed to the unprecedented use of ivory in colossal statuary. The Athenian decision to erect a monumental statue of Athena (447–438 BC) inside the Parthenon was the result of competitive emulation. Monumental statues had long been erected in stone and bronze, but Phidias combined techniques of furniture-veneering, bronze-casting, and ship-building to create a gigantic composite work in gold and ivory approximately 12.75 m tall. Literary

and physical evidence suggests that the Athenian sculptor adapted techniques of unscrolling tusks into thin sheets of ivory that were subsequently softened in acidic baths and then moulded in (or over) clay or wooden forms. This ivory skin, like the hammered gold that formed the drapery (weighing approximately 1137 kg in the case of the *Athena Parthenos*), was then affixed to a massive armature built around a wooden beam, the cutting for which survives in the floor of the temple. The resultant image of the ivory-skinned *Athena Parthenos* robed in golden garments ignited a trend throughout Greece as various city states commissioned similar statues of their own patron deities to demonstrate their piety, wealth, and power. Phidias' second essay in the genre, the *Zeus* at Olympia, came to be ranked among the seven wonders of the ancient world. Praised by numerous ancient authors, it was considered to have added something to traditional religion, and Phidias himself was thought to have travelled to Olympus, so accurately did he capture the essence of the god. This statue, like the *Parthenos*, is lost, known only from ancient descriptions and representations in other media. The workshop in which it was produced, however, was identified by Pausanias, and has been excavated: ivory wasters, bone chisels, terracotta moulds for glass inlays, and even a cup inscribed with Phidias' name are among the finds displayed in the Olympia Museum.

Phidias reputedly made additional chryselephantine statues (and pseudo-chryselephantine ones consisting of marble and gilded wood) at Elis, Plataea, and Pellene, and ancient sources report that similar works were produced at Argos, Megara, Elis, Athens, Calydon, Delos, and Epidaurus in the late 5th and 4th centuries BC by Polyclitus, Theocosmos, Colotes, Alcamenes, Menaechmus and Soidas, and Thrasymedes. Previously reserved for representations of the gods, ivory statues eventually came to be employed by mortal rulers seeking their own glorification, beginning with Philip of Macedon and his son Alexander, who erected a chryselephantine family group by Leochares in the Philippeion at Olympia, not far from Phidias' *Zeus*. Later ivory portraits are also mentioned by ancient authors. Special provisions were made for the maintenance of the largest statues: at Athens and Olympia reflecting pools of water and oil, respectively, were considered beneficial to the ivory, and special "polishers" (or "descendants of Phidias") looked after Phidias' statues.

Meanwhile, ivory continued to be employed for the adornment of the many sumptuous objects mentioned above, as well as for the decoration of the doors and ceilings of temples, and even the panelled rooms of the luxury barges of Hellenistic kings. Best preserved are the composite figurines that decorated couches recovered from Macedonian tombs (Thessalonica Museum). The monetary value of

ivory, which was worth approximately one quarter its weight in silver in the 4th century BC according to building inscriptions at Delphi, naturally fluctuated according to its availability. The eastern conquests of Alexander increased supply, and the vast accumulations of the material by his successors are demonstrated by the thousands of tusks recorded to have been displayed in later Roman triumphs. Some Greek ivory statues were eventually carried off to Rome, and the chryselephantine technique continued to be practised under Roman rule: at Athens the emperor Hadrian commissioned another colossal *Zeus* for the Olympieion, and Herodes Atticus dedicated a *Tyche* in that city as well a *Poseidon-Amphitrite* group at Isthmia.

The fate of most of the great Classical ivory statues remains uncertain. Ancient sources record almost 200 such works in Italy, Greece, and the eastern Mediterranean. Not one of these survives, but components of dozens of others have been recovered. Many, depicting pagan gods, were no doubt destroyed by Christian iconoclasts. Phidias' *Zeus Olympios* is said to have been carried off to Constantinople, where it appeared in a Christianizing allegorical programme in the Palace of Lausus, providing a model for the bearded image of Christ Pantokrator before being destroyed by fire in the late 5th century ad. On a considerably smaller scale, ivory continued to be a popular medium for works in diverse genres in the Byzantine period. That its price had fallen considerably from Classical times is clear from the Edict of Diocletian, which lists it at one-fortieth the value of silver.

From the 4th to the 6th centuries statuettes, caskets, plaques, furniture, and other items decorated in classicizing styles with motifs from pagan mythology as well as Christian iconography were produced in Egypt, presumably at Alexandria, as well as Constantinople. Although scholars debate the precise origins of many late Antique and Byzantine ivories, an edict of AD 337 lists ivory workers among artisans exempted from civil obligations so that they might improve their craft and instruct their children, indicating how techniques were transmitted. A slightly later edict restricts all but ordinary consuls from distributing ivory diptychs, suggesting the widespread manufacture of these ceremonial gifts, distributed to celebrate the donor's attainment of the highest magistracy. Many of these socially and politically significant objects survive, having later entered church treasuries on account of their valuable material and the high quality of craftsmanship.

J

Jewellery

The earliest evidence in Greece for jewellery consists of a few small shells pierced with suspension holes that survive from the Palaeolithic period. By the Neolithic period (c.6800–3000 BC), however, jewellery making had begun in earnest. Consisting of valuable objects of personal adornment that may have originally served as protective amulets, jewellery during this early time indicated the wealth and social status of its owners. Common materials for jewellery in the Neolithic period included animal bone, shell, clay, stone, bronze, and gold. Precious stones were virtually unknown at this time, and silver was rare as well. Typical forms included highly stylized anthropomorphic pendants, beads for necklaces, simple finger rings, bracelets, pins, and mouthpieces. The gold and bronze jewellery from the Neolithic period is invariably hammered and cut into sheets. The discovery of precious gold and bronze jewellery in Neolithic cemeteries throughout Greece suggests the early emergence of a stratified society in this region.

During the Bronze Age in Greece the art of jewellery-making flourished under influence from the Near East and from Egypt, while also reflecting the unique ideas and inspiration of local craftsmen. Most pieces from this period were discovered in wealthy tombs, where they symbolized authority and prestige. From the Early Bronze Age (c.3200–2000 BC) several fine examples of bronze and silver jewellery survive from the Cyclades, including an outstanding silver diadem from Amorgos, with the top cut in a zigzag pattern, which is now on display in the National Archaeological Museum in Athens. Pendants and necklaces of bone, shell, and semiprecious or ordinary stone were common in the Cyclades. Some gold and silver diadems, earrings, pendants, and pins are also known from a few sites on the Greek mainland during the Early Bronze Age. Also important is a rich collection of jewellery, known as the “Thyreatis Treasure”, in the Staatliche Museen in Berlin, which dates from c.2200 BC and includes an elaborate gold necklace with wedge-shaped pendants. It is thought to come from the Thyreatis in the Peloponnese. The best-known collections of gold jewellery of the Early Bronze Age, however, come from the northeast Aegean, especially from the site of Poliochni on Lemnos and from Troy. The hair spirals, necklaces, pins, and bracelets from these sites are especially impressive for their more advanced techniques, imported from Anatolia, which include filigree and

granulation. Spectacular gold jewellery was also being made on Crete in this early period. The most famous examples from the Early Minoan tombs at Mochlos, now on display in the Herakleion Museum, include diadems made of gold sheet with repoussé decoration and fine chains of gold wire, as well as pins, pendants, beads, and bracelets.

During the Middle Bronze Age (c.2000–1600 BC) important advances in the technique of goldsmithing took place on Minoan Crete and resulted in jewellery of great artistic skill and sensitivity. One remarkable example that uses the filigree and granulation techniques with great effect is the famous gold pendant of two conjoined bees or wasps with a honeycomb (dated c.1700 BC) that was discovered in the Khrysolakkos cemetery at Mallia and is now on display in the Herakleion Museum. Other equally elaborate pendants of gold combined with semiprecious stones belong to the well-known “Aegina Treasure”, discovered in the form of tomb robbers’ loot and now in the British Museum in London. This impressive treasure, dated to the 17th century BC, also includes beads, finger rings, earrings, and diadems of gold as well as gold cutouts in the form of discs with dotted rosettes, which would have been sewn on to garments.

The most remarkable jewellery of the Late Bronze Age (c.1600–1100 BC) comes from the royal shaft graves in the two grave circles at Mycenae, a citadel rightly described by Homer as “rich in gold”. Dating mainly from the 16th century BC, the abundant gold objects from these tombs betray the powerful influence of the Minoan artistic tradition. Indeed, some of them are pure Minoan imports, while others may have been designed by Minoan craftsmen specifically for the Mycenaean market or by Mycenaean craftsmen working from Minoan models. This incredible jewellery, proudly displayed today in the National Archaeological Museum in Athens, includes fine gold diadems (for both sexes) with repoussé decoration; gold cutouts and roundels with repoussé octopuses, butterflies, spirals, and other natural and curvilinear motifs used to adorn luxurious clothing; as well as elaborate pins, earrings, bracelets, armlets, belts, signet-rings, and necklaces of gold, amber, and semiprecious stones.

During the zenith of the Mycenaean civilization (15th–13th centuries BC) the type of jewellery produced throughout Greece (with the exception of Crete) is different in many important respects from its forerunners in the shaft graves and elsewhere. For example, certain types of jewellery, including diadems, pins, and earrings, were no longer popular. Instead, necklaces with relief beads and pendants are very frequent. These beads and pendants are often in the form of stylized floral and marine motifs known from traditional Minoan iconography. The gold beads and pendants were made from gold sheet hammered into stone moulds, filled with magnetite sand, and often

decorated with granulation, enamel (introduced c.1425 BC), grooves, and ribs. Moulded glass paste and faience beads were also used with increasing frequency as well as beads of semiprecious stones in a variety of shapes.

After the collapse of the Mycenaean world around 1100 BC, very little jewellery seems to have been produced in Greece for about 200 years. What little has been discovered from this period is of the simplest form, mainly hair spirals, as well as basic rings, bracelets, and pins, generally made of bronze, occasionally of iron, and rarely of gold that was probably acquired by melting down precious metal hoards amassed from Bronze Age tombs. Between 900 and 600 BC, however, Greek contacts with the more prosperous Near East were renewed and the art of jewellery making was revived, initially in Athens, Lefkandi in Euboea, Corinth, and Knossos, and later throughout the entire Greek world. This early Iron Age jewellery exhibits the reintroduction of sophisticated techniques (e.g. repoussé, filigree, granulation, engraving, and inlaying with stone, glass, and amber), as well as the introduction of newer techniques such as the making of chains and the casting of gold. Forms and motifs of Minoan-Mycenaean jewellery were also reintroduced, though the occasional rediscovered object demonstrates the influence of the arts of Phoenicia and Asia Minor. New Eastern motifs appeared as well, including lions, sphinxes, griffins, and the "Mistress of the Animals", who later became identified with the Greek goddess Artemis. Among the most outstanding objects from this period is a pair of elaborate gold earrings with pendant pomegranates (c.850 BC) that were found in a rich woman's grave on the northwest slope of the Areopagus in Athens and are now on display in the Agora Museum. These earrings were probably made by an immigrant Phoenician artisan who set up a workshop in Athens and passed on his skill to local craftsmen.

Very little jewellery of the Archaic period survives from Greece proper, perhaps because of a shortage of gold that led to jewellery making in less durable materials such as bronze and silver. Spectacular gold jewellery does survive, however, from Cyprus, south Russia, and south Italy, suggesting that Greek goldsmiths were working for foreign customers. After the Persian Wars gold was more common in Greece, and although much of this was reserved for religious uses (e.g. chryselephantine statues), impressive jewellery was also produced. Greek jewellery of the Classical period continues Archaic types and decoration but the orientalizing figures and creatures are generally replaced with floral and geometric motifs (e.g. acorn- and vase-shaped pendants), while mythological themes and figures, such as Aphrodite and Eros, also become more popular. Rich decorative techniques such as granulation and filigree begin to decline

and the simple sculptural forms of the gold are increasingly emphasized. What results is jewellery that is characterized by a more typically Hellenic sense of balance and restraint. Popular forms include diadems, earrings, necklaces, bracelets, and finger rings. Most impressive, however, are the new gold wreaths, with the leaves and fruit of oak, myrtle, olive, and laurel trees, which were received as prizes; worn in religious ceremonies, processions, and banquets; dedicated in sanctuaries; and buried in private tombs as signs of prestige and victory. Two such golden wreaths, one of oak, the other of myrtle, were found in royal Tomb II at Vergina, which dates from the late 4th century BC.

The Hellenistic period is arguably the greatest age of Greek jewellery. There is much surviving material because, for the first time since the Bronze Age, gold was very plentiful in Greece and Macedonia as a result of Philip II's annexation of the gold mines in the area around Mount Pangaeum in Thrace and the dissemination of captured Persian treasures following the eastern campaigns of Alexander the Great. The popular forms of jewellery in this period remained essentially the same with the addition of animal- or human-headed hoop earrings, necklaces with chains terminating in lion heads, necklaces formed of straps with pendant buds or spearheads, necklaces with linked rather than threaded beads, and medallions from the tops of ornamental hairnets that are decorated with high-relief heads of various Greek deities. Most remarkable, however, are the elaborate gold diadems discovered in wealthy tombs throughout the Greek world, which are most often decorated with the new central motif of the Heracles knot (a reef or square knot). This motif had an amuletic purpose as well as a decorative one, was associated with marriage and rites of passage in general, and, more specifically, was a symbol of Alexander the Great that evoked the idea of his kinship with the gods. One of the most elaborate examples of this type of diadem, dating from the 2nd century BC, was found in Thessaly and can be seen today in the Benaki Museum in Athens. The centre of this piece is a richly decorated Heracles knot inlaid with garnets. This decorative use of semiprecious stones as well as coloured glass and enamel was also an important innovation of the Hellenistic period that introduced polychromy into the design of Greek jewellery, thereby transforming its appearance.

During the Roman imperial period the main types of Greek jewellery were continued while their often complex designs incorporating naturalistic elements were gradually replaced with simpler compositions, including semiprecious and precious stones as well as stylized, curvilinear motifs. In the early Byzantine period this more abstract style developed into something quite delicate and

refined, reflecting the well-attested Byzantine taste for expensive and elaborate jewels. The Byzantines were also well supplied, through domestic sources and trade, with gold, ivory, precious stones, and pearls, which were especially popular. Jewellery, meant to convey wealth and status, was produced for all members of the hierarchical Byzantine society. However, gold jewellery with precious stones was generally restricted to the court and to the Church, while poorer members of society might adorn themselves with plain, undecorated finger rings, bracelets, earrings, and buckles made of bronze, glass, brass, or silver. Rich court officials had beautiful signet rings characteristically decorated with complex monograms as well as elaborately worked sashes of office studded with precious stones.

Jews

The Jewish encounter with Hellenic culture has been a continuing phenomenon for the past three millennia. This essay is meant to stimulate new approaches to this encounter from the perspective of Jewish influence on Hellenism. It is with the intellectual fusion of these two unique cultures during the Hellenistic period that the foundations for modern society were firmly laid. This essay will note

the main points of the Hellenic–Judaic helix through two major periods (Hellenistic and Byzantine), and residual influence in the modern period. There will be a brief discussion of the origins of the Hebrew–Hellenic encounter during the biblical period from about 1300 to 300 BC.

The contest between the Aegean migration following the Trojan War and the Israelite survivors of Egyptian bondage lasted throughout the 1st millennium BC: from the period of the Judges (12th–11th centuries) through to the Maccabean period (2nd–1st centuries). During this millennium the fusion had already begun: King David married an Aegean – Ma'akhah (perhaps Maxe/a), the daughter of Talmi (Ptolemaeos), tyrant (*seren*) of Geshur, and perhaps Eglah (better Aigle/a), and his mercenary corps was drawn from Philistines and Cretans. Thus the beginning of mutual influence dates to the first encounters between Hebrew and Hellene in Israel. Compare too the legends in the Book of Judges (compiled late 8th century BC: specifically the parallels between Jephthah's daughter and Iphigeneia, Samson and Heracles, etc.). Greek mythology recalls the Palestinian milieu while archaeology has uncovered the continuity of the Aegean diaspora in Israel throughout the late Judaeen monarchy and the period of the Persian empire. The brief expansion of Hellenism in Israel under the influence of the Ptolemaic and Seleucid kingdoms was reversed by the upsurge of Maccabean nationalism and transmuted later by Hellenized Hasmonaeans. It was only with the establishment of the Roman hegemony that the Hellenic polytheists reasserted their identity; at the same time the way was prepared for their later adoption of Christianity. The ability of the Aegean diaspora to survive the monotheistic revolution of the Israelites during the 1st millennium BC provided one conduit through which the Hellenic culture of Athens was able to penetrate Israelite society.

The historical and cultural background of the Hellenization of the Jews is fundamental to understanding the necessity for the appearance of the Septuagint. In turn, the Septuagint affected Hellenism and the Hellenes through Egyptian-Jewish polemic (e.g. Manetho) long before its appropriation by the Christians. Post-biblical Jewish influence on Hellenism during the period from the 6th century BC to the 6th century AD, which followed post-biblical influence of Hellenic culture on Jews and Judaism, set the pattern for the subsequent 1500 years of western civilization through the autonomous developments within Latin, Greek, and Slavic Christianity, as well as Islamic and Judaic civilizations, the last dispersed among all the former. It was based on a discussion of man(kind) in social, ethical, psychological (i.e. study of the soul), philosophical (i.e. study of wisdom), rational, scientific, and mystical contexts. Here the Jewish concept developed through the

techniques of Greek philosophy and rhetoric to produce an intellectual framework and created the means to “adjust” Hellenism into a monotheistic world view that has sustained western civilization until the present day.

The contacts and mutual influence between the two independent cultures underwent serious change after the conquests of Alexander the Great. The incorporation of the land of Israel and its scattered colonies (henceforth “diaspora”) into a Greek-dominated *oikoumene* (world) necessitated a fusion of Hellenic and Israelite culture if the latter was to survive in the newly defined diaspora which offered to anyone the opportunity to *hellenizein* (i.e. to become a Hellene by learning the language and customs of the conquerors). While the autonomous temple-based culture of Jerusalem and the proto-synagogue Aramaized culture of Babylonia were slow to Hellenize, the Jewish communities of Egypt quickly adapted to the new situation. Widely scattered as part of the administrative and military structure of Persian Egypt, they adjusted to the Macedonian conquest and flocked to the new city of Alexandria. Only fragmentary information is available on the early stages of a parallel process among the Jewish military colonies in Anatolia or the Jewish merchant colonies (metics) in Greece and Macedonia. The widespread Jewish diaspora can be later traced in the Greek translation of Ezekiel (2nd century BC), Philo’s report of his embassy to Gaius (1st century AD), and the peregrinations of Paul of Tarsus (1st century AD).

The Jews acculturated rapidly to the new system, in particular through the adoption of the Greek language which replaced the Persian and Aramaic they had used under the previous empire. Within a generation after the establishment of the Ptolemaic kingdom they were Hellenophone, which caused a problem with respect to their sacred scriptures. Since the middle of the 5th century BC Ezra, a priest and royal scribe at the Persian court, had declared that the five books of Moses comprised their Torah, their God-given teaching (Josephus’ *nomos*). Earlier prophets, such as Jeremiah, had emphasized the teachings of Moses with a stress on ethical standards and the command to remember their God and Zion. In Ptolemy’s Egypt the Jews spoke Greek and so their Torah had become incomprehensible without the mediation of priests and preachers. Hence it was necessary to “interpret” a Greek version for these Jewish Hellenes.

The Septuagint, i.e. the translation of the “Seventy” as retold in the legend of the “Letter of Aristeas” (1st century BC), is one of the seminal phenomena of western civilization. It brought the Torah of Moses and the mythical-legal traditions of the Jews to the wider Greek-speaking world where it became part of the discussion between Hellenes and Jews, both polemically and apologetically, and also provided a means

for syncretism as well as fusion of both Hellenic and Hebrew traditions. The Septuagint then was the Jewish claim to the ultimate historical and ethical truth in the Hellenic (i.e. Greek-speaking) *oikoumene*. Since it challenged Hellenic mythical-poetic traditions and philosophic posturings as did no other representation from the conquered peoples, it provided the intellectuals with a challenge to their own systems. Indeed, the first verse of the Septuagint, which allowed for a future doctrine of *creatio ex nihilo* somewhat different from the original Hebrew, would be at the centre of Christianity's polemic against polytheism and its critique of philosophy and science until the 20th century.

The impact of the Septuagint (the Pentateuch was translated in the 280s BC and the remainder by the end of the 1st century) was threefold. The Egyptian priest Manetho wrote an Egyptian history to show the Hellenes the antiquity of Egyptian civilization and its cult. He also denigrated the Jews in response to the Septuagint's rendering of the Exodus story. To his claim that the Jews were lepers banished to Jerusalem by the Pharaohs, later Hellenic rhetoricians from Alexandria and other schools added negative comments and misinterpretations about the Jews and their cult in Jerusalem. These were all gathered and refuted by a Jewish priest, Joseph ben Matityahu (Josephus Flavius), in his classic apologia *Contra Apionem*, written at the end of the 1st century AD. Yet the Septuagint and translations of the former and latter prophets (Joshua to Kings and the classical literary prophets) as well as other scriptures (both those later accepted into the biblical canon and a host of others) added a wealth of historical and ethical material to support the Jewish world view. In the extant Hellenic literature of the Hellenistic and Roman periods there are as many pro-Jewish as anti-Jewish sentiments, attesting to a perceived powerful and magical secret wisdom among the Jews. And there is the phenomenon of Hellenes converting to Judaism or adopting Jewish ethical teachings, even as the evolving Judaism contributed to the multiplicity of syncretic religions and sectarianism that characterized the period.

Three seminal Jewish figures participated in this process, all three of whom were to become virtual if not actual saints in the Greek Orthodox version of Christianity that became the dominant religion of medieval Hellenism: Philo of Alexandria, Paul of Tarsus, and Josephus Flavius. Philo produced an intellectual synthesis of Mosaic teaching and middle Platonic philosophy that successfully allegorized ancient Hebrew legends and laws into the philosophic language of Hellenistic Alexandria. His extensive corpus of commentaries provided the later Church with the tools and materials that would enable it to Christianize this material for its missionary and didactic missions. Paul

provided a different synthesis. He successfully reinterpreted the northern Mediterranean fertility myths through the language of Pharisaic Judaism into an expanded conception of the Jewish messiah, the anointed one (*o christos*) who would bring salvation to his followers. So Saul of Tarsus, a former Pharisee (biblical interpreter), used his training in the oral commentary to the Torah, which had been further developed through the adoption and adaptation of Hellenistic rhetorical devices, and became Paul, the teacher to the non-Jewish Hellenes of the new chapter in human salvation initiated by the career of a Palestinian Pharisee who had been crucified by the Romans and later resurrected by the God who made heaven and earth (cf. Septuagint, Genesis 1: 1ff). These two near contemporaries, Philo and Paul, thus provided the methodology and ideology for a new synthesis of Hellenistic society and its salvation that was to dominate Hellenism until the present day. Josephus, the third figure, was a priest in Jerusalem who became one of the military leaders in the revolt against Rome (66–73 AD). After his surrender to the Romans, he became tutor to Titus and later a client of the Flavians in Rome where he undertook to write the official story of the Jewish war with Rome (*Jewish War*, 7 books) and to retell the history of the Jews (*Jewish Antiquities*, 20 books). The works of Josephus Flavius were later accepted as a secular (if not divinely inspired) commentary to biblical history by the Christian Church. As such, these works entered the church canon and provided factual and stylistic influence on subsequent theological and historical works among all linguistic varieties of Christianity, in particular Greek Orthodoxy. Indeed, Eusebius of Caesarea is acknowledged by modern scholars to be responsible for the adjustment of Josephus' mention of Jesus of Nazareth into a Jewish acknowledgement of the latter's legitimacy as the Christ, the true Messiah; this was, no doubt, a serious contribution to the "canonization" of Josephus.

Much of the Jewish literature of the Hellenistic and Roman periods was adopted, with appropriate Christianized interpolation, into the library of the new religion. This literature was excerpted by Eusebius of Caesarea and its fragments survive primarily in his massive two-volume apology against polytheism (*Praeparatio Evangelica*) and polemic against Judaism (*Demon-stratio Evangelica*). Other works were incorporated into the canon of the Christian Bible in the 4th century AD which comprised works that, with the exception of the Gospel of St Luke and several letters, were written by practising and believing Jews who had accepted Jesus of Nazareth as the expected Messiah. Even more Jewish material survived as Christian apocrypha. Much of this literature contributed to the Hellenic Church's missionary and didactic policies. Martyrdom, for example, which derived from the

Books of the Maccabees, became central to Christianity before Constantine the Great, and later became the ideology for the militant among Christians and Muslims to the present day. The survival of non-canonized material also contributed to the growth of heresy and to the ongoing questions of the nature and arrival of the promised redemption. It also contributed to the prevalence of magic and mysticism within Christian and Jewish Hellenic society during the medieval period.

Josephus, Flavius ^{AD 37}–after ^{AD 93}

Jewish historian

Flavius Josephus was an important figure in the Jewish community at the time of the disastrous Jewish rebellion of ^{AD 66}–^{AD 67}. Captured by the Romans while commanding part of the revolutionary forces, he was released and treated with honour for the rest of his life after correctly prophesying that Vespasian would become emperor. He then wrote, in Aramaic, a history of the revolt as a warning for Jews in the diaspora. This work, entitled *History of the Jewish War against the Romans*, is lost in the original Aramaic version, but the author later rewrote it in Greek with some help from unnamed Greek assistants, and it became his most influential work and for many centuries the definitive history of the revolt. Josephus then went on to write, this time in Greek, a massive history of Judaism from its origins to his times, entitled *Jewish Antiquities*. This work inevitably covers much of the same ground as the Old Testament, on several versions of which it is largely based, but it also makes use of other traditional Jewish writings and presents the events in a manner influenced by the tradition of Greek historiography. The work also goes substantially beyond the period covered by the Old Testament and in fact overlaps with material covered by the *Jewish War*. In addition, Josephus produced two minor works, an autobiography and a polemic in defence of Judaism known as *Against Apion*.

Josephus' style is not entirely consistent: on the whole his works display a good mastery of the Atticizing Greek used for literary purposes in his day, but occasional semiticisms can also be found. It is unclear how much of Josephus' style is his own and how much is due to the helpers he admits to having employed in rewriting the *Jewish War*, and on whom he may have relied for his other works as well. He tells us that he worked hard to overcome his difficulties with the Greek language and to give himself a solid grounding in Greek literature, but the extent of his acquaintance with the Hellenic tradition has been questioned. The influence of Greek authors such as Thucydides and Polybius can certainly be found in his works, as can a conscious determination to present his story to the educated Greek-speaking world in a manner consistent with, and attractive according to, the rules of the Greek literary tradition. Nevertheless there is reason to believe that the primary influence on Josephus was really the Jewish tradition in which he had been educated.

Despite the occasional infelicity, Josephus' works were praised as stylistic models in the Byzantine period (e.g. by Photios in the 9th century and Theodore Metochites in the 14th century), especially for the vividness and immediacy of his historical narration. They were also imitated by authors such as Niketas Choniates (12th–13th century).

Josephus' main importance for the Greek world, however, is to be found in religious rather than literary history. Thanks to the sanction of Christians such as Origen and Eusebius of Caesarea, in the medieval period Josephus' works became one of the most important historical sources for ancient Palestine. They were copied, epitomized, and excerpted freely and were translated into all the major languages of the medieval Mediterranean. From the 3rd century AD onward Christians saw the *Jewish War* in particular as a sort of continuation of the New Testament, showing the punishment of the Jews for the crucifixion of Christ. Authors such as the chronicler Malalas (6th century), the *Chronicon Paschale* (7th century), and Zonaras (12th century) made use of Josephus, or of works derived from his.

At the end of the Byzantine period Josephus' status as a church historian began to be questioned because of differences between his account of history in the *Jewish Antiquities* and that of the Old Testament, and in the 16th and 17th centuries scholars began to debate the genuineness of a passage known as the "Testimonium Flavianum". This brief section of the *Antiquities* (18. 63–64) mentions Jesus and declares him to have been the Messiah; it seems to have been partly interpolated, perhaps in the 3rd century AD. As this passage was crucial to Josephus' status in the Christian Church (it is probably responsible for the fact that he was the only Jewish historian whose works were entirely preserved by the Byzantines), the debate over its authenticity did considerable damage to his reputation. This debate continued until the 19th century and is to a certain extent still current, though it is no longer crucial to the assessment of Josephus' overall worth as a historian.

For most of the Byzantine period Josephus' works, at least in their Greek form, were essentially the property of the Christian Church and remained basically unknown to the Greek Jewish community. In the 10th century, however, an anonymous historian in southern Italy produced a Hebrew chronicle based primarily on Josephus, and in the 11th century a Judaeo-Arabic version followed. Josephus' works were thus reintroduced to the Jewish community after centuries of use as Christian – and often anti-Semitic – documents.

Josephus remains today an important source of information on Jewish history of the 1st century AD, and his dramatic description of his people's tragic fate is as engrossing to read as ever, but his status

as the inspired creator of an almost sacred text has been replaced by that of a fallible and often biased observer. His Greek style is also less highly regarded than it once was, and his current influence on Hellenic culture is minimal.

Biography

Born in AD 37, Josephus was a Jewish priest and a leading figure in Jerusalem at the time of the Jewish rebellion of 66–67. Though captured by the Romans, he was later released and treated well. He wrote in Aramaic a *History of the Jewish War* (of which a Greek version survives) and in Greek a history of Judaism entitled *Jewish Antiquities*. He died after AD 93.

Judicial Procedure

The earliest written Greek laws were believed to be those of Zaleucus of Italian Locri Epizephyrii (c.650 BC). These were noted for their severity, as were the first written laws of Athens, those of Draco (621/20). Solon’s laws (594/93) replaced Draco’s in all areas except homicide, and the Athenian lawcode was henceforth known as the laws of Solon, regardless of later additions. Under the democracy laws were made in the assembly, and in 410 a revision of the laws was begun. Their inscription on stone led to a distinction between laws (*nomoi*) and decrees (*psephismata*), and from this time decrees of the assembly could not override the written laws, while the framing of new laws was entrusted to groups of “lawmakers” (*nomothetae*).

Athenian laws were essentially procedural rather than substantive. They specified the form of action to be taken against a transgressor without necessarily defining closely the transgression, and sometimes a choice of action was available to the prosecutor. The main categories were public and private actions. In public actions (*dikai demosiai*, but regularly named after the method of initiating the

procedure) the offence was thought to affect the whole community, hence in addition to magistrates and officials it was open to “anyone who wishes” (*ho boulomenos*) to raise an action (i.e. any free adult male, except for those who had been disfranchized, and in some cases excluding non-citizens). The fine or penalty in a public action was paid to the state, but rewards were given to those who successfully prosecuted certain actions, especially *apographe* (deposition) and *phasis* (statement). To deter habitual prosecutors (the original use of the term “sycophant”), in most public actions those who initiated but subsequently dropped a case or failed to win at least one-fifth of the jurors’ votes had to pay a fine of 1000 drachmas and were debarred from bringing similar actions in future (sycophancy was also an offence, which was prosecuted by *probole* – presentation of a case to the Assembly). Public actions included *graphe*, the regular public action (its name will derive from the fact that originally it was in this kind of action that a written charge was made; by the 4th century BC this had become the norm); *apagoge*, whereby the prosecutor arrested the accused (usually a thief caught in the act or a person caught exercising rights to which he was not entitled) and handed him over to the magistrates (regularly the Eleven); *endeixis*, a similar process to *apagoge*, but where the prosecutor denounced the accused to the magistrates and might then arrest him; *ephegesis*, whereby the prosecutor led the accused to the magistrates and they carried out the arrest; *apographe*, in which the prosecutor listed property allegedly due to the state and being withheld (three-quarters of the property would be given to the successful prosecutor); *phasis*, in which the prosecutor pointed out illegal goods or property (the reward here was one half of the fine imposed or of the confiscated property); *eisangelia*, a denunciation to the council or assembly, which might try the case or refer it to a jury court; *probole*, a denunciation to the assembly, which held a hearing and could, if the prosecutor wished to proceed, send the case to a jury; and cases arising from an official’s preliminary examination (*dokimasia*) or his examination after office (*euthynai*).

In private cases (*dikai idiai*, but usually called simply *dikai*) the offence concerned an individual and could only be prosecuted by the person who alleged he had been wronged. If successful, the private prosecutor would be awarded damages or compensation. In *diadikasia* two or more persons disputed a right (especially to an inheritance) or obligation (such as to perform a liturgy) on equal terms. A special form of case was homicide (*dike phonou*), in which the relatives of the deceased were required to prosecute, but the offence concerned the whole community since killers were polluted. Hence the alleged killer was debarred by a proclamation from sacred and public places, three pre-trial hearings were held instead of the usual one, particularly

solemn oaths were sworn, the trial itself was held in the open air in one of the special homicide courts, and the parties were each allowed to make two speeches, again instead of the usual one.

Suits were initiated by the prosecutor submitting his charge to the appropriate magistrate and delivering the summons to the defendant. The eponymous archon presided over cases involving the family and inheritance; the *basileus* (second archon) was in charge of homicide and religious cases; the *polemarchos* (third archon) oversaw cases involving non-citizens; the *thesmothetae* (the six junior archons) managed a wide range of cases in their court, the *eliaia*; the Eleven (police commissioners) were in charge of cases involving theft and similar offences; the generals conducted cases of military offences; and there were some lesser boards of magistrates for specific types of case. In the 4th century most private cases came before the Forty, four judges from each of the ten tribes selected by lot. The magistrate heard statements and evidence at an inquiry (*anakrisis*) and could settle minor cases himself, but otherwise would decide if the case should be sent to trial. In a private suit the accused might object that an incorrect procedure was being employed (*paragraphe*), and this would have to be decided by a separate hearing before the action itself could proceed. A trial in a private case before the Forty might be avoided by resorting to binding arbitration, a procedure that existed from earliest times in many Greek states and became particularly widespread during the Hellenistic period. Private and (in cases involving claims for more than ten drachmas) public arbitrators were used, but their decisions were appellable to the courts.

Trials in the 5th and 4th centuries were conducted in the popular jury courts (*dikasteria*). A panel of 6000 jurors over the age of 30 was selected each year, and Pericles introduced jury pay (two, later three obols per day). The size of the jury varied according to the type of case, but regularly numbered several hundred, and in order to prevent bribery jurors were allocated to the different courts by a lot system which became increasingly complex during the 4th century. The magistrate who had received the charge now presided, but did not act like a modern judge in giving directions or advice. Litigants were expected to represent themselves unless clearly unable to do so, but might call on friends to speak on their behalf (*synegoroi*); women and children were represented by their nearest adult male relative. The prosecutor was followed by the defendant, each making one speech which might have been written for him by a professional speech-writer (*logographos*); in the course of the speech laws and other documents might be read out by the court clerk, when the water-clock which timed the speech was stopped. Witnesses, who tended to act as supporters for the parties rather than as suppliers of information, gave

evidence orally until the early 4th century and could only be questioned by the litigant who summoned them, but after this time written evidence was used and witness merely acknowledged the text was theirs. The disfranchised, women, and children could not appear as witnesses, and slaves' evidence was only accepted if extracted under torture and by the agreement of both parties (which in practice rarely if ever happened). The jurors had to cast their votes immediately after the speeches, with no summing-up from the magistrate or time to retire for consideration of their verdict. The original system of putting a pebble into one of two urns (one for guilty, one for not guilty) was replaced during the 4th century by a procedure in which each juror had two bronze votes, one of them with a hole to signify guilty, and the votes were cast one into a bronze, "valid" urn, the other into a wooden, "invalid" urn. The verdict was arrived at by a simple majority, with a tie counting as an acquittal (though by the 4th century odd numbers of jurors were used). There was no right of appeal, but the losing party might win compensation from a witness who was proved to have given false evidence, or occasionally have the case reopened. Penalties were either fixed by the law or decided by the jurors, according to the type of suit; in the latter case the two sides made further speeches proposing alternative penalties which the jurors would vote on. Monetary fines were the most common remedy, and other penalties included death, exile, the stocks, full or partial disfranchisement (*atimia*), and confiscation of property. Unlike in modern penal systems, imprisonment was used sparingly as a punishment.

Athenian law had little or no significance in the development of later legal systems, and reasons for this are not hard to find. The lack of a body of substantive law, in glaring contrast with the extensive Roman system, is the most obvious one, the absence of any doctrine of binding precedent another. But there cannot be precedent when every sitting of every court is the supreme and unaccountable representative of the democracy, and that is the point. The decisions of the dicasts were ephemeral, prone to be swayed by the clever speaker at the expense of truth; but the courts, with their large juries, *were* the people for the litigants appearing before them, and the popular jury system lay at the very heart of the Athenian democracy.

K

Kalamata

Port in the southern Peloponnese

Excavations have shown that Kalamata occupies the site of ancient Pherae which is most likely identified with the Pherae of the Homeric poems. In the *Iliad* “sacred Pherae” is one of the seven cities “on the border of sandy Pylos” that Agamemnon offers Achilles, hoping to persuade him to take up arms again (9. 149). According to the *Iliad* (5. 541–53) this Pherae is inhabited by Diocles and his sons, who set out for Troy to gain honour for the Atreids. In the *Odyssey* (3. 488 and 15. 186) Telemachus twice visits Diocles in Pherae on his way from Pylos to Sparta and back.

The status of Pherae in this period is not clear. A Linear B tablet (An 661) from Nestor’s palace at Pylos may throw some light on this matter. It says, apparently in a case of emergency, that 30 members of the coast guard are to be sent to the Nedon. This river, and consequently Pherae, seem not to have been part of the area ruled by the palace, because the kingdom’s coast was already occupied by guards.

The overall picture seems to indicate that Pherae did not strictly belong to the kingdom of Pylos, nor to Sparta. Situated “on the border of sandy Pylos” here apparently means on the other side of the border, because Nestor did not oppose Agamemnon when the seven cities were offered to Achilles. He would not have been so friendly if Agamemnon had been about to give away seven Pylian cities. The marshes of the Pamisos estuary in the lower Messenian plain could well have formed a natural border between Pylos and Pherae. But Pherae was not a kingdom itself, as stated by Homer, who never calls Diocles and his family kings, but just inhabitants of the city. The participation of Diocles’ sons in the Trojan War in the regiments of Menelaus seems to indicate some degree of dependence of Pherae on Sparta.

In the 8th century ^{BC} Pherae was annexed by the Spartans, who kept dominion over the city until 371 ^{BC}, when the Thebans liberated Messenia. Pherae again fell into Laconian hands after the battle of Actium in 31 ^{BC}, when Augustus donated the city to his Spartan allies. Tiberius (^{AD} 14–37) in his turn assigned the cities on the western flank of Mount Taygetos to Messenia. According to Pausanias (4. 30. 3), Pherae was an ancient medical centre. He writes that Diocles’ daughter Anticleia married Machaon, the illustrious son of Asclepius.

Their descendants remained in Pherae, and with them the power of healing diseases and curing the maimed. Pausanias refers to a sanctuary of Machaon's sons in Pherae and his tomb in Gerenia (modern Kambos).

Kavalla

Port in eastern Macedonia

In contrast to other towns of Macedonia which clearly have a medieval past, collective memory of Kavalla extends only as far back as the period of Ottoman rule. This does not, however, reflect the true situation, since the site was settled in antiquity. The ancient predecessor of Kavalla, Neapolis, was a colony of the Thasians, on the coast opposite their island, and existed at least as early as the 5th century BC, when it was included in the tribute lists of the Delian League. The site combined several geographical and strategic advantages. First, it controlled the narrow pass between the Lekani mountains and the sea which the land route from Macedonia to Thrace (the ancient Via Egnatia) necessarily had to pass through. Second, it provided access to and control of the gold-mines of Mount Pangaeum and the productive plain of Philippi/Drama. And third, it served as an outlet to the sea for the products of those regions. The importance of Neapolis was underlined when it served as the port of Philippi, 15 km to the northwest, throughout its long period of prosperity. Neapolis was renamed Christoupolis, probably in memory of St Paul's disembarking there as he began his tour in Macedonia. By the 9th century the ancient name of Neapolis was probably completely forgotten.

Kinship

The Greek words for “kin”, *syngeneis*, and for “relationship”, *syngeneia*, are compounds of the preposition *syn* and the word *genos*, whose usage is manifold in Greek to denote “genus”, “category”, “lineage”, “family”, “generation”, “stock”, etc. *Syngeneia*, then, means “common stock, generation, or lineage”. The term, in its broadest sense, is used to define relationships by consanguinity (*ex aimatos*) or affinity (*ex anchisteias*). Consanguinal relations, however, are considered as closer than those established through the sexual tie of marriage since in consanguinity relatives are thought to share the same substance, that of blood.

Rural and traditional Greek society has often been presented in the anthropological literature as a society overwhelmingly based on kinship. Scholars have singled out the family as Greece’s most important social institution and pointed out that kinship pervades all aspects of traditional Greek social life. Kinship constitutes the basis for economic cooperation, political negotiation, and participation in ritual. Its role in the construction of personhood and gender identities is central. Although it can be argued that the urbanization and modernization of Greek society have caused the weakening of kinship ties, kinship still continues to influence social relations on many levels. Nepotism, kinship-based patronage, and formal financial partnerships formed among kin are not uncommon phenomena in the urban context.

The stress on the significance of kinship in the Greek social context is not only confirmed by studies of modern Greece, but also by those of the Classical and Hellenistic periods. The oeuvre of Greek dramatists amply demonstrates the crucial part played by kinship and family in ancient times. There is an observable tendency among Greeks of all periods to define themselves in terms of kinship connections; the ancient Greeks even based political requests and affiliations on real or fictitious kinship ties. Indeed, there is much evidence that shows the immense moral and political importance that the ancient Greeks attached to ancestry. Descent was often traced from a solitary figure, preferably going back to the traditional heroes or deities of Greek mythology. However, it should be pointed out that most of the information available on kinship in antiquity comes from Classical Athens. Generalizations are therefore problematic, and what

follows is a synopsis in barest outline.

S.C. Humphreys distinguished four overlapping institutional kinship groupings in ancient Greek society: the official subdivisions of the state (tribe, phratry, deme, and so on), *genos*, kindred, and household. Each of them was characterized by its own structural principles, rules, and patterns of behaviour. Tribes and phratries were the main components or divisions of the citizen body. They functioned as administrative and military units. Membership of them was hereditary and obtained by patrification. Every native-born Athenian male belonged to a phratry, which was a social group over and above the family, responsible mainly for dealing with questions concerning descent, access to citizenship, and inheritance rights. Members of phratries were known as *phrateres*, a word whose meaning is close to that of “brother”. Women were usually denied rights of membership to them, but there were cases where women were presented to the phratry of their father or husband. The internal construction of phratries consisted of a variety of subgroups such as the *thiasoi*, responsible for internal political processes of the group, the *genos*, and others. It has been argued that the phratries were themselves subgroups of the Ionian tribes, which were abolished by the new system of Cleisthenes (507 BC). However, this argument rests on a thin base since phratries continued to be functional even after the introduction of the new system, which consisted of tribes and their subdivisions: *trittyes* (“thirdings”) and demes. In Athens, each tribe comprised three *trittyes*, one each from the city, shore, and inland regions of Attica, which were divided into ten *trittyes* each. In turn, each *trittyes* contained between one and ten demes (in Athens there existed 139 settlements, villages, or town-quarters) and a fixed number of phratries. Hence, Cleisthenes created a ten-tribe structure, each tribe taking the name of a local hero and having a hereditary membership recruited along the male line. Thus, tribes, *trittyes*, demes, and phratries were all patrilineal clans and subclans, which, however, were not genealogically structured as was the case of the Greek patrilineal *genos*.

The *genos* was a kinship institution concerned mainly with aristocratic dominance of the succession to priesthoods. Its earliest use was to denote noble lineage, but in 4th-century BC Athens the term was employed to designate those individual or family groups that had a common plural name, usually derived from that of a genuine or fictive male progenitor. The stress, therefore, was on descent and the *genos* had the structure of a “conical clan”. There is evidence suggesting that *gene* were phratry subgroups with a form and function different from phratries and thus not identical to them. Although *gene* were primarily concerned with retaining rights to hereditary priestly office, not all of

them were concerned with religious privileges. The larger *gene* showed a variety of other interests relating to common property and admission.

Greek kindred in antiquity was bilateral, extending to second cousins and giving rights to inheritance by the laws governing intestacy. Moreover, marriages between close male kin and *epikleroi* (fatherless heiresses) were encouraged by the Athenian epicle rate. However, marriage in the kindred was restricted, but such impediments varied over time and space. An Athenian woman could not normally be married to a direct ancestor or descendant, nor to a sibling by the same mother (a practice known in Sparta). Yet, marriage between siblings of the same father or to an uncle or a cousin was allowed. As far as kinship solidarity is concerned, it can be shown that the power of kinship to function as a structural principle of action beyond the bounds of nuclear family was limited in the urban context of the Greek city. Kinship ties did not play an important part in the relationships of Athenian citizens, and political and economic cooperation with kinsfolk was no different from that between friends. In fact, kinship ties were often considered burdensome and dangerous rather than supportive.

The smaller kinship group in ancient Greece was that of the *oikos* (household). The concept of the *oikos* incorporated not only its physical reality, but also designated a group of people who co-resided and were mostly – but not entirely – connected by kin ties (including affines). Finally, it even applied to property, land, and animals as well. Although, from Homeric times onwards, the nuclear family appears to have been the most common residential and economic unit, stem and extended families continued to exist. The circle of kin contained in such units included unmarried female relatives. Labour requirements were often met by the co-residing non-kin household members such as slaves. The emerging picture of the organization of kinship in the household setting is one that exhibits a patrilineal bias since postmarital residence was patrilocal: the bride moved into the groom's house after marriage. Though both matrilocality and patrilocal residence were a historical reality in Greek society and may have coexisted in the Bronze Age, after Homer the system tended to patrilocal marital residence and partible inheritance of property. In the household unit the man was the *kyrios* (head of household) and acted as such in the public domain. In the Homeric era a man's prestige was completely bound up with his *oikos*. In Classical Athens, however, men became more concerned with public institutions. For this reason, the acquisition of prestige became less *oikos*-centred and more directed towards public contexts.

In Byzantine society the term *syngeneia* was used to denote the

family, which by the 8th century was primarily a nuclear one, as well as kinship relations beyond the family unit. From the end of the 11th century we have evidence for the emergence of lineages and for manipulation of ties of kinship in politics. However, unlike the Roman *gens*, Byzantine lineages were not strictly patrilineal and there is no evidence for an organizational structure to lineage and common landownership. The closeness of kinship relations was established by the degree (*vathmos*) of relationship, which was calculated down both collateral lines, beginning with the first births from the original parents and thus arriving at the second degree for two siblings. This reckoning of the degrees of kinship was important for determining marriage prohibitions and rights to inheritance. From the 11th century onwards a restriction of seven degrees appears to have been the prevailing rule adopted by Byzantine law and the Church, which forbade marriage among all blood, adoptive, and spiritual relatives to that degree of relationship and a limit of six degrees for those related by marriage. The rights of kin to inheritance were also determined by the degree of relationship to the deceased. In the case of *ab intestato* succession, from the 6th century onwards the general rule prevailed that all male and female relatives of the same degree of kinship had equal inheritance rights.

The marriage impediments established in Byzantine times are part of Greek Orthodox canon law and are still in force in modern Greece today, though native versions of calculating degrees of kinship are found in many communities. Modern Greece, by most reckonings, is characterized by a bilateral kinship system with a patrilineal skewing or bias that is revealed in various contexts and occasions. In Greece the bilateral form of the kindred is also reflected in terminology. The word for “kindred” is *soi* and refers to one’s relatives both through the father and through the mother. Also, we can note the absence of separate terms of address for paternal and maternal relations outside the family.

Yet, it can be argued that modern Greece involves two distinct cultural traditions differing in kinship structure. Such differences are related to distinct modes of organizing post-marital residence, production, transmission of property, names, and reputation. The first cultural tradition is primarily associated with the pastoral and agricultural communities of mainland Greece. Their mode of production dictates an agnatic emphasis in kinship, a bias towards patri-virilocality, and promotes the submissiveness of women. Thus, in such societies brides would join their husbands’ households upon marriage, while married sons would either co-reside with their parents or live close to their natal households. Property, names, and reputations are all transferred from father to sons. Yet, it should be

pointed out that from the 19th century patrilineal corporate groups were a phenomenon in decline. In Mani the war towers reveal the existence of patrilinealagnatic clans consisting of all patrilineal descendants of an apical ancestor. Each clan was further subdivided into *genies* (lineages), which branched off to smaller lineages, and these in turn to extended or nuclear families. The Maniot naming system is central to the processes of segmentation, fissioning, and clan formation. Each extended family household of a patriclan takes its surname from the first name of an apical ancestor, while the firstborn sons of male siblings take the first name of their grandfather. Other communities that have a bilateral kinship system with patrilineal overtones are the Sarakatsan shepherds, the Vlachs, and the shepherding communities of Crete. Finally, the agricultural communities of Euboea, Boeotia, and the Ionian islands also practise virilocality. Yet, their kinship system is characterized by a less strongly marked patrilineal bent compared to the societies mentioned above.

The second cultural tradition, which differs in the organization of kinship from the main body of Greece, is that of the Aegean islands. Its main characteristics are matrifocal kinship ties, the uxorilocal residence pattern, where the couple settles in the vicinity of the bride's kin, the rule of house inheritance by women, and the transmission of property and names through both lines, from mother to daughters and from father to sons. Thus, in such communities the kinship structure is characterized by a matrilateral bias, which promotes a comparatively privileged female position and the formation of nuclei of matri-laterally related women (mother and sisters) playing an important role within both the family and the community. This phenomenon should also be linked with the absence of men for long periods of time due to their sea-related occupations. In between these two types of communities there are others that practise neolocality, where each nuclear family resides in its own dwelling and has a fully bilateral kinship system.

In the Greek understanding of kinship there is a clear distinction between blood ties and affinal ones. In the physical world blood relations are considered stronger since they create a natural union among living kin. In the spiritual world, however, blood is substituted by another life-giving substance, that of oil to create a spiritual relationship (*pneumatiki syngeneia*), which is likened to kinship. This relationship is known in Greek as *koumparia* and is established by the sacraments of baptism or marriage. In many areas of Greece it is customary to renew the relationship, which is inherited through the male line. The godfather of the groom, and not of the bride, becomes their wedding sponsor. This may be regarded as a consequence of the

patrilineal bias in kinship. Apart from its spiritual function, godparenthood has also acted in the Greek context as a powerful vehicle for strategic alliances, political recruitment, and patronage. Today, however, in the urban context we notice the tendency of selecting godparents from within the circle of close kin or even from within the family itself.

Another form of ritual kinship that existed in the Greek context, but did not endure to the present time, is that of blood brotherhood (*adelphopoia*). Blood brotherhood appeared in Greek society after the conquests of Alexander the Great. While in the beginning the tie between two people was established through the symbolic exchange of blood, later on, with the spread of Christianity, this symbolic act was replaced by the prayers of a ritual. There were repeated prohibitions against *adelphopoia* by the Orthodox Church. Nevertheless, the practice remained widespread in many areas of rural Greece up to the civil war. Its social function was to cement friendship, especially in communities where vendettas were common, and carried with it an obligation of mutual help and support. A marriage impediment existed for those belonging to families that were related by blood brotherhood.

Adoption is also regarded as a form of fictive kinship and in Byzantine times became a spiritual relationship, like that of godparenthood, with which it shared similar marriage prohibitions. Adoption was practised when a childless couple or a couple that had no male children desired descendants and heirs. In antiquity we find the institution of the transfer by adoption of one son from a household with several male heirs to the family of a close kin with none. This practice has continued in Greece up until recent times, particularly in communities with agnatic descent, as a means of continuing the family line and perpetuating the family name.

Finally, secular kinship serves as a model for structuring other types of social relations, such as those between superiors and monks or nuns, and between confessor and confessant. In Byzantium kinship terminology was also used to describe the relation of the emperor to his subjects and to foreign Christian rulers.

Knossos

Urban settlement and palatial centre in Crete

Knossos lies in the centre north of Crete, two hours' walk from the sea: set amongst low hills, on fertile marly soil and well enough watered. This was a combination that attracted the Neolithic settlers, around 7000 BC, and led to their creating over the next three millennia a substantial tell and the largest of their settlements on the island. Knossos occupied a position of importance, even pre-eminence, seldom surrendered throughout its subsequent history.

Archaeological exploration has revealed that its finest period was as a palatial centre of the Minoans in the Bronze Age (3500–1000 BC), known even then as Knossos. Its rise was gradual, though by 2000 BC (EM III/MM I) the settlement was nearly as extensive as it ever was and already centred on a monumental structure, now replaced by the First Palace. About this extended the town, apparently unfortified, and with cemeteries developed especially to the east and north: it was a “capital” of one of several regional groupings, perhaps jockeying for wider power. Knossos seemingly achieved this c.1700 BC (MM III), when the Second Palace was erected: its prosperity and vigour were shared islandwide; Minoan dominance was evident in the Cyclades and culturally influential in southern Greece. This frenetic burst of activity may have overtaxed the resource base on which it depended: events and reasons are still disputed, but c.1450 BC (LM Ib) much of the island was destroyed in fire and smoke. When this had cleared, power at Knossos was exercised much as before, but now by an elite with a distinctly Mycenaean flavour: changes were expressed in ceramics, dress, weapons; iconographical themes, stylistic renditions; burial types, customs, and locations; and most significantly by the adaptation of the Minoan administrative system and syllabic script, now utilized to express Greek (Linear B). Their control was maintained at least to 1375 BC (LM IIIA1), when a fire ravaged town and palace. Some scholars see this as the end of the Mycenaean control; others prolong their existence well into the 1200s BC (LM IIIB). Either way, the town did survive, at a much-reduced scale, with a simpler, if comfortable, standard of living (LM IIIB) before fading into the very troubled times of the 12th century BC (LM IIIC).

Continuity was somehow maintained in this transitional period: Dorian cultural traits became dominant in this region of Crete. The

important early Iron Age cemeteries (11th–7th centuries BC) north of the Bronze Age town indicate this by their use of a Late Bronze Age burial ground, by its rapid expansion, and by the complex burial customs and quite lavish grave goods, with overseas connections visible. Sanctuaries were built over part of the Bronze Age settlement. This flourishing community, with its horse-owning aristocracy, can be traced down to the late 7th century BC, when the evidence dwindles dramatically. The implication is that the polis of Knossos was in decline. Reasons have been sought in military defeat (by Lyttos), plague, and famine. For the Classical period (5th–1st centuries BC) much of the piecemeal evidence comes from literary and epigraphic sources: stasis in the 470s, federal relations with neighbours, migration of ambitious citizens (athletes, architects, and lawgivers) to more progressive milieux. Crete remained peripheral to the Persian and Peloponnesian Wars. By the time of the rise of Macedon, Knossos was populous, to judge from the size of the famine relief donated by Cyrene from 330 to 326 BC. Like much of the Greek world, Knossos was dragged by political manoeuvring into the wider hostilities of the time: internal feuds with Lyttos brought in Phocians and Spartans, and Alexander's campaigns against Darius saw many Cretans dragooned into fighting on the Persian side.

Once released, the genie of military aggression proved to be beyond control. Knossos pursued political domination in the Hellenistic period (4th–3rd centuries BC), more by a network of alliances than outright conquest, though there were exceptions. Knossos' eminence in this struggle is indicated by the island-wide spread of its league, by which it hoped to neutralize more local coalitions. Success was achieved initially: Lykastos, for example, was reportedly razed to the ground; Lyttos fared badly in the war of 221–219 BC; Apollonia and Rhaukos became victims in the early 2nd century BC. But there were setbacks too: a defeat (184 BC) by Gortyn foreshadowed a series of damaging campaigns between these two eminent cities into the 1st century BC; Lyttos grew strong again. Knossian troops were also active abroad as mercenaries, generally staunchly anti-Macedonian.

The Roman incursion (1st century BC) produced one Knos-sian hero: Lasthenes, who won a sea battle, for which success his house and property were destroyed at the final Roman conquest (69 BC). Gortyn, however, became the premier city, initially in the combined Roman province of Crete and Cyrenaica. After the confusion of the civil wars with Antony, Octavian created the Colonia Julia Nobilis Cnossos in 27 BC. Latin names (settlers from Capua?) feature now in the magistrates and priest-hoods. Knossos became a typical Roman provincial city: rebuilt after a series of earthquakes in the early to mid-1st century AD, the colony enjoyed a long spell of prosperity, as well-appointed

houses, some rich tombs, and public works (aqueduct) attest. A further major quake in the mid-4th century AD cut this short.

Not that Knossos was ever exactly forgotten. The town makes regular, if relatively uninformative, appearances in Classical to Roman sources (often in historical or philosophical contexts): Nero was fooled into believing that a cache of tablets (Linear B?) told part of the story of Aeneas' flight to Italy. The Roman ruins were visible for centuries.

Rather the focus of attention has always been more firmly fixed on its Bronze Age past, translated into myth and legend. This process was under way by the 8th century BC, when the island and its peoples played a peripheral part in Homeric epic.

Inevitably, Minos and his court attracted most attention. The positive aspects of his character (as a respected judge in this and the next world; the special relationship with Zeus; and as brother to Rhadamanthys the lawgiver) sit a little at odds with his crueller, imperial side (feuds with Athens, control of the seas, conqueror and dynastic manipulator throughout the Cyclades). His nemesis came upon him in the shameful form of the Minotaur, his downfall at the hands of Theseus, and his death in Sicily from betrayal and an over-hot bath. Daedalus, Icarus, the Labyrinth, Glaucus, Ariadne and Talos are other characters that figure in the same circle of stories. All remain potent icons and symbols, tapped into by today's Greek artists and intelligentsia, and regarded with justifiable pride by modern Cretans.

L

Laconia

Region of the southeastern Peloponnese

The district of Laconia – Homer’s “hollow Lacedaemon” – occupies the southeastern part of the Peloponnese, around the valley of the river Eurotas. To the west is the mountain range of Taygetus, the highest in the Peloponnese, whose summit is usually snow-covered at least into May. To the east is the Parnon range, which runs southwards to the peninsula of Malea. In the Homeric poems this is the homeland of Menelaus, brother of Agamemnon and husband of Helen whose abduction by the Trojans was the whole cause of the siege of Troy. Menelaus is the second-rater, after his brother, of the Argive kings, which would lead one to expect in Laconia a Bronze Age palace and citadel comparable with that at Mycenae, and at least the equal of the “Palace of Nestor” in neighbouring Messenia. If such a palace existed, it has not been found, though, adjacent to a natural mound on which in Classical times the shrine of the deified Menelaus and Helen was situated, there is a sequence of Late Bronze Age structures of some quality, not, however, palatial in scale. This, like other Mycenaean sites in Laconia, was destroyed about 1200 BC, at which point Laconia relapsed into total obscurity and, it would seem, was largely denuded of its population.

At least two centuries later, and probably not before the middle of the 10th century BC, Dorian newcomers settled in the upper reaches of the Eurotas, about 50 km from the sea, opposite the site of the Mycenaean buildings, but on lower ground. Here they formed a group of villages which collectively became the Classical city state of Sparta though, as Thucydides famously pointed out in the introductory chapters of his *History*, even at the end of the 5th century BC physically the city remained nothing more than a collection of villages. Four of them formed the city itself, while a fifth was politically part of the same city state structure, at Amyclae, a short distance to the south. The institutions of the Spartans, similar to those of the Dorian settlers in Crete, remained notoriously distinctive and primitive through the Classical period. They retained, almost to the end of their independence, a curious dual king-ship, the reasons for which can only be guessed at. The purpose of these institutions was to create and sustain a military elite, the Spartiates, who alone had full citizenship rights, and with this to establish and maintain a supremacy which was extended, probably by the end of the 8th century BC, over the whole of

Laconia, and in the following century crossed the mountain boundary of Taygetus to incorporate Messenia. Outside Sparta the population of Laconia comprised two categories: the Helots (a term which probably denotes that they were “prisoners”), who worked the land – to which they were tied – on behalf of Spartiate landlords, who were thus freed from labour to pursue their military functions; and the *perioikoi*, the “dwellers round” who were free, living in their own communities, but subject to Spartan control and under an obligation to render military support when called on to do so (the same distinctions were extended into conquered Messenia).

The land round Sparta is extremely rich agriculturally; fertile alluvium, well watered by streams fed by the melting snow on the mountain, running into the Eurotas and making it a river which continues to flow throughout the summer. For this reason, at the present day the district has suffered less than most parts of Greece from rural depopulation – with virtually all basic commodities produced locally there is less incentive to migrate to Athens. Conversely, the promontory at the southern end of Taygetus, the Mani, is desperately poor land, with much consequent migration, particularly to Australia. It was undoubtedly the wealth of the land round Sparta that led to it becoming a major city of Classical Greece, though situated at such a distance from the sea.

The communities of *perioikoi* were more varied. Some, like Geronthai (modern Geraki) southeast of Sparta, had long antecedents, but being in areas with poorer agricultural resources could never achieve the power of Sparta, and were satisfied to be part of the Spartan system (conversely, the reason they were not reduced to Helot status was probably that their land was less desirable to the Spartans). Other such communities served more specialized functions, the most important of these being Gytheum, which was the chief harbour town.

Despite being so far inland, Sparta experienced the same artistic development as the other leading areas of Greece in the 8th and 7th centuries BC, resulting from the renewal of overseas trade. Goods imported from the Near East are found there, while Laconian pottery evolved into a distinctive style, after the dull wares of the Dark Age, and was exported to north Africa (Cyrene) and south Italy, where Taras (Tarentum, modern Taranto) was a Spartan colony. There is good evidence for the development of Spartan poetry, and the creation of the shrine to Menelaus and Helen, the Menelaion, on the mound which looks as though it were their tomb (though in reality it is a natural outcrop of rock) shows that the Spartans of the 8th and 7th centuries were well aware of the Homeric poems and the story of the siege of Troy. It was probably the difficulties of maintaining control over rebellious Messenia – another source of wealth – which in the

later 7th and 6th centuries caused the Spartans to turn their back on this development, and reinstate with great rigidity (to the curiosity of progressive Greeks, such as the Athenians) the primitive militaristic training and regime for which they became notorious.

After the defeat of the Spartans by the Boeotian League in 371 BC, and the consequent loss of Messenia, Sparta dwindled in political importance; but the potential strength of Laconia was realized once more, after 150 dormant years, when king Cleomenes III carried out a redistribution of the land, and so recreated a substantial citizen army, only to be defeated by the Macedonian army of Antigonos Doson.

In Roman times Laconia became a quiet backwater, enjoying some imperial and other external patronage. Substantial theatres were built at Sparta and Gytheum, and the mosaic pavements of Spartan houses attest to a comfortable standard of living. In the troubled later Roman period fortifications, incorporating the theatre, defended only a reduced area. The city was sacked by Alaric in AD 396, but survived, though the later habitations built over the theatre are wretchedly squalid. Laconia, however, remained a vitally important area, though in the Middle Ages the centre of interest shifted to Mistra, the stronghold city on the foothills of Taygetus. Originally a Frankish foundation, Mistra was recovered by the Byzantines, and blossomed as a centre of late Hellenic culture, where George Gemistos Plethon's teachings took Platonism as the means to emphasize an intellectual continuity from the Classical world. Mistra, in turn, dwindled under Turkish occupation, though still equipped with a splendid series of late Byzantine churches. With the freeing of Greece after the War of Independence, the attempt to recreate the Classical cities led to the redevelopment of a modern city on the approximate site of Sparta. With its inevitable grid plan of streets, and an imposing Neoclassical town hall, splendidly restored in recent years, Sparta remains a relatively small but very prosperous market town for Laconia, whose good land now grows citrus fruit in abundance (the small town of Hagios Stephanos has an annual Festival of the Oranges): the perioikic land of Geraki is devoted largely to olive groves.

Land Tenure

Throughout the history of the Greek people access to use and ownership of arable land has been a central concern. The classical polis restricted land ownership to those who were citizens and, more often than not, refused full political rights to those who were too poor to own land. In the countryside the transition from ancient civilization to Byzantium was marked by the gradual disappearance of the small freeholder who worked his plot with the assistance of chattel slaves, and the spread of a class of technically free persons who were only conditional cultivators of the property of large landholders. Increasingly exploitative practices under the Ottoman rulers resulted in the virtual depopulation of many areas of rural Greece, and it was not a simple matter for the first post-independence governments to create the conditions under which land could be distributed and made productive again.

In exploring the question of land tenure from the 8th century BC to modern times certain issues keep recurring. Could one alienate land? What laws of inheritance applied to land? Does the payment of taxes or rent imply a less than full ownership of the land? In addition to exploring these rather legalistic issues, one must also keep in mind a recurring theme in Greek beliefs about landholding: the most desirable state of affairs is for all citizens to have roughly the same amount of land. Social and legal mechanisms which tend to work against the formation of large estates are a stated goal of lawgivers and political theorists at least until the 4th century BC.

The earliest Greek writer to deal specifically with these questions is Hesiod. At the very end of the 8th century BC he composed *Works and Days*, a didactic poem addressed to his brother Perses. Hesiod covers a wide variety of subjects as he lectures Perses, but his central complaint involves land ownership: his brother has snatched most of their joint inheritance with the connivance of "bribe-eating lords", in

spite of their private, apparently more equitable, agreement. In view of this, and his advice later in the poem to have only one son (in order that the family's wealth should grow), it is clear that in Boeotia of Hesiod's day it was the practice for all sons to inherit a part of their father's land. He also makes it clear that land could be alienated when he promises that, if Perses follows his advice, he will be able to buy the land of other people, instead of seeing his own land bought up by others. Finally, the complaints against the corrupt officials indicate that by the 8th century such disputes could be taken to an authority outside the family.

Evidence for Archaic and Classical Greece is far more abundant, but often confusing and contradictory. Both the 7th and 6th centuries BC and the 4th to the 2nd centuries BC were eras of widespread civil strife in many poleis, where conflict centred around disparities in wealth. Therefore, later writers tend to reconstruct earlier conflicts in terms of contemporary conditions. In the case of early 6th-century Athens, for example, Solon was appointed archon to deal with the crisis of debt bondage. Although this much is certain, the genesis of the crisis, its exact nature, and the content of Solon's legislation remain the subject of considerable dispute. Solon's own words about his aims and how he viewed his accomplishments in his legislative programme have survived, but as poems, not official documents. Adding to the confusion are various 4th-century sources which tried to coopt Solon's legacy in support of their own oligarchic or democratic philosophies. Any modern attempt to reconstruct the situation which Solon faced and how he dealt with it must take into account his own statement that, while he did cancel debts, he did not redistribute land, though some apparently expected him to do so. Current opinion holds that the land which the poor worked as sharecroppers was either their own land which they had been forced to mortgage (Burford, 1993, p. 51) or public land which had been commandeered by the wealthy (Rihll, 1991, pp.123–24). Solon in effect gave this public land back to the community, allowing the cultivators to become the owners. He is also credited by ancient writers with making it illegal to alienate one's inherited plot. The alienability of land in Classical Athens continues to be a controversial topic among scholars. On the one hand, there are specific cases of land being sold by at least the late 5th century, and on the other hand, there was obviously great social pressure against sales of this kind. The law of Athens went to great lengths at times to ensure that land would stay in the family, as is attested by the rules concerning the marriage of an *epikleros*, an heiress. When a man died leaving behind a daughter, but no son, this daughter was to be married to her nearest male relative. Ideally, she would bear two sons; one of whom would inherit from his father, and one from his maternal

grandfather. This would also reconcile two conflicting desiderata: to give each son an inheritance and to keep the family holding undivided.

Other poleis had other strategies for preserving a rough equality among the citizens, ensuring each family a minimum livelihood. The Spartans called themselves *homoioi* ("equals"). Each male Spartiate was entitled to a portion of land which was worked by helots, and from this he contributed to the communal mess. Inability to make this contribution resulted in the loss of citizen rights. Again, Spartans were theoretically unable to alienate their ancestral plots. But by the 4th century BC the number of Spartans who were financially eligible to serve as hoplites had fallen disastrously. Wealth had accumulated in the hands of a relatively small portion of the population due to the transfer of property through dowry and inheritance by women: the wealthy were able to absorb more and more of the community's land through advantageous marriages.

The situation which allowed the Greeks to approach most nearly the ideal of equality among the citizens was the founding of a new colony. Beginning in the 8th century BC and continuing into the 5th century poleis would often solve their demographic problems by sending a portion of their citizens out to non-Greek territories to found a new city. Prospective settlers went on the understanding that the territory of the new polis would be allocated on an equitable basis. This did not mean that everyone would get exactly the same amount of land, but that, with no preexisting claims to the territory, and taking into account the variable quality of the lots, each would get a reasonable portion of the total land resources. When the division was done, the colonists would often swear an oath to abide by the distribution, and there might be actual legal penalties brought against anyone who in the future sought to have land redistributed.

In the 4th century the orator Isocrates described Greece as a land rent with civil strife and filled with destitute fugitives who posed a continuing threat to social order. His proposed solution, eventually made a reality by Alexander the Great, was a war of conquest against the barbarians, which would provide new lands on which to settle this horde. Whether or not conditions were quite so desperate in reality as in the speeches of Isocrates, it is certain that many Greeks left their homeland to settle in Egypt and the Near East as a result of Alexander's conquests. Those who went as soldiers were often rewarded for their services with grants of land. Since these grants were generally conditional upon continued military service, they frequently found it more profitable to lease the land to native cultivators. Furthermore, while the Greek poleis had avoided imposing direct taxes on land, seeing it as a sign of tyranny, those who received

their plots from the Hellenistic kings usually found that they came with a whole host of taxes in kind and in cash. Individuals or colonies might be granted immunity from these taxes, but even this immunity served to underscore the fact that all the land was ultimately the possession of the king and not of the citizen body.

In the Greek homeland this emigration did not lead to a more stable situation with regard to agricultural conditions. Instead, there was a continuing tendency for the few to accumulate larger properties, or a larger number of scattered properties, which would be leased to the increasing numbers of those without land or without enough land to live on. In recent years archaeological surface surveys have confirmed, independent of literary testimony, that the number of rural sites decreases from the beginning of the 2nd century BC, particularly at the time of the Roman conquest of Greece. These sites are generally associated with small independent proprietors. Sites that continue to appear in the archaeological record tend to be larger and show signs of affluence. On the basis of this evidence it has been suggested that the rural landscape came increasingly under the control of a few wealthy landlords. Their large estates would have been devoted to the production of cash crops and worked with large numbers of slaves. Alternatively, income could have been produced by leasing out plots of produce rents (Alcock, 1993, p. 72).

The late Roman landscape of Greece, however, shows a significant increase in the number of rural sites and there is a general sense of modest prosperity in the countryside. This is not really surprising, given that the peasants of the eastern Roman empire were not nearly as vulnerable to the pressures of large landowners as those in the western provinces, where the medieval institution of serfdom was already evolving. In the 4th and 5th centuries AD village communities of Asia Minor, Syria, and Egypt were still benefiting from the Hellenistic legacy of widespread urbanism. With towns and cities in which to market their products the peasants were able to pay their rents and taxes and maintain at least a measure of independence. This is not to say that conditions were not felt to be oppressive. Taxes were collected on both the land and its cultivators, peasants were always subject to extra assessments of produce and to demands for corvée labour. They had neither unrestricted freedom of movement nor an unlimited right to alienate their land. Reactions to these oppressive conditions often took the form of brigandage (Haldon, 1990, pp. 31–32), a phenomenon which also characterized the late Ottoman period.

Landscape

The great beauty and diversity of the Greek landscape were seldom fully appreciated by ancient Greeks, to whom these wonders were commonplace, or by modern tourists, who miss the glamorous parts. The best description of what the ancient Greek landscape looked like is the vision of the 12 mountains of Arcadia in the early Christian prophecy of Hermas, an Arcadian shepherd.

Greek landscapes are dominated by tectonics. Greece lies near the junction of two of the world's great tectonic plates, where Africa is burrowing under Europe. Over millions of years the forces of collision have generated the dramatic mountain landscapes of Greece, with their cliffs, gorges, and fault-scarps, especially around the gulf of Corinth and in Crete. Secondary effects include erosion and deposition, and the re-erosion of materials deposited during earlier periods of mountain building. Erosion has created the surrealistic gullied badlands of Macedonia and the northern Peloponnese, and the corresponding deposition has created many of the cultivable soils of Greece. Mountain building is, of course, still continuing today. At least three volcanoes – Santorini, Methana, and Nisyros – have erupted in historic times.

Most of the modern Greece is rocky, with cultivation limited to

plains or to places where soil has washed off the hillsides and accumulated in basins. Areas of land for cultivation were extended by the construction of terraces, bands of soil held up by retaining walls. Terraces created a level surface, got rid of boulders by building them into walls, accumulated and held soil, broke up the bedrock so that roots (especially of vines) could penetrate it, and increased absorption of water in times of heavy rain.

Wild vegetation in Greece ranges from forest to desert, depending mainly on rainfall and how much moisture is stored in the soil and bedrock (see the article on Climate). Forests occur mainly in mountains, especially in western Greece; often they occur on fissured limestone with no soil. In drier or more heavily used terrain forest gives way to *maquis*, land dominated by shrubs, most of which are in fact trees stunted into a shrubby form by browsing, burning, or woodcutting. Alternatively trees may form part of savanna, where large trees grow scattered in grassland or heath. Where moisture is more limited, the vegetation consists of *phrygano* ("scrub"), dominated by heath-like, spiny, or aromatic undershrubs which are not potential trees. Steppe is herbaceous vegetation with grasses, bulbous and tuberous plants. Patches of *maquis*, *phrygano*, and steppe typically occur intermingled, rather than in separate areas.

In Ancient, Byzantine, and Early Modern Greece wild vegetation was not underused land. It provided pasturage, fuel, materials for crafts, honey, edible plants, and medicinal herbs. The plants, except for those limited to cliffs, have the ability to resist, or recover from, browsing, burning, and woodcutting.

In pre-Neolithic times Greece was more wooded than it is now; in the drier east the trees probably formed savanna. There is some evidence for steppe, but *phrygano* was probably limited to particular, mainly coastal, areas. Crete and other islands may have differed from the mainland, owing to their peculiar faunas (nearly all extinct by the Bronze Age), including tiny elephants and mini-hippopotamuses. Lacking predators, these animals would have flourished sufficiently to bring about an ecological condition that would today be regarded as excessive browsing.

During the Neolithic and the Bronze Age the Greek landscape was affected both by increasing human activity and by the advent of a drier climate. Forests on good soils were uprooted to create farmland; on the remaining land native animals were replaced by domesticated – goats, sheep, and cattle. Forests retreated to places with moisture or good root penetration, being replaced by *maquis* or savanna. Undershrubs profited from the changes to establish areas of *phrygano*. The date, nature, and consequences of deforestation are controversial, but there is no firm evidence that Greece in Classical times was more

wooded than it is today.

By Classical times ecological changes were largely completed. The landscape looked not very different from Greece today, aside from urbanization, road making, and bulldozing. An important difference is the disappearance of fens, most of which were destroyed in the 19th century. Classical Greece had much more grain and legume cultivation than today, and much less olive-growing; they kept cattle and pigs, as well as sheep and goats. At least half the land was natural vegetation (forest, savanna, maquis, *phrygano*, steppe, and fen). There was already the infrastructure of a cultural landscape in the form of roads, field walls, pollarded trees, and some terraces. Terracing, begun in the Bronze Age, was probably more limited than in Early Modern times; no ancient author definitely mentions it.

The coast of Greece has also changed. After the last ice age the world's sea level rose some 100 m to about its present level. This created bays, which have since become river deltas or have been filled with material eroded from the hills. At the same time the land has been jerked up or down by tectonic movements. A famous example of coastal changes in historic times is at Thermopylae, where the site of the ancient sea-cliff battles is now well inland and deeply buried.

Ancient city states varied hugely in the territory and resources that they controlled. Athens and Sparta were giants, with access to all ecological zones, from mountains to the sea. But even Athens was not self-sufficient in timber and not always so in grain. Some of the smallest cities had recourse to only one or two ecological zones, like the three states on the barren mountain isle of Amorgos, or the city of Tarrha at the mouth of the gorge of Samaria in Crete, which apparently had no ecological resources at all except cypress timber.

In antiquity Greece was not, as today, a land of cities and large villages set in otherwise uninhabited countryside. Instead there were small towns, small villages, hamlets, and single farms, grading into field houses that were inhabited only seasonally. Such a dispersed pattern of settlement still survives in western Crete, the Mani, and the island of Cythera; elsewhere, especially in the Middle Ages and the 16th century, houses have clustered into villages.

The use of the land would also have fluctuated over the centuries, as the human population rose and fell and as opportunities for trade changed. At times of prosperity, cultivation and pasturage would have increased so that the land would have been fully used or overused. In leaner times trees and other vegetation would have been left to invade fields and pastures.

Good and bad land has not always been same as now. Some rugged, water-retaining, fertile mountain areas, such as northern Parnon, have a history of dense population. Some apparently promising plains, as at

Nemea, have had periods of use only as pasture. Undrained fens, now despised, were precious as summer pasture for cattle. Coastal plains, though offering good land, and small islands have not always been favoured for cultivation or settlement because of the danger of raids by pirates.

Language

The term "Greek" refers to the language spoken by the Indo-European inhabitants of Greece from their first arrival in that land to the present day. Greece was already populated when they arrived (probably not long after 2000 BC), but the original inhabitants spoke another language of which little trace remains; since there is no consensus even as to which language family it belonged, it is simply referred to as "pre-Greek". Greek itself belongs to the Indo-European family of languages and is thus related not only to Latin (and hence French, Spanish, and all the other Romance languages), but also to Sanskrit (and hence Hindi, Bengali, etc.), Hittite, Armenian, Albanian, Tocharian, Persian (and Kurdish, Afghan, etc.), the Celtic languages (Irish, Welsh, etc.), the Germanic languages (English, German, etc.), the Baltic languages (Lithuanian, etc.), and the Slavic languages (Russian, Bulgarian, etc.). Since all languages change over time, however, these relationships were much closer in ancient times than they are today.

The original Proto-Indo-European language from which Greek and all of these other languages evolved was highly inflected; it had eight

cases for nouns and divided number not into singular and plural but into singular, dual (used for two objects or people), and plural (used for three or more). It also had a number of sounds that have since disappeared from many of its descendants, such as vocalic (vowel-like) forms of L, R, M, and N, aspirated consonants such as DH, BH, and GH, and mysterious “laryngeal consonants”, the exact pronunciation of which remains uncertain. On the other hand the parent language lacked many sounds with which we are familiar, such as F, V, J, CH, Z, and TH.

Greek is one of the oldest attested Indo-European languages; its earliest known form is Mycenaean, the language of the Linear B tablets. Since these tablets date from the 13th century BC or earlier, the history of Greek can now be traced over a period of 33 centuries. Because Linear B was written in a syllabary that did not indicate all the sounds of a word, however, and because it was used for writing lists rather than literature, much remains unknown about Mycenaean Greek. Nevertheless, we can see that it had already evolved to be recognizably Greek rather than Proto-Indo-European. The dual and some consonants that Greek would later lose (Q, W, Y, H) were retained, but the old case system was somewhat simplified and a number of consonants and vowels had disappeared. Mycenaean Greek, as we have it, does not appear to be divided into dialects; tablets from Thebes, Pylos, and Crete show only minor variations in language. Nevertheless it is likely that speakers of other Greek dialects were present somewhere in Greece during the Mycenaean period: not all classical Greek dialects can be descended from Mycenaean, but all show evidence of contact with the pre-Greek population and thus of having existed in Greece for a similar length of time.

The Mycenaean period ended around 1200 BC and was followed by a time known as the Dark Ages, when writing was unknown throughout most of Greece. (A relative of the Linear B script seems, however, to have survived in Cyprus, where it later reemerged as the Cypriot syllabary). There is thus a gap during which one cannot trace the evolution of the Greek language; after the Mycenaean period, it next appears with our earliest evidence of the Greek alphabet, in the 8th century BC. By this time the number of cases had been reduced to five, the dual was in the process of disappearing, Q and Y had been entirely lost, and W was on its way out. Moreover, the Greek language was divided into a vast number of local dialects. Of these, only those spoken in Arcadia and in Cyprus appear to be direct descendants of the Mycenaean dialect; the other dialect groups, including Attic (the dialect of Athens), Ionic (the dialects of Greeks in Asia Minor), Aeolic (the dialects of the Lesbians, Thessalians, and Boeotians), and Doric (the dialects of Crete and most of the Peloponnese) seem to be

descended from something slightly different. All the dialects, however, are clearly part of the same language and were mutually comprehensible.

The language normally described by the term “Classical Greek” is Attic, the dialect of Athens in the 5th century BC. At the beginning of the 5th century BC this dialect had no special status, but Athens’ rise to political prominence during the Persian Wars and the extraordinary quantity of first-class literature produced by Athenians in the 5th and 4th centuries BC rapidly made Attic the most important Greek dialect. This is not to say that all ancient Greek literature was written in Attic; far from it. The earliest surviving literature, the Homeric poems, is written in a mixed dialect based on Ionic and containing almost no trace of Attic, and the poets who first followed Homer used a variety of dialects, none of them Attic. The Attic dialect first came into prominence with the development of tragedy, which was a distinctively Athenian genre. Even tragedies, however, were not simply written in the native dialects of their authors. The dialogue portions were composed in an artificial and elevated literary Attic with many features from other dialects, while the sections sung by the chorus were written in what was nominally Doric, though in some ways it would be more accurate to describe it as a Doricized Attic.

Comedy, however, made much more use of ordinary Attic, as did many prose genres. A peculiarity of Greek literature of the Archaic and Classical periods was that literary genre rather than the author’s origin normally determined the dialect used. Thus although two of the greatest early Greek poets, Hesiod and Pindar, both came from Boeotia and would naturally have spoken an Aeolic dialect, Hesiod wrote in the Ionic-based epic dialect and Pindar wrote in Doric, because these were the dialects appropriate to their chosen genres (respectively epic poetry and choral lyric). Tragic choruses had to be composed in Doric because of the tradition of Doric choral song out of which the tragic genre evolved. Scientific and historical prose was originally written in Ionic, but as time went on Athenian prose authors began to write in an Ionicized version of their own dialect. Many of these literary dialects, however, were rather different from the same dialects as used for non-literary purposes by native speakers and attested in local inscriptions; they contained features of other dialects and were usually meant to be separated from and elevated above the usages of ordinary speech.

In the 4th century BC the political power of Greece was gradually eclipsed by that of its northern neighbour Macedonia. The issue of whether the Macedonians could be considered Greeks was debated in ancient times much as it is today. Little remains of their original language (which is unconnected to the modern Slavic language known

as “Macedonian”), and from that little it is possible to argue either that Macedonian was a bizarre Greek dialect or that it was a different but related language. The Greeks themselves seem not to have understood it as easily as they understood each other’s Greek dialects. Culturally, however, it seems that the Greeks looked down on the Macedonians as uncivilized barbarians, and the Macedonian monarchs reacted to their own feelings of inferiority by a programme of linguistic and cultural Hellenization. Greek was adopted as the official language of the Macedonian court, where from the time of Philip II Greek literature and education were highly valued. Because of the political and literary importance of Athens, the form of Greek adopted by the Macedonians was an Ionicized Attic.

The Macedonians soon became far more powerful than the Greeks from a political point of view, but even after conquering Greece they retained their respect for its language and culture. The conquests of Alexander the Great in the late 4th century BC thus had the effect of spreading the use of the Greek language and the appreciation of Greek literature and culture over a huge section of the ancient world. In the Hellenistic kingdoms that resulted from Alexander’s conquests, Greek became the language not only of the court, but also of business, administration, and most upper-class interaction. Education normally consisted of training in the Greek language and literature, and knowledge of Greek was required for entry into the civil service and the army. Greek rapidly became the mother tongue of the elite as well as being widely spoken as a second language by much of the population. The less educated lower classes went on speaking their own languages most of the time, but these languages were less likely to be used in written communication.

The Greek used in the Hellenistic kingdoms was based on the Ionicized Attic adopted by the Macedonians, but it was sufficiently distinct from the dialect of Athens that it acquired a new name, the *koine* or “common dialect”. The Koine was in some senses a uniform dialect; the differences between Koine documents from different parts of the Hellenistic world are minimal compared to, say, the differences between Attic and Doric. In other respects, however, it was far from uniform; there was some local variation, and a good deal more variation based on the level of education of the writer and his intended audience. The most highly educated Hellenistic scholars, however, could and did produce not only Koine but also the various literary dialects of the earlier periods.

In Greece itself the loss of the individual city states’ political autonomy in the Hellenistic period led to the decline of the local dialects. Although most of the ancient dialects survived into the Roman period as spoken languages, the use of Koine came to be seen

as a mark of education, in Greece as in the rest of the Hellenistic world. The result was that Koine supplanted the local dialects as the language of the elite and gradually became the official written language of cities that had once proudly displayed their own dialects in inscriptions.

Eventually Greece and the various states that had been part of Alexander's empire fell under Roman rule. This meant the introduction of Latin into Greece, but since the Romans had no cultural heritage to compare with that of Greece, the status of their language suffered greatly. The use of Latin never became widespread in Greece, but Greek grew more and more popular in educated circles in Rome. Meanwhile, in the other states that had been part of Alexander's empire, a tripartite linguistic situation arose: Latin became the language of some administrative and military circles, but Greek remained the language of education and culture, while much of the native population went on speaking the language that they had spoken before Alexander's arrival. The most important and prestigious of these three languages was normally Greek; in Egypt, for example, where large quantities of public and private documents have been preserved on papyrus fragments buried in sand, it is clear that most writing was done in Greek. In fact, the eastern half of the Mediterranean in the Roman period was often called the "Greek east". The degree to which Greek actually replaced local languages, however, depended on the region; in Egypt, despite the vast numbers of Greek papyri, most of the peasants spoke Coptic, but in Asia Minor the native languages tended to die out completely during the Roman period.

The dialect of Greek involved, of course was still the Koine, but after centuries of evolution and of being used as a second language it showed some significant differences from the Ionicized Attic with which it had begun. These differences are perhaps greatest in phonology, for the pronunciation of Greek changed dramatically during the Hellenistic and Roman periods. At the time when the Greeks began to use the alphabet (the 8th century BC), their language contained ten simple vowels (A, E, I, O, U, each of which had separate long and short forms) and a wide variety of diphthongs (AI, EI, OI, UI, AU, EU, and OU, many of which could have either a long or a short vowel as their first element). By the Classical period, however, the short diphthongs EI and OU had already been monophthongized, and shortly afterward those diphthongs that consisted of a long vowel followed by I lost the I. (As a result, this I was not normally written in ancient documents, but it now appears in Classical texts as the iota subscript.) Then the short diphthong AI merged with short E, UI and short OI both merged with U, and the already monophthongized short

EI merged with I. Eventually the distinction between long and short vowels was lost altogether.

The consonants phi, theta, and chi, which had originally been aspirated stops (P followed by H for phi, T followed by H for theta, K followed by H for chi), turned into the fricatives F, TH (as in English “thing”), and CH (as in German “ich”, not English “change”), while in most contexts the voiced stops B, D, and G became the voiced fricatives V, TH (as in English “the”), and the voiced equivalent of CH (which does not exist in English). In the Classical period Greek did not have a stress accent as in English, where one syllable of each word is perceived as pronounced more emphatically than the others, but rather a pitch accent as in modern Norwegian, where an accented vowel is perceived as pronounced on a higher pitch (one Greek grammarian speaks of the voice being raised by a musical fifth). In Koine, however, the Greek pitch accent changed to the stress accent that is still used in Modern Greek.

It is sometimes difficult to pinpoint the date of these changes in pronunciation, not only because they occurred gradually and probably took effect in some regions before others, but also because the Classical spelling remained in use for most written documentation. Spelling mistakes, however, are very useful in tracing linguistic evolution: when papyri regularly show AI for E and E for AI, this is evidence that the two were pronounced the same, and the date when this mistake becomes common (the 2nd century BC) can be taken as one by which the change was complete, at least in Egypt. Borrowings into and from other languages also give us clues: when the Romans first began to borrow Greek words containing the letter phi, they represented it with PH, showing that the sound in question was an aspirated P. But later on the sound of phi changed to F, and at that point (the 1st century AD) the Romans used F to represent it.

The complex grammar and syntax of Classic Attic were also simplified in Koine. Two past tenses, the perfect (“I have done”) and aorist (“I did”) became interchangeable so that either could be used in either sense; eventually the perfect died out and only the aorist was used. The optative, a verbal mood used to express wishes and potentiality and which replaced the subjunctive after verbs in a past tense, disappeared from Koine almost entirely. The middle voice, which in Classical Greek was distinct from both the active and the passive in meaning, if not always in form, was also lost. At the same time many irregularities of declension and conjugation were eliminated; thus, for example, the verbs that had originally ended in –MI began to lose their distinctive conjugation, although this change was completed only in the Byzantine period. During the Roman period many words of Latin origin also found their way into Greek.

The changes in grammar, syntax, and vocabulary were more often reflected in writing than those in pronunciation, but they too could be avoided by more educated authors. The New Testament, for example, is a document of the early Roman period written in a fairly basic form of Koine; it displays a grammar and syntax that are much simpler than those of Classical Attic. But it is not a uniform text written by a single author, and in some portions, for example the Gospel of Luke, even the optative appears. Other writers of the early Roman period, such as Polybius and Plutarch, wrote in a very different type of Koine far closer to Classical Attic. Since Greek education stressed the reading and memorization of Classical texts, there was a certain status attached to an ability to write Greek in a manner closer to that of those texts. Writers with a good education normally came from a fairly high-status background and naturally wanted their works to show this education and background, although if they were writing for a popular audience they might simplify their language in the interests of comprehensibility. People with little education did not normally become writers – the New Testament is something of an exception in this regard – but they often composed private letters which have survived on papyrus and tell us much about the evolution of non-literary Koine.

One of the most significant linguistic events of the Roman period was the revival of literary Attic in the 2nd century AD. Whereas earlier well-educated writers had been able to win respect using a form of Koine relatively close to Attic, it was now necessary for them to use “pure” Attic, a language as close as possible to that of Plato and the Classical orators. In the 2nd century AD Attic came to be seen as “Greek”; everything else was simply evidence of lack of education. The great writers of the period, such as Lucian, managed to achieve Atticism to a remarkable degree. Purity of language was required not only in writing but also in speech, and the opprobrium heaped on men of letters who accidentally delivered themselves of a non-Attic word or phrase is well documented. This does not of course mean that everyone in the Greek speaking world began to speak Attic in the 2nd century; far from it. But everyone with literary pretensions tried. The reason for this revival seems to have been a desire for closer association with the glorious Greek past, since continuity of culture, the one thing that the Greeks had in a world dominated by the Romans, appeared to be assured by linguistic closeness to the past.

After the 2nd century AD the extremes of the Atticizing movement were modified, but the achievements of the period had a lasting effect on literary Greek; Attic always remained as an ideal, even if fewer writers pursued it. Written Greek came to consist of a range of styles combining Attic and Koine; at the top end of the spectrum were

compositions in almost pure Attic, but these were the exception rather than the rule, and most writing showed some or many Koine features. Virtually all writing, however, was conducted in a language distinct from that used in normal speech. Learning to write involved learning the use of written Greek, rather than learning how to transcribe one's own speech. This situation is not so different from that which exists today for English, where learning to write involves learning the difference between “too” and “to”, and at a higher level between “its” and “it’s”.

Starting in the 3rd century ^{AD} military imperatives forced a gradual administrative division of the Roman empire into eastern and western halves, with a resulting decline in linguistic interaction. In the 4th century the capital of the empire was moved from Rome to Byzantium (refounded as Constantinople), a move that bolstered the status of Greek as an imperial language and led in time to its official recognition as such. The use of Greek in the West and that of Latin in the East was sharply reduced, particularly after the early 5th century collapse of the western Roman empire. The eventual result was a government in Constantinople that used Greek and ruled a largely Greek-speaking (whether as first or second language) populace, but which still regarded itself as being the Roman empire. From this situation arose the use of term Romaic (“Roman”) as a name for the Greek language; this term remained in use as late as the 19th century as a means of referring to spoken, as distinct from written, Greek. Even today, some Greeks use *Romios* to mean “a Greek person”.

City in Thessaly

Larissa is located in the middle of the Thessalian plain on the right bank of the river Peneus. It is about 32 km from the sea, and bestrides the major north–south routes between Athens and Macedonia. Among the few remains of the early city are a late Hellenistic theatre excavated near the modern main square, a low hill to the south of the square marking the site of the ancient acropolis, and the remains of the Byzantine *phrou rion* (fortress) to the east of the square.

The name Larissa is pre-Greek, and means “citadel”. (Indeed, settlement on the site goes back to palaeolithic times, as is attested by archaeological remains.) According to Greek mythology, however, the city was founded by Acrisius, the father of Danae and the grandfather of Perseus, and was named after a nymph (whose likeness appears on coins of the 4th century BC). Unlike other places in the area, such as Phthia, Larissa is not named in the catalogue of ships in book 2 of the *Iliad*, or indeed in the rest of the *Iliad* or *Odyssey*, though some scholars have wanted to associate Larissa with the city Argysa, which is mentioned in the catalogue of ships.

When Larissa first became important in Greek history, it was dominated by the powerful family of the Aleuadae. Their influence in Larissa, and, to a lesser extent, in Thessaly as whole, lasted from the early 6th to the end of the 4th century BC. The founder of the family was Aleuas, who claimed descent from Heracles. Although tradition more strongly associates Heracles with the rival (and related) Scopadae of nearby Crannon, the late 6th- and early 5th-century BC poet Simonides is cited by Theocritus (in *Idyll*, 16. 34–46) as praising Aleuas among other Thessalian grandees, such as the Scopadae and the Creondae, for his wealth: “Many slaves drew their monthly rations / in the palaces of Antiochos / and King Aleuas” (tr. Barriss Mills).

The Aleuadae were renowned as patrons of literature; writers of different generations and genres such as the poet Pindar, the Presocratic philosopher and rhetorician Gorgias, and the physician Hippocrates are all said to have spent time in Larissa as their guests. The fact that both Gorgias and Hippocrates are said to have died there may be a less than ringing endorsement of Aleuad hospitality.

Politically speaking, the legacy of the Aleuadae was more mixed. They were strongly associated with the political and military organization of Thessaly along federal lines. Thorax, the leader of the Aleuadae at the time, and his brothers sided with the Persians, during Xerxes’ invasion of Greece in 480 BC, as did the neighbouring Macedonians. This realpolitik led to a loss of influence by the Aleuadae after the Greeks defeated Xerxes and drove his army out of Greece. Furthermore, by the end of the 5th century BC, a democratic revolt in Larissa and the rise of tyrants at Pherae had weakened the

power of the Aleuadae. In the 4th century BC they made the fatal mistake of calling upon their fellow Heraclid, Philip II of Macedon, as an ally against the tyrant of Pherae. Philip annexed all of Thessaly and held it, despite an unsuccessful revolt of the Aleuadae in a belated attempt to undo their mistake. The Aleuadae faded from history thereafter.

Laurium

District in Attica

The district of Laurium played a pivotal role in the history of ancient Athens. It covered an area of about 200 square km, extending from Anaphlystus south to Sunium and then north to Thoricus. Hilly with only a few plains and subject to scarce rainfall, Laurium's importance in antiquity lay in its argentiferous lead, mined by slaves for centuries. Mining may have occurred as early as the Middle Bronze Age (at least at the site of Thoricus), when open-cast mining was used to extract silver and lead. As excavations have shown, mining in Laurium continued down through the Archaic period. Shafts or adits were sunk to reach the highly argentiferous ore deep under the surface; while some shafts reached a depth of over 130 m and were fitted with wooden ladders, huge galleries, and ventilation shafts. The extracted ore was sent to workshops (*ergasteria*), which included grinders, washeries, cisterns, furnaces, and cupellation work-areas. Athens considered the mines state property, but leased them at annual fixed rates (typically 4 per cent) to private individuals or companies (*poletai*), which employed slaves and condemned criminals. (Many of these lease arrangements have been published; see the bibliography below.) The mines proved especially important in the 5th century BC. In 483 a particularly rich vein was struck at Maronea, immediately yielding 100 talents of silver. With the Persians advancing on Greece, the Athenians, on the advice of Themistocles, elected to use the silver

to finance an additional 100 triremes; the augmented Athenian fleet defeated the Persian navy at the decisive battle of Salamis in 480, preventing a barbarian conquest of Greece. The mines continued to produce large amounts of silver during the century as Athens built its maritime empire. In the later stages of the Peloponnesian War, production ceased when the Spartan army, on the advice of the renegade Athenian general Alcibiades, occupied the nearby mountain pass of Deceleia, thereby blocking the land route from Euboea to Athens. In 413 over 20,000 slaves at Laurium reportedly defected to the Spartans. The mines were reopened after Athens had established in 377 the Second Athenian Confederacy; extensive mining was conducted for the rest of the 4th century. However, mining ceased in the 3rd century (the last dated lease is from 306 BC) due to a precipitous decline in the price of silver caused by the flooding of Macedonian gold coinage. Limited and sporadic mining occurred down to the end of the 2nd century, but slave uprisings in the 130s and 100s helped bring about the closing of deep mining. During the Roman empire slag heaps on the surface were resmelted, but otherwise the area was abandoned. It is estimated that altogether 2,000,000 tons of ore were smelted, with a yield of 1200 tons of silver and 400,000 tons of lead. The mining and processing of cadmium, magnesium, and lead continues in the area to the present day.

The administrative and economic centre of ancient Laurium was the city of Thoricus, located in the very northeast corner of the district. The ancient site is spread over on the side and top of the mountain Velatouri; its harbour, a refuge fortress built during the Peloponnesian War on the St Nikolaos peninsula, also served as a naval base. The lower slopes of the mountain were ringed by a fortification wall. Inside the wall are remains of numerous houses, workshops, ore washeries, an extensive industrial quarter, three sanctuaries, and a theatre. The theatre, with a unique design and shape, was first built in the 6th century BC and later expanded in the mid-4th to a seating capacity of 5000–6000; a temple of Dionysus formed part of the west entrance. Nearby necropolises have yielded nearly 200 tombs from the Protogeometric to the Hellenistic periods; some of the Geometric houses found among the graves show signs of silver working. Higher up, on the Velatouri, are prehistoric remains. Three Mycenaean tholoi or beehive tombs and a Mycenaean chamber tomb have been excavated; signs of cult worship in the Archaic period are evident. Trial trenches have demonstrated that the acropolis was inhabited as early as the beginning of the Early Bronze Age (c.2900 BC) down through the Geometric period, when houses were built over the remains of prehistoric dwellings. The site was abandoned during the early Roman empire. Neighbouring silver-mining sites in the Agrileza

district, Pountazeze Bay, Mekala Perka, and Gaidhouromandra Bay have recently been uncovered.

Law

Evidence for the legal history of Greece is patchy. For some periods there are only the legislative texts, for others only contracts or court decisions. In these cases, the extent of the gap between the law and its application remains unknown. This article will attempt to provide a brief overview of the available sources of law in different historical periods.

The sources of law in ancient Greece include inscriptions preserving laws and decrees of the assemblies of the city states, private transactions (sales, manumissions, wills, leases, loans), interstate agreements, lawcourt speeches pertaining to political and legal disputes in 4th century BC Athens, philosophical and sociological treatises, and, to a lesser degree, literature (comedy and drama). A particular case in the ancient Greek world is Egypt under the Ptolemies. The legal system, developed over almost ten centuries, is preserved in numerous papyri written in Greek, including all kinds of

documents from receipts for deliveries and censuses to marriage and divorce agreements, inheritance settlements, loans, etc.

The several hundred tablets of Linear B, the earliest deciphered form of writing in Greece, from 13th century BC Pylos, Knossos, and Thebes reveal very little, if anything at all, about the legal aspect of Mycenaean society. They relate mainly to the administrative structure of these kingdoms and the status of the land.

The earliest information on law concerns procedural affairs or what is sometimes called dispute settlement. In the 8th century society of the Homeric poems and especially in the famous scene on Achilles' shield (*Iliad*, 18. 497–508), the disputants over the payment for homicide present their case to the assembled elders. Hesiod, the next earliest source, refers to gift-devouring kings when it comes to adjudicating disputes. In the late 7th century BC there was a wave of legislators, especially in the colonies of southern Italy (Zaleucus Epizephyrii at Locri, Charondas at Catana) and only subsequently in Athens (Draco), Sparta (Lycurgus), and Mytilene (Pittacus). The content of their legislation is preserved in a piecemeal way by later authors, who underline the moral and pedagogical aspect of their legislation (laws about revenge, about amending laws, banning the sale of land, regulating family life, etc). The first firmly attested laws come from late-7th-century Crete. They mainly concern procedural matters, such as the ban on magistrates serving a second term in office in the small town on Driros (*M-L*, 2). However, the most famous example of legislation from Crete is the early-5th-century inscription known as the "law-code of Gortyn" (*IC*, 4. 72). The Gortyn laws regulated property affairs between spouses in case of divorce or death, inheritance, adoption, sexual offences, personal status, and procedural matters associated with them. Recent research suggests that these laws did not form part of a codification programme but were the outcome of successive stages of codification and amendment.

The best-known legal system of the ancient Greek world is that of Athens. The first major legislative effort was made by Solon in 594 BC. It comprised constitutional reforms (establishment of a council), the abolition of debts, and innovations in the inheritance laws. Further reforms in the constitutional framework were introduced by Cleisthenes in 509 BC (new administrative units and a reformed council) and in 462 BC by Ephialtes (reduction of the political powers of Areopagus). The text of the Draconian law on homicide survives from the late 5th century. The main characteristics of law in Athens in the 5th and 4th centuries BC were: (1) law thought of as a piece of evidence, (2) the lack of autonomy of the legal sphere, (3) the interaction of politics and law in the domain of public law, (4) the multiplicity of procedures available to the prosecutor, (5) popular

courts appointed by lot, (6) lack of definitions of offences, and (7) absence of a professional class of jurists and lawyers.

For the remaining city states and kingdoms, with the exception of literary (and for some questionable) tradition on the Lyscurgan legislation in Sparta, there are only fragmentary and isolated pieces of evidence about their legal systems. These are mainly decrees of the assembly honouring individuals, registers of acts of manumission, of leases, sales of land or other transactions, which do not provide a coherent picture of legal life.

The rise of the kingdom of Macedonia followed by the foundation of numerous Greek colonies in the Middle East, Egypt and Anatolia resulted in the interaction of the laws of the city states among themselves and with the laws of the colonized lands. Egypt is the best documented example of this interaction between the laws of the Greek settlers, soldiers, and officials and the local population. In Greece proper the Macedonian domination did not affect the legal life of the cities to the point of obliterating their autonomy. Certainly, the kings of Macedonia and their successors granted conquered land and privileges to their friends and friendly cities. But they did not interfere directly with the legal institutions. In the same way, the Roman conquest of Macedonia in 168 BC and of the remaining Greek cities in 146 BC did not mean the abolition of their legal autonomy. Most cities kept their legal institutions and rules except in the area of public law, which had to accommodate Roman wishes. The Romans applied Roman law only to Roman citizens while the affairs of the conquered people and the allies were regulated by the *jus gentium*. That period ended with the grant of Roman citizenship by Caracalla in AD 212 to every free inhabitant of the empire. From that moment, Roman law superseded the laws of the remaining city states. The extent to which local laws and customs disappeared or influenced the application of the rules of Roman law is still debated.

Lebadea

City in Boeotia

In antiquity Lebadea was best known as the site of the oracle of Trophonius. Today, it is the largest city in Boeotia.

The town spreads out on both sides of the river Hercyna, which issues from an impressive gorge, dominated at one end by a Frankish castle and at the other by a graceful Turkish bridge. Lebadea lies south of Chaeronea, southwest of Orchomenus, and west of Coronea, from which it is separated by Mount Laphystion. Like Mount Laphystion, the later polis of Lebadea originally belonged to Orchomenus. Legendary connections linking Lebadea and Laphystion to Orchomenus (Trophonius and Agamedes were sons of Erginus of Orchomenus, and Athamas king of Orchomenus attempted to sacrifice his children to Zeus Laphystius) support the impression that Lebadea was originally a dependency of Orchomenus (Lebadea's absence from the Homeric Catalogue of Ships – strongly felt by later inhabitants, who identified their polis with Homeric Mideia – is another

indication).

The earliest contemporary references to Lebadea by name occur in the 5th century BC. Lebadea and the oracle of Trophonius seem to have come to the notice of the outside world, that is to say, Athens, at the time of the battle of Coronea in 446 BC, after which the oracle began to become famous. Lebadea was independent by the end of the 5th century BC. Under the federal constitution described by the Oxyrhynchus Historian, Lebadea at this period took turns with Haliartus and Coronea in contributing one of the II Boeotarchs (Hell. Oxy. 16 [II]. 2–4). Although attacked and plundered by Lysander in 395, the polis recovered sufficiently to issue its own independent coinage after the King's Peace (the absence of any coins attributable to Lebadea in the late 6th century is another indication that it had not yet become independent at that time).

Lebadea was one of few towns in Boeotia to survive and prosper throughout antiquity. By AD 100 it was one of the most important towns on the mainland, and an almost obligatory stop on any visitor's "grand tour", no doubt because of the oracle of Trophonius, its best-known sanctuary. This was just outside the town, on the banks of the river Hercyna. The oracle functioned as early as the 6th century BC and perhaps even earlier. It shares the characteristics of two distinct types of oracle. The first, exemplified elsewhere in Boeotia at the Amphiareion near Oropus (and also possibly at the Thesprotian Nekromanteion), is one where the god lives underground and is approached directly at night by the consultant. Trophonius' oracle was also one of a number clustered around Lake Copais, each situated more or less at the limits of its polis. Here the predominant features were a hill or mountain represented by a young god, and a spring issuing from it, represented by a nymph who was usually the god's *trophos* (nurse). Divination came through inspiration caused by drinking the water of the spring, which was the real medium.

The traveller Pausanias (second half of the 2nd century AD) gives a vivid description of his own consultation of Trophonius. First, he spent several days in a house sacred to the Good Daemon and Good Fortune, bathing only in the water of the Hercyna, and sacrificing to the divinities of the sanctuary. The entrails of each victim were scrutinized to see if the omens were favourable. On the night of the actual descent he put on special clothes. The procedure began with the sacrifice of a ram over a pit and invocation of Agamedes: only if the omens from this sacrifice were favourable could the consultation proceed. He was taken to the Hercyna, anointed and washed, and then to two adjacent fountains of Forgetfulness and Memory, from which he drank. Then, after worshipping the early cult image of Trophonius, he proceeded to the oracle, where he was let down into the chasm by

means of a ladder. At the bottom he lay on his back, holding honey-cakes in his hands, and thrust his feet and legs into a narrow gap between the wall and floor of the pit, whereupon he was pulled through the hole. Inside he was confronted by the god (Pausanias says that prophecy could come by sight or sound, but does not say what his own experience was), and then thrust out again feet first through the same hole. Back on ground level, he was seated by the priests on the throne of Memory, and asked to describe his experience.

The other important cult at Lebadea was that of Zeus Basileus (the King), probably the same as the god worshipped on neighbouring Mount Laphystion. He is best known in connection with the games called *Basileia*, which the Boeotians, under the leadership of the Thebans, founded to commemorate their victory over Sparta at the battle of Leuctra (371 BC). The Thebans chose the site carefully, to emphasize their own domination of Boeotia and the consequent humiliation of Orchomenus.

The intertwined development of the two cults – of Trophonius and Zeus Basileus – reveals how religion, politics, and commerce interacted in the life of a polis. In the latter part of the 3rd century BC the polis of Lebadea undertook a major building project, which would affect its two outstanding attractions, the sanctuaries of Trophonius and Zeus Basileus. The plan was to build a temple of Zeus – huge by the standards of mainland Greece – on the top of a hill which dominated the route leading past Lebadea to Delphi, as it still does. They also planned to move the site of the oracular chasm from inside the sanctuary of Trophonius to the mountain top. The plan to build the temple failed due to shortage of funds. The project was eventually taken over by the Boeotian Confederacy, but too late, for very soon afterwards the confederacy was dissolved by the Romans and all that was left of the undertaking were the foundations of the building – on the hill called Profitis Ilias – and a pan-Boeotian college of *naopoioi* (temple fabric officers) who, since their work was never finished, were never disbanded.

The other part of the project was completed. It is quite clear from Pausanias that the oracle was not in the sanctuary of Trophonius itself, but beyond and above it, on the hill which also bore the temple of Zeus Basileus. In fact, the remains of this man-made hole were discovered between the foundations of the temple of Zeus Basileus and the chapel of Profitis Ilias (although it has since vanished with the complete rebuilding of the chapel).

Aside from these two important sanctuaries, relatively little is known about public religious activity at Lebadea. There has been no systematic excavation in the ancient town site: accidental finds late in the 1930s revealed evidence for the worship of the mother of the

gods, of Artemis Eileithyia, and Zeus Meilichius. Their find spot, although it was clearly not at their original sites, suggests that the sanctuaries of these deities were at or near the outskirts of the urban area of the polis. Pausanias says only that Lebadea had all the amenities of a normal Greek polis, but he does not describe them. To him they were banal, and not as interesting as the oracle of Trophonius.

Lemnos

Island in the northern Aegean

The position of Lemnos in the northern Aegean, where it lies midway between the tip of the Mount Athos promontory and the coast of Asia Minor, meant that control over it was always sought after. Any ships entering or leaving the Hellespont (the Passage of Romania, now the Dardanelles) could do so only with the knowledge (and often the permission) of the current rulers of Lemnos. The frequency with which their identity might change is a symptom of its strategic importance to the Hellenic world throughout its history. The island is now administered under the nomos of Lesbos.

Lemnos has an area of 476 sq km and, like a number of the Aegean islands, its shape indicates its volcanic origins, two bays to north and south almost dividing the island in two; the smaller, eastern, sector was where the capital of the island in antiquity, Hephaestus, was situated, while on the coast of the western sector, larger and much more mountainous with the highest peak of Mount Skopia reaching 430 m, the medieval and modern capital of Myrina is located. The low-lying and flatter areas of the island are quite fertile, and produce a variety of crops. A tradition, already current in antiquity and still existing in the 20th century, credited Lemnian earth, excavated on one day each year, with the power of healing many kinds of wounds; it was exported all over the Hellenic world.

In antiquity Lemnos figured both in Homeric legend and in Hellenic history. Herodotus (4. 145) related how the Argonauts, who according to legend had arrived on the island and left progeny there, were driven out of Lemnos three generations later by the Pelasgi. Later (5. 26) he described how Lemnos, with Imbros, was taken from the Pelasgi by Otanes, who had already occupied Byzantium and Chalcedon. The stronghold of Myrina figured early in the history of the island, as when Miltiades, having called on the Pelasgi to leave the island – a call which the townspeople of Hephaestus obeyed – was defied by the inhabitants of Myrina, whom he besieged (no doubt secure in their rock-perched fortress) before eventually ejecting them by force.

Leonidas c.530–480_{BC}

King of Sparta

Leonidas was famous for his heroic attempt to hold the pass of Thermopylae in central Greece against the advance of the Persians under king Xerxes in 480_{BC}. His father, Anaxandrides of the Agiad royal house (Sparta had a dual kingship with two royal houses, the Agiads and the Eurypontids), had married his niece but had no children, whereupon the ephors and the council of elders (Gerousia) forced him to take a second wife, who produced a son and successor, Cleomenes I. But shortly after Cleomenes' birth, the first wife, who was hitherto childless, produced three sons: Dorieus, who died in a failed attempt to plant a colony in Sicily, Leonidas, and Cleombrotus. After Cleomenes lost his throne around 490_{BC}, probably shortly before the battle of Marathon in that year, Leonidas succeeded, having married Cleomenes' only child, Gorgo.

In 480_{BC} the Persians, whose expeditionary force had been defeated at Marathon ten years earlier, launched a massive invasion: their army, led by Xerxes himself, crossed the Hellespont by pontoon bridges and advanced through northern Greece while the navy, carrying supplies, cruised along the coast. The Greek states that were willing to resist allied themselves under Spartan leadership, and first attempted to make a stand at the vale of Tempe in Thessaly, but the

commanders of the joint land and naval force that was dispatched there withdrew once they realized the position was indefensible. A second attempt was made at the pass of Thermopylae, where the road between the Malian Gulf and Mount Kallidromos was much narrower than today. Leonidas was sent there with an allied force totalling perhaps 7,000 foot-soldiers, including 300 elite “Spartiates” of the royal bodyguard, and a comparatively large naval contingent was sent to Artemisium at the northern tip of the island of Euboea to prevent any joint operation between the Persian fleet and the army on land.

However, Leonidas’ force was unaware that there was another path bypassing Thermopylae along the ridge of Kallidromos, known locally as the Anopaea. When they learned about it on their arrival, many, particularly those from the region south of the isthmus of Corinth, where the allies from the Peloponnese were building a defensive wall, wanted to withdraw. But Leonidas quelled the panic and assigned the 1,000-strong contingent from Phocis, who knew the terrain, to guard the Anopaea.

For two days the Greeks ward off all Persian efforts to force the pass. But then a traitor, whom the Greeks identified as Ephialtes from neighbouring Malis, offered to lead the Persians along the Anopaea, and Xerxes assigned his elite corps of 10,000 “Immortals” to the manoeuvre. At dawn on the third day Leonidas learned from his scouts that the Persians were circling at his rear by the Anopaea. He sent home the allied contingents from the states to the south of the isthmus of Corinth, while he himself, with his 300 Spartiates, and 700 Thespians and 400 Thebans from north of the isthmus, secured their retreat by remaining behind in the pass and fighting to the death. The Greek fleet at Artemisium, which had engaged the Persian navy timidly while the battle at Thermopylae was taking place, retreated to Salamis off the coast of Attica as soon as it learned of the disaster.

Leonidas’ decision to stay and fight was a rational choice made to save the bulk of his army, but he and his brave “Three Hundred” entered mythology almost immediately. Herodotus, who published his *Histories* around 425 BC, reports that Sparta had received an oracle from Delphi that said that either Sparta itself would be destroyed or a Spartan king would perish, and Leonidas, knowing the oracle, chose to save his state by his death. Thermopylae became the chief building block of the Spartan mystique of utter devotion to duty, which was epitomized by the couplet that Sparta engraved on the monument erected where Leonidas’ Spartiates made their last stand: “Go, stranger, to the Spartans tell / That here, obeying their commands, we fell.” More than half a century later, in 425 BC, when a force that included some 120 elite Spartiates surrendered to the Athenians at the bay of Navarino during the Peloponnesian War, Greece was amazed

that they did not die fighting. Leonidas himself became the paradigm of the soldier who obeys orders without question.

JAMES ALLAN EVANS

See also [Persian Wars](#)

Biography

Born c.530 BC, Leonidas became king of Sparta after the death of his half-brother Cleomenes in 490. In 480 he attempted to hold the pass of Thermopylae against the Persian army with a hand-picked force of 300 Spartiates and 1100 Boeotians. Their fight to the death immediately entered mythology. His memory has regularly been invoked ever since as the model of resistance to tyranny.

Lesbos

Aegean island

Physical remains and the Homeric poems associate Bronze Age Lesbos with Anatolia and the Troad; despite a tradition of Greek migration two generations after the Trojan War, Greek artifacts are rare before the 10th century BC. After 900 BC Anatolian connections continued in personal names (Myrsilos), cult (Cybele), and material culture, but Lesbos’ cities (Antissa, Arisba, Eressos, Methymna, Mytilene, Pyrrha) were inhabited by speakers of a Greek dialect (Aeolic) and no allophone (“Pelasgian”) population remained. In the 8th century Aeolian Greeks established settlements on the coasts opposite Lesbos and in the Troad; by 700, except for Assos, they were controlled by Mytilene, and Methymna had enslaved Arisba. Inter-city hostility became a constant of Lesbian history.

Mytilene’s dependencies in Asia Minor, outposts in Pontus, Thrace (Aenus), and Egypt (Naucratis), good relations with the Lydian monarchy, and flourishing trade in oil and wine, made Lesbos a major cultural force from 700 to 500 BC. Among their accomplishments were close-fitting polygonal masonry (*Lesbia oikodome*), “Aeolic” capitals with vertical volutes (linking Phoenician models with later Greek orders), and lyric poetry, associated with the cult of Orpheus at Antissa, the home of Terpander (676 BC); Mytilenean hegemony may explain why Terpander and Arion of Methymna worked in mainland

Greece. Around 600, Sappho and Alcaeus wrote for and about Mytilene in Lesbian dialect, which was used in inscriptions as late as the 3rd century AD; Lesbian accentuation is maintained in modern place-names (Yéra for Hierá). Besides their poetic influence, Sappho and Alcaeus illustrate much about archaic Lesbian society. Sappho shows how much less restricted women's roles were on Lesbos than in democratic Athens, more like Lydia, where women chose their own husbands; the pejorative use of terms derived from "Lesbos" for sexual behaviours reflects male hostility to such freedom as much as to Sappho's sexuality. Mytilenean politics, as presented by Alcaeus, provided a paradigm of the relationship between aristocracy and tyranny. Mytileneans, with ties to Sardis, may have been the first Greeks to use the Lydian term *tyrannos* for their rulers; it was applied also to the constitutional rule of Pittacus around 590 BC.

After Persian domination the Lesbian cities joined the Delian League in 479, to which Mytilene and Methymna provided ships rather than tribute. In 428 Methymna and Tenedos denounced to Athens Mytilenean plans to unify Lesbos by force; the punishment of Mytilene's subsequent revolt became an eloquent symbol of Athenian imperialism.

In the 4th century Aristotle conducted primary research on Lesbos. In the Hellenistic period Methymna and Eressos were Ptolemaic but Mytilene remained independent. Methymna was an early ally of Rome, but Antissa was destroyed by Rome in 169 BC for supporting Macedonia, and Mytilene, the most persistent supporter of Mithradates of Pontus, was conquered by Rome in 80.

In 62 BC Pompey gave Mytilene back its independence as a favour to his friend, the historian Theophanes. Mytilene developed a special relationship with Rome; several Mytileneans, including the descendants of Theophanes, the sophist Potamon, and the poet Crinagoras, had significant careers in the capital, while important Romans, notably Agrippa and his family, resided in, and were honoured by, Mytilene.

The pastoral novel *Daphnis and Chloe* is part of this relationship. Set on Lesbos by an author with a Roman name, its account of the island's cults had special resonance for descendants of Theophanes, who led a Dionysiac cult near Rome. Longus' assimilation of the pastoral form to that of the love romance and his choice of fertile Lesbos as its setting affected all subsequent pastorals.

Libanius AD **314–c.393**

Teacher of rhetoric

Libanius was born at Antioch, where he belonged to one of the leading curial families. He was the most highly esteemed teacher of rhetoric of his time, and attracted pupils from all over the Near East. Yet he spent most of his life teaching in his native city and died there. Libanius wrote in an elaborate Atticizing Greek that was admired and imitated for most of the Byzantine period. In consequence a large part of his literary output survives: almost 1600 letters, 64 orations on topical questions, 51 declamations, and numerous rhetorical exercises. We therefore know Libanius better than all but a very few individuals of antiquity, and his writings are an almost inexhaustible source of information about social life, politics, administration, entertainments, and education in the 4th century AD; thanks to Libanius, Antioch is by far the best-known provincial city of late antiquity.

Libanius was above all a traditionalist. He was an Atticist in the tradition of the Second Sophistic. His vocabulary, syntax, and sentence structure are based on those of Classical Athenian authors. He was an admirer of Aelius Aristides (AD 117–c.189), but he was thoroughly familiar with the Classical authors themselves, above all Homer, Demosthenes, and Thucydides. References and allusions to Plato also occur frequently in his writings. He pays respect to the wisdom of Plato the philosopher, but what he adopted for his own use was Plato’s mastery of language. Above all he used him as a source of rhetorical comparisons and analogies. Socrates was a great hero, a kind of pagan Christ. He does not appear to have used Aristotle at all.

Unlike his contemporary and admirer the emperor Julian the Apostate, Libanius seems to have had very little use for the philosophy either of the Classical thinkers, or of contemporary Neoplatonists. Declamations with an Athenian setting show that Libanius had a very detailed knowledge of the history, institutions, and customs of classical Athens.

Libanius' writings contain very few allusions to historical events later than the reign of Alexander the Great. Though he – like most free inhabitants of the empire by the 4th century – was a Roman citizen, and though his life was shaped by decisions of Roman emperors and officials, he showed no interest whatsoever in things Roman, seeing Roman and Latin law as the dangerous rivals of the Greek rhetorical education, based as it was on close familiarity with Classical Greek authors, which it was his life's work to maintain and propagate. In the realms of politics he appreciated the need for an emperor and empire to keep off barbarians and to uphold law and order within the borders, but his personal allegiance was to his birthplace rather than to the empire. More particularly he mistrusted Constantinople as an upstart that was draining human and material resources from cities such as his own Antioch. Libanius was a pagan and made no attempt to hide his paganism. But his Hellenic educational ideal had a strong moral component not very different from the moral teaching of Christianity, and his correspondents included Christians as well as pagans. Libanius was honoured by the Christian emperor Theodosius I. Christian and pagan parents alike sent him their sons to educate. John Chrysostom and Theodore of Mopsuestia were almost certainly his pupils; Basil and Gregory of Nazianzus are likely to have been.

The life and career of Libanius thus illustrate the peaceful coexistence of Christians and pagans in an age better known for religious conflict; and his work as a teacher actively contributed to the assimilation of Hellenic traditions into a Greek Christian civilization.

Biography

Born at Antioch in 314, Libanius was educated in Athens and taught rhetoric at Constantinople and Nicomedia. He declined the offer of a chair of rhetoric at Athens but accepted one at Antioch where he remained for most of his life. His pupils included many famous men. His surviving works include letters, orations, declamations, and rhetorical exercises. His prose style was much admired by the Byzantines. He died at Antioch c.393.

Libraries

Libraries in the ancient Greek world were an important medium for the preservation and storage of literature. Since books had to be copied individually and by hand, many less popular books were fated to survive in the long term only in the collections of one or two libraries or of the occasional enthusiastic bibliophile.

Private book collections began to exist as soon as written literature multiplied, certainly by the 6th century BC. A book trade must have emerged soon after, dealing in second-hand copies. Booksellers may also have provided – speculatively, or to order – new copies of the latest writings: certainly they did this in later periods. At Athens, already in the 5th century BC, a distinct part of the city market was occupied by booksellers. Quite soon two types of libraries emerged to meet the needs that private collections and the book trade were unable to satisfy.

Schools, mainly philosophical and medical, needed to have permanent access to works that were relevant to the teaching and research they conducted, especially texts compiled by their own teachers. By the 4th century BC we know of two such school libraries. The books now known as the Hippocratic Corpus (anonymous medical texts by many authors, traditionally ascribed to Hippocrates himself) were evidently the nucleus of the working library of the Hippocratic school at Cos – broad-mindedly including several works that adopt the theories of the rival school at Cnidus. The contents of the library of the Peripatetic school led by Aristotle, and after him by Theophrastus, also partly survive, in the form of research texts attributed to these two philosophers themselves, though in several cases they are evidently not the actual authors. This library was bequeathed outside the school by Theophrastus, was not available to later Peripatetics, and was nearly lost for good; its history is outlined by Strabo

(*Geography*, 13. 1. 54).

True public libraries were needed as soon as the range of texts that people wanted to read grew to the point at which a book dealer could not find or supply them all. If it is true that Pisistratus, tyrant of Athens, established a public library, this need must have been felt as early as the mid-6th century BC. The Latin author Aulus Gellius (*Attic Nights*, 7. 17. 3), the only source of information on Pisistratus' library, adds that it was seized and taken to Persia when Xerxes invaded Greece.

But little is known for certain of libraries before Alexander's time. It was under the Hellenistic kings, with their need to establish and assert Greek culture across the Near East, that major public libraries appeared. The Library at Alexandria (closely associated with the Museum), founded by Ptolemy I Soter (reigned 305–283/82 BC), was one of the great libraries of all time, classified in accordance with a system developed by Aristotle and eventually with a stock of 700,000 papyrus rolls, according to Gellius. Ptolemy persuaded the Athenian state to lend the archive copies of Classic Athenian drama for copying. Having received them, the Alexandrian library kept the old manuscripts and sent new copies back to Athens. The 3rd-century BC poet Callimachus worked at the library and was credited with the authorship of the *Pinakes*, "Tables", which were a thematic listing of Greek writings up to his time and a subject catalogue of the Alexandrian library: sadly, only a few fragments survive.

A second great library of the Hellenistic period was founded under the patronage of the Attalid kings of Pergamum. It had grown to 200,000 volumes when Mark Antony seized it and presented it to Cleopatra. From the excavations of Pergamum some details of the floor plan of this library can be reconstructed: three large rooms, with wooden bookcases, held the manuscripts; a fourth room was apparently for readers' use; and there were colonnades that provided an additional location for reading and discussion. Bookcases for papyrus rolls took the form of sets of pigeon holes: rolls had labels hanging from one end, which could be read without removing the roll from its place.

The Seleucid kings also had an important library at Antioch. Two further Hellenistic libraries, that of the kings of Macedon at Pella and that of Mithradates, king of Pontus, were both taken to Rome as booty by victorious generals. The great library at Alexandria was burned (though not completely destroyed, it is thought) by Julius Caesar's troops in 47 BC. Rome's own public libraries – the first was founded in 39 BC – were probably better stocked with Greek than with Latin literature.

In general, Greek libraries continued to flourish under the Roman

empire, and inscriptions and excavations give us occasional clues regarding their operation. They were naturally to be found at centres of Greek learning. The emperor Hadrian founded a magnificent library near the Agora in Athens in AD 131.

Constantinople, the new capital of the Roman empire, eventually became the focus of Greek cultural life. Here it was that Greek literature survived, in libraries and private collections, through medieval times. The emperor Constantius II founded a public library there. Julian added his own book collection to it in AD 362, and it survived until 726.

Linear B

The oldest surviving written record of the Greek language

Linear B is the name given to the script that records the oldest known form of Greek (dated to the 15th to 13th centuries BC) and therefore is most probably the earliest evidence of the Hellenic people. It was used in the royal palaces of Bronze Age Crete and mainland Greece as a means of recording the transactions of the palace economy and administration until the destruction of the Mycenaean palaces. The first Linear B script, written on a clay tablet, was found at Knossos in 1878, and this discovery among other things motivated Arthur Evans, a British archaeologist, to carry out a systematic excavation of the site. Evans's excavations at Knossos from 1900 revealed a palace complex older than the palace at Mycenae excavated by Heinrich Schliemann, and it no longer seemed appropriate to label the civilization of Bronze Age Crete "Mycenaean". Evans named the newly found civilization of Crete "Minoan" after the legendary king Minos. He found three distinctive writing systems at the palace which he named Hieroglyphic (or Picto-graphic), Linear A, and Linear B, according to their physical appearance. Soon Linear B inscriptions were found also at Pylos and other Mycenaean palaces on the mainland, but because they were

assumed to be Minoan they were taken to be evidence of Minoan domination of mainland Greece. However, in 1952 Linear B was deciphered by Michael Ventris, a British amateur, and the language was found to be an old form of Greek. The older hieroglyphic and Linear A inscriptions are still undeciphered, but are thought to represent non-Greek languages.

The Linear B inscriptions were either scratched on clay tablets, labels, and sealings, which were subsequently sundried, or painted on large clay vessels. Of the clay tablets, some are called “page” type and others “palm-leaf” type, after their respective shapes. The page type can measure up to $c.24 \times 11$ cm, whereas the palm-leaf type measures only up to $c.18 \times 4$ cm. There is a sort of hierarchical system among the different classes of clay documents. At least some clay sealings appear to have functioned as delivery notes of goods to various administrative centres. Palm-leaf-type tablets recorded shorter entries and page-type longer ones, and some entries on palm-leaf-type tablets were found to be collected and duplicated on page-type tablets. Clay labels were attached to the containers of sets of tablets to function as indexes. In addition, since the surviving tablets refer only to “this year” and “last year” with no reference to earlier years, it is likely that they were only temporary records for the particular year and that longer-term records were kept on some more perishable material. The inscriptions painted on pottery appear to indicate the places of origin or the producers of the content, most probably wine or olive oil. Most Linear B inscriptions come from Knossos (c.5600), Pylos (c.1200), Thebes (c.420), Mycenae (c.90), and Tiryns (c.80), but a small number of inscriptions have been found also at Chania (tablets and jars), Midea (a sealing), Orchomenus, Gla, Vlichia, Kreusis, Eleusis, Mameloukos Cave, Armenoi, and Mallia (jars).

The clay tablets show the last stage of the script in use, since they were preserved by being baked in the fire that destroyed the palaces which housed them. The dating of the inscriptions is a controversial matter. Those from Knossos are dated to Late Minoan IIIA2 period (c. 1375 BC), while those from mainland sites are dated to Late Helladic IIIB (c. 1200 BC). The tablets from Chania in west Crete, however, are dated to Late Minoan IIIB₁ (c.1275–1250 BC), which brings the Cretan and mainland scribal traditions closer together. The inscribed pottery on the other hand dates from the 15th to 14th centuries BC, which shows that Linear B was invented in the 15th century BC or possibly earlier.

The Linear B script consists of syllabic signs (87), ideograms (c.160), and numerals (1 to 10,000). It was derived from Linear A, a script probably devised for a non-Greek language, and is not well suited to the writing of Greek. All the syllabic signs stand for open syllables, i.e.

single vowels standing on their own or syllables ending in a vowel, most of which consist of one consonant followed by one vowel. This is not a convenient feature for writing Greek which contains many words with consonant clusters and final consonants. When a syllable comprises v(owel) + c(onsonant) or c + v + c, the consonant which closes the syllable is usually omitted (e.g. *te-me-no* for *temenos*; *ka-ko* for *khalkos*), whereas when a syllable consists of c + c + v, it is usually written out as two syllables, the first containing the vowel of the succeeding syllable as a “dead” vowel (e.g. *ko-no-so* for Knossos). Apart from a small number of special signs such as *ha*, *au*, *dwe*, and *pte*, the script can represent only 5 vowels and 12 consonants (transcribed as *d*, *j*, *k*, *m*, *n*, *p*, *q*, *r*, *s*, *t*, *w*, *z*). This increases the difficulty in representing Greek. For example, the transcriptions *a*, *e*, *i*, *o*, *u* can stand for short, long, aspirated (h-), and unaspirated vowels; the transcriptions *ka*, *ke*, *ki*, *ko*, *ku* can stand for k-, kh-, or g-; *pa*, *pe*, *pi*, *po*, *pu* can stand for p-, ph-, or b-; and l- and r- have the same set of signs in common. The resulting writing is not always clear. What provided the most decisive evidence for the successful decipherment was its occasional practice of adding ideograms, which are often visually recognizable, to the words spelt in syllabic signs, such as “horse” and “tripod”. Despite the incomplete nature of the writing, there is sufficient evidence for identifying many dialectal features which show it to be most closely related to the Classical Arcadian and Cypriot dialects.

The contents of the Linear B tablets are mostly lists of people, animals, and goods with short statements, but they do reveal many aspects of palace economy and administration. We can gather from them, for example, the administrative division of the territory, movement of people and livestock, land tenure, offerings to the gods, food rations for workers, production of wool and textiles, production of scented oil, and storage of vessels, utensils, weapons, armour, and chariots. It also appears that the man called *wanax* (“lord”; *anax* in later Greek) was the most powerful person at each palace, and in the Mycenaean pantheon the most prominent divinity was a goddess (or a group of goddesses) called *Potnia* (“Lady”), surrounded by some familiar names such as Zeus, Hera, Poseidon, and Dionysus as well as others totally unknown. Some tablets from Pylos seem to refer to preparations for an attack expected from the sea, offering an interesting glimpse of the last days of the Mycenaean palaces.

Literacy disappears from most of the Greek world after the demise of Linear B until the introduction of the alphabet in the early part of the first millennium BC. However, a sister script known as Cyprominoan, also derived from Linear A, survived in Cyprus, and eventually evolved into the Cypriot Syllabary which remained in use

into the Classical period.

Literacy

The earliest known Greek script is Linear B, an adaptation of the Cretan Linear A to accommodate the sounds of Greek, which was devised, perhaps by Minoans rather than by Mycenaeans, at some unknown date (the oldest surviving examples are probably from the late 14th century BC). Although a few Linear B symbols are found on pottery, it seems to have been primarily a secretarial tool for recording palatial inventories of personnel and property on unbaked clay tablets. (There is no scholarly consensus as to whether the “baleful signs” in a folded tablet mentioned in the *Iliad* (6. 168–69) refer to a Greek lexigraphic script, just possibly Linear B, or semasiographic writing or whether they are simply a Near Eastern element imported into the tale of Bellerophon.) Mycenaean society was, therefore, almost exclusively illiterate, a fact which makes more intelligible the Greeks’ complete loss of the skill of writing after the collapse of Mycenaean institutions in the 12th century. Knowledge of their past was preserved during the Dark Age (c. 1200–700 BC) by oral means, most notably in the material that lies behind the Homeric poems.

An alphabet based upon the Phoenicians’, but with the adaptation of certain signs to symbolize vowels, was created probably through mercantile contacts and possibly as early as the late 9th century (the earliest known description dates from c. 740 BC). Despite the optimism

of many modern scholars, this cannot be proved to have led to widespread literacy throughout the Greek world, even at the most elementary level.

Erection in public places of marble columns inscribed with law codes, first known from the 7th century, did indeed make them available to all, but citizens could rely on intermediaries to read them. Ostracism similarly need not have depended upon common literacy, as the illiterate could have names written for them (a cache has been found of 191 *ostraka* all bearing the name of Themistocles and written in only 14 separate hands). Poetic texts were written down at least as early as the 7th century, but books were always expensive and even in the second half of the 5th century ^{BC} Euripides was considered strange for possessing a few papyrus rolls. Schools, though not the only means of transmitting literacy, seem to have arisen first only in the second half of the 6th century (the earliest specifically attested belong to the early years of the 5th) and were never universal. Society remained largely oral, even reading being performed aloud. Although written records of Olympic victors were reputedly made from 776 ^{BC} and in the late 6th century Attic demes began to keep records of their members, until at least the 4th century ^{BC} legal proceedings were carried out almost exclusively orally, and commercial deals were made by verbal agreements of the parties concerned, the attestation of witnesses, when necessary, being unwritten. There was, moreover, even a distrust of the written word as being more dishonest than the spoken (Isocrates, *Epistles*, 1. 2–3), and Plato, whose inspirational hero Socrates wrote nothing, argues (if *Epistles*, 7 is accepted as genuine) against writing down truly serious things for fear of misuse (344c), and in the *Phaedrus* rightly points out (274e–275b) that literacy militates against memorization.

Although illiteracy seems to have involved no social stigma and created no economic disadvantages even to members of the elite during the Archaic age (c.700–479 ^{BC}), writing and reading (presumably the more common, especially of lapidary texts) became less unusual accomplishments particularly in the last few decades of the period. They were not confined to the upper classes: inscriptions on vases began as early as the second half of the 8th century and became ubiquitous in the 6th; from 593/92 there survive at Abu Simbel graffiti made by Greek mercenaries; curse tablets first appeared in the 6th century; and even though the earliest known exchange of historical letters in Greek (those of Polycrates of Samos and king Amasis of Egypt) dates only from the 520s, there has been discovered on the island of Berezan, in the estuary of the Bug near Olbia, from only some 20 years later a letter in Milesian Ionic from a private individual (admittedly poorly written, on lead, and probably

not even by the sender). Sappho and her circle in late 7th-century Lesbos, though probably exceptional, show that literacy was not exclusively a male preserve. Nevertheless, W.V. Harris concludes that in the Archaic Age "it would be astonishing if as much as 10 per cent of the population as a whole was literate" in any way.

In the Classical period (479–323 BC) there was clearly a great disparity in literacy between city and country, but not necessarily between large and small cities (the minor city of Mycalessus in Boeotia possessed at least three schools in 413, although their type is not mentioned). Most of the known evidence is from Athens, Pericles' "School of Hellas", and thus may be misleading for Greece as a whole. Nevertheless, although Sparta with its need for permanent military preparedness placed little emphasis upon reading and writing, there is evidence that Athens was not atypical (except in its fondness for monumental public inscriptions which need not, however, reflect either a high rate of literacy or democratic policies). Accepting the leadership of the Delian League in 478/77, Athens needed to keep written records (partially surviving) of members' contributions; from 425 are attested both the earliest written manumission and the earliest written litigant's pleading and from about that time, or possibly a little earlier, the first political pamphlet ("The Old Oligarch"); in the last quarter of the century booksellers began to appear; in the last decade a law was passed prohibiting the use of unwritten laws and a state archive was established; by c.360 written service and apprenticeship contracts and large loan agreements had appeared and written testimony was required in court; c.330 standard texts of the tragedians were placed in the state archives.

During this period literacy for the whole population, including slaves (some of whom were literate), probably reached little more than 10 per cent, but few urban, adult, free males could be expected to be entirely ignorant of letters. The very word *agrammatos* came into existence and signified both "illiterate" and "uncultivated"; Euripides' lost *Theseus* contained a scene whose appreciation was possible only through a knowledge of the shapes of letters of the alphabet; Xenophon in his *Oeconomicus* takes it for granted that not only the landowner Ischomachus but also his wife are literate; Aristotle claims (*Politics*, 1338a15–17) that literacy is useful for "business, running the household, learning and many civic activities".

In the Hellenistic period (323–31 BC) literacy among urban freeborn men reached perhaps 40 per cent. From one area, Egypt, there survive for the first time written ephemera in the form of documents and letters of minor officials and common people, although it is somewhat hazardous to extrapolate from here to the rest of the Greek world. Clearly paperwork (on papyrus) was increasing greatly and was being

used for even fairly trivial purposes. However, the many hundreds of documents (at least 1500 from the Hellenistic, Roman and early Byzantine periods) that explicitly mention the illiteracy of one or more of the parties suggest that the majority of male farmers and artisans were unable to write, and that only a very tiny proportion of their wives could. For the elite, however, literacy was now a *sine qua non*, and institutional libraries, initially probably modelled on Aristotle's at the Lyceum, were established, most notably at Alexandria and Pergamum.

Despite growing bureaucratization and interest in buying books, evident from papyrus finds in Egypt, the percentage of literate Greeks perhaps declined slightly under Roman rule (Harris believes that the peak had been passed by the mid-2nd century BC), as certainly did that of all inhabitants of the Roman empire after c.AD 200. It is notable that a village clerk in Egypt was still ineptly practising his signature formula while in office at some point between AD 184 and 187; and that in AD 263 a rich woman considered her literacy sufficiently exceptional to be ground for requesting privileges from the prefect of Egypt.

Logic

Logic, the study of valid inference, was developed by Greek philosophers as a result of their interest in arguments of every kind, not only those used in philosophy, but also those used in mathematics, in politics, or in the lawcourts. The first technical term for what we now call "logic" was used by Aristotle, and this was "dialectic"; the first occurrence of the ancient term "logic", meaning the discipline of

correct reasoning, is to be found in Aristotle's commentator Alexander of Aphrodisias.

Aristotle is traditionally considered to be the founder of logic. At the end of his *Sophistical Refutations* he himself claimed with some pride to have been the first to conceive of a systematic treatment of correct inference as such and to formulate its rules. But Aristotle was certainly not the first to be concerned with valid reasoning. Before Aristotle philosophers knew how to argue and taught others how to argue; for they were mainly interested in producing arguments to defend their theses or to refute those of their opponents. What is more, already before Aristotle philosophers were aware, and availed themselves, of certain abstract patterns of inference which would ensure the conclusiveness of arguments constructed according to them. Thus it is clear from our sources that already Zeno of Elea in his paradoxes made use of argument patterns like that of the reduction to the impossible. Similarly Plato, in the second part of his dialogue *Parmenides*, obviously inspired by Zeno, constructed an elaborate argument, following a complex formal pattern which explicitly is said to be applicable to any other philosophical subject or discussion. Quite generally, even if Plato might have been averse to the study of reasoning for its own sake, his dialogues present argument systematically set forth in such a way as to make their validity apparent, but also to invite reflection on their validity, rather than simply on the truth of their premises and conclusions. For instance, given Plato's and his followers' concern with the method of division, one easily sees how one would come to formulate general principles of the kind "if A is a genus of B, and B is a genus of C, then A is a genus of C". But to develop such a body of general principles is not yet to provide a formal account of valid inference, an account which identifies what precisely it is about an inference which makes it valid.

Aristotle's logical writings were later known under the collective title *Organon*, i.e. an instrument of philosophy, for they were regarded as the works to be studied first, since it is by means of logic that we come to have the knowledge about reality and human behaviour which constitutes philosophy. But not all of the six treatises of the *Organon* deal with logic in the modern sense. The first of these works, namely the *Categories*, classifies the different types of predicates and is often interpreted as a metaphysical or dialectical treatise, rather than as a logical one. Those editors who placed it in the *Organon* thought that it dealt with the terms of propositions of the form "A is B". The *Topics* discusses dialectical arguments of the kind used in the dialectical exercises which formed an important part of the philosophical training in Plato's Academy. The *Sophistical Refutations* is an appendix to the *Topics* and considers logical fallacies. The

Posterior Analytics investigates the special requirements that scientifically demonstrative arguments have to satisfy beyond being formally valid. Hence, Aristotle's main contributions to the discipline of logic in the modern sense are to be found, first, in his short treatise *On Interpretation*, which presents his theory of the structure of propositions, their truth conditions, and the logical relations between them, in particular their contradictoriness, and their contrariety; and second, in the *Prior Analytics*, in which Aristotle expounds his theory of the syllogism, by considering different kinds of arguments according to their forms.

It is important to note that in his logical writings Aristotle was the first to use letters ("A", "B", "C") to stand in place of the terms of propositions ("white", "animal", "man"). This Aristotelian innovation is regarded by modern logicians as one of the crucial steps in the history of logic, because it implies an awareness of the distinction between logical form and logical matter, and also marks a significant simplification in the representation of the form of arguments. More specifically, in Aristotle's *On Interpretation* four kinds of proposition are distinguished: universal affirmatives, of the form "A holds of every B" (e.g. "white holds of every man"); universal negatives, of the form "A holds of no B" (e.g. "white holds of no man"); particular affirmatives, of the form "A holds of some B" (e.g. "white holds of some man"); and particular negatives, of the form "A does not hold of some B" (e.g. "white does not hold of some man"). A convention going back to the Middle Ages marks each of the four kinds of proposition with a vowel, and thus they may be abbreviated as "AaB", "AeB", "AiB", "AoB", respectively. The universal affirmative is contrary to the universal negative and contradictory to the particular negative, whereas the particular affirmative is contrary to the particular negative and contradictory to the universal negative.

It is next in the *Prior Analytics* that Aristotle presents his theory of the syllogism, by any account one of the greatest achievements in the history of logic. He starts with his standard definition of a syllogism as an argument in which certain things being posited something different from the things posited comes about by necessity, in virtue of the fact that the things posited are so. Hence three distinct propositions are involved in every syllogism, two premises and a conclusion, and they must be related in the appropriate way to be specified. To begin with, the two premises must have a term in common, the so-called "middle term", and the two terms of the conclusion, i.e. "the extremes", must each appear in one of the premises. Thus the three propositions of any syllogism exhibit altogether precisely three terms, and the premises may, as a pair, show any one of the following structures: (1) A of B, B of C; (2) B of A, B of C; (3) A of B, C of B. These three structures

determine the three figures of Aristotelian syllogistic; a syllogism belongs to the first figure if its premisses exhibit structure 1, to the second figure if they exhibit structure 2, and to third figure if they exhibit structure 3. In later times the various forms in which syllogisms may be constructed within the figures came to be called "moods". Aristotle distinguishes 14 valid moods, which are commonly known by their medieval names. For instance, the first valid mood of the first figure is called Barbara and runs as follows: "A holds of every B; B holds of every C; therefore A holds of every C." A typical Aristotelian example in this mood would then be: "Mortal holds of every animal; animal holds of every man; therefore mortal holds of every man." All the valid moods of the first figure are said to be "perfect", because their validity is self-evident. The syllogisms in the other figures are "imperfect", but they can become perfect, inasmuch as they can be reduced to first-figure syllogisms whose validity is self-evident. Aristotle employs three methods of perfection or reduction, which means three ways of proving that a given syllogistic form is valid; namely, transformation by conversion, reduction to the impossible, and exposition. In this way Aristotle presents his syllogistic as a system of deductive inference in which the 14 valid moods of the first, second, and third syllogisms can be reduced to the four moods of the first figure; thus these four syllogistic moods constitute the axioms of the system. The axiomatic character of Aristotle's syllogistic bears clear signs of influence by the developments in the mathematical sciences of his time, and its ingenuity and elegance have often been praised even in our times. Aristotle also made a beginning in what we nowadays call modal logic, i.e. the study of propositions containing modal operators like "necessary" or "possible", but his treatment of modal logic in the *Prior Analytics* proves to be unsatisfactory and presumably in the end incoherent.

Some of the Peripatetics followed Aristotle's interest in logic and tried to elaborate further his logical doctrines. Theophrastus, in particular, is said to have been chiefly concerned with the development of certain aspects of Aristotelian logic, but unfortunately none of his logical works has survived. From later authors we learn that he spent some time on an area of logic that was only briefly mentioned by Aristotle, namely syllogisms "from a hypothesis". These are syllogisms whose first premiss at least is a "hypothetical" proposition, i.e. a negated conjunction or a disjunction or a conditional. In the works of Aristotle's commentators the syllogisms with such premises are called "hypothetical" syllogisms, and are contrasted with the standard Aristotelian syllogisms which are called "categorical" syllogisms. It seems, though, that Theophrastus' account

of hypothetical syllogisms never acquired the character of a fully fledged systematic logical theory: that is, a theory of the kind which the Stoics were to produce later on.

In the Hellenistic period, largely independently of Aristotle's term "logic", the logic of propositions, mainly hypothetical syllogistic, as opposed to categorical, was advanced to its highest level. Its beginnings may be traced back to philosophers like Diodorus Cronus and Philo of Megara, who were not only concerned with the study of logical puzzles or paradoxes, like the Liar and the Sorites, but also put forward original theories about the logical modalities and the truth conditions of conditional propositions. But the logic of propositions was finally systematized by the Stoics, who in Chrysippus had a logician of the highest calibre. His numerous works unfortunately are almost entirely lost, and we need to reconstruct Stoic logic from relatively few and not always reliable fragments. Stoic propositional logic was based on the connectives "if ... then" for conditionals, "either ... or" for exclusive disjunctions, "both ... and" for conjunctions, and the prefixed negative "it is not the case that". The Stoics used ordinal numbers ("the first", "the second", "a", "b") to stand in place not of terms but of simple propositions. Their hypothetical syllogistic, like Aristotle's syllogistic, also was developed as an axiomatic system. It was grounded on five types of "indemonstrable" arguments, i.e. elementary syllogisms the validity of which is in no need of demonstration, since it is self-evident, and four rules, the so-called themata, by the use of which all other syllogisms were claimed to be reducible to the indemonstrables. Hence these rules allow one to establish the formal validity of non-indemonstrable arguments by "analysing" them in one or more steps into one or more indemonstrable arguments. The form of the standard five indemonstrables was expressed as follows: (1) "If the first, then the second; but the first; therefore the second." (2) claimed. "If the first, then the second; but not the second; therefore not the first." (3) "Not both the first and the second; but the first; therefore not the second." (4) "Either the first or the second; but the first; therefore not the second." (5) "Either the first or the second; but not the first; therefore the second." A typical Stoic example of the first indemonstrable is: "If it is day, it is light; but it is day; therefore it is light."

The two systems of logic – term logic and the logic of propositions – were considered by the Peripatetics and the Stoics as rivals, rather than as complementary, each supposed to cover all formally valid arguments. In late antiquity, however, we find the attempt to combine the two traditions of the categorical and the hypothetical syllogistic into one logical system. The commentators on Aristotle's logical works, such as Alexander of Aphrodisias, Ammonius, and Philoponus,

integrated into their works many Stoic elements, including a doctrine of hypothetical syllogisms. Finally, Galen made a more successful attempt to synthesize the two systems in his *Introduction to Logic*, in which he also deals with relational arguments which are not satisfactorily accounted for either by Aristotle or by the Stoics; that is, arguments like “A is greater than B; B is greater than C; therefore A is greater than C.” In general, however, logicians in this period made no substantial logical discoveries, though there are in the writings some terminological innovations. For the most part they stated expansively what Aristotle had stated briefly and elliptically. On the other hand, the logical works of this period preserve historical information, which is invaluable.

Longus

Novelist of the 2nd or 3rd century AD

Longus was the author of *Daphnis and Chloe*, a fine but untypical example of the ancient Greek novel, probably dating from the end of the 2nd or beginning of the 3rd century AD. In outline the story follows the romantic stereotype, narrating the love and adventures of its eponymous heroes, culminating in marriage, and even retains some of the common motifs of the genre, such as pirates, shipwreck, and unwanted rivals. *Daphnis and Chloe* is unique, however, in its pastoral setting: although they turn out to be the exposed children of urban aristocrats, its hero and heroine grow up as goatherd and shepherdess in the countryside of Lesbos, of which Longus was possibly a native. Despite its topographical plausibility, however, the setting is not realistic: Longus draws ostentatiously on the pastoral poetry of

Theocritus (not least for Daphnis' name) and, probably, of Philetas of Cos, after whom one of the most important secondary characters is named. As befits the Lesbian setting, the poetry of Sappho also provides a number of plot elements, notably in an episode where Daphnis fetches Chloe an apple from the highest branches of a tree. The urban reader, in effect, is invited to take a holiday in a literary landscape of bucolic fantasy and turn a blind eye to the hardships of real agricultural life.

Elements of travel and adventure of the kind found in other ancient novels are miniaturized and parodied. Raiding pirates take Daphnis only a few hundred metres before their ship is capsized by performing cows; war nearly breaks out between Mytilene and Methymna after a goat gnaws through a makeshift mooring-rope. This lack of physical movement is related to Longus' most profound innovation: his treatment of love, which he presents as a developing and maturing condition. His lovers begin as completely ignorant of Eros, and only gradually become aware of their feelings for one another. They need to be educated in the "name and deeds of love", first by the old herdsman Philetas, who in lyrically elevated prose identifies Eros as the motive power of all creation, and then by a benevolently predatory sex-starved neighbour, Lycaenion, who gives Daphnis a practical tutorial in the woods. Childish fumbblings give way to formal courtship and marriage in the city, after the two lovers discover their real identities. The lovers' journey is thus an inner one, from the innocence of rural childhood to the knowledge of socialized maturity. The paradigmatically natural quality of their love is stressed by the way it follows the rhythm of the seasons, awakening in spring, growing in summer, resting in winter, and finding its fulfilment in the second autumn; significantly the novel is in four books. Three myths of metamorphosis, narrated by characters in the story and forming a sequence of increasing violence and sexuality, counterpoint the main narrative in the first three books. Implicitly the fourth and final metamorphosis is Chloe's passage from virgin to wife, and the final myth the novel itself.

A preface presents the novel as an *ekphrasis* ("description") of a painting discovered by the narrator while hunting in Lesbos. It also claims – with a mischievous allusion to Thucydides – a universal applicability for its story. The experiences of Daphnis and Chloe are thus an educative allegory of human love and its place in nature, but the novel is also a self-referential meditation on the nature of literary fiction, which, like the love it depicts, and like a pair of symbolic gardens in the story, is a symbiosis of art and nature, artifice and reality.

Although there is no external evidence to date the novel, its lightly

worn erudition and multiple layers of meaning, as well as the artful simplicity of its prose, mark it as a product of the period of the Second Sophistic. The story is set in a timeless Hellenic past, when the two chief cities of Lesbos were independent and war between them was a possibility; there is no attempt to recreate a more precise historical milieu. There is no trace of Rome, but, in its displaced fashion, *Daphnis and Chloe* reflects contemporary concerns with self and sexuality, and, in its ethical but not simplistic confrontation of town and country, echoes a prevalent urban nostalgia for a non-existent bucolic simplicity.

Biography

Otherwise unknown, Longus was the author of the novel *Daphnis and Chloe* which may be dated to the late 2nd or early 3rd century AD. The setting suggests that he may have been a native of or visitor to Lesbos. The style places it in the period of the Second Sophistic. The treatment of love as a developing condition is innovative.

Lucian c.^{AD} 120–180

Prose writer

Lucian of Samosata was by birth a Syrian rather than a Greek but became one of the most important Greek literary figures of his time. He wrote in an exceptionally pure form of the literary language of the 2nd century AD, an Atticizing Greek almost indistinguishable from that of Plato and very different from the non-literary Greek of his day. This purity of style was essential to his success as an orator and travelling speaker in an age where enormous importance was attached to the use of correct Greek at all times. (Two of Lucian's works, *The Mistaken Critic* and *A Slip of the Tongue in Greeting*, are elaborate defences of the author after he had been accused of making, in the course of casual speech, linguistic errors that to us would seem utterly trivial.) The quality of Lucian's language was also one of the main reasons for the continued popularity of his works after his death and their influence on later literature.

Most of Lucian's writings are humorous; they were written to entertain rather than to instruct or defend. Perhaps most famous are the satiric dialogues, in which the author mocks insincere philosophers, the rich, and the major figures of classical mythology. Thus for example in *The Downward Journey*, which like many of his works is set in Hades, the author depicts the humiliation of a rich tyrant after his death while also making fun of awe-inspiring mythological figures such as Charon and Clotho. In *Zeus Catechized* he shows Zeus confounded by a human who asks how the power of the gods can be compatible with the existence of preordained destiny, and the same problem is discussed in worried tones among the gods themselves in *Zeus Rants*. In *Philosophers for Sale* various philosophical creeds are auctioned off as slaves, and in the *Fisherman* the founders of the major philosophical schools, returning to life in order to punish Lucian for his attacks on philosophy, discover the vices of their current followers and repudiate them.

These works show that Lucian had an extensive knowledge of Greek literature from Homer onwards and no scruples about parodying it, and they remain extremely funny to anyone with the background to appreciate them. Some parodies are also written in a narrative rather than a dialogue format, such as the *True Story*, the tale of an imaginary voyage with fantastic adventures. Less popular nowadays are the panegyrics and the rhetorical exercises in which Lucian shows his oratorical skill by defending an unlikely or indefensible point; his legal speeches were not intended for actual court proceedings, but for show. Many of the works are set in Classical times or contrast the present unfavourably with those times, and the works that most influenced Lucian (Old and New Comedy, Plato's dialogues, and the lost satires of 3rd century BC Cynic Menippus) were all written long

before his own time. Thus both in his archaizing language and in his choice of subject matter Lucian reflects the preoccupation of his day with a distant and glorious Greek past, but at the same time he is conscious of rivalling the Classical authors both in language and in wit.

Lucian's works enjoyed immediate popularity that continued into the late antique period, when he was read by figures such as Libanius, Julian, and Alciphron. With the ascendancy of Christianity his status became problematic; his ridicule of the pagan gods and of moral decadence in general was attractive to the Christians, but his *The Passing of Peregrinus*, a biting satire against a charlatan philosopher who had been for a time a Christian, includes some unflattering comments about Christianity and the folly of its practitioners. Although mild compared to the opprobrium Lucian heaped on other groups, these comments drew the ire of many Byzantine Christian writers; thus for example in the influential 10th-century lexicon known as the *Suda* Lucian is identified as "Lucian of Samosata, also called the blasphemer or the slanderer, or rather the atheist" and condemned in the strongest terms. It is significant, however, that Lucian merits a place in the lexicon despite its author's obvious dislike of him, and another large Byzantine manual, Photios's 9th century *Library*, contains no mention of the anti-Christian material and simply praises Lucian's style and his attacks on immorality and paganism.

In the end, however, it was not Lucian's beliefs but the quality of his writing that ensured his popularity among Byzantine writers. They admired and imitated his language, judging it the equal of Classical Attic (it receives elaborate praise from authors as diverse as Photios and the 12th century Gregory of Corinth), and they continued to read and laugh at his satires, which some later Byzantine writers (among them Theodoros Prodromos and Manuel Philes) also attempted to imitate. His influence contributed to the development of a genre of satirical dialogues and another of descriptions of imaginary voyages.

ELEANOR DICKEY

Biography

Born at Samosata in Syria around AD 120, Lucian was a prolific and influential writer of Atticizing Greek. Little is known of his life, but he seems to have travelled a good deal and to have spent time in Athens and later in Egypt. Among his writings the satiric dialogues are best known, and his prose style was much admired by the Byzantines. He died around 180.

Lyceum

Site of Aristotle's Peripatetic school in Athens

The Lyceum was one of the main public gymnasia in Athens, named after the sanctuary dedicated to Apollo (Lykeios). In the 5th and 4th centuries BC various Sophists lectured in the Lyceum and Socrates spent time there too. Here Aristotle founded his own school in 336/35 BC. For a long time the exact location of the Lyceum was a matter of speculation. In 1996 the foundations of a large building were discovered in Odos Regillis containing a palaestra which must have belonged to a great gymnasium, plausibly identified as that of the Lyceum. The identification is supported by the date, the use, and the construction of the gymnasium and it corresponds with written sources on the location of the Lyceum.

There is no direct evidence for the motives behind the foundation of Aristotle's school, but it is arguable that Aristotle wanted to influence philosophical education in a way that was not possible in the Academy. Aristotle's school was called "Peripatos" by the members of the school itself. It is more likely that the school was named after the site of the gymnasium than from the activity of walking. Aristotle, unlike Plato, was a metic and thus he could not own property. Theophrastus, Aristotle's successor, though a metic, acquired property with the help of Demetrius of Phaleron. Theophrastus' will (*Diogenes Laertius*, 5. 51–57) is very informative about the architecture and the outlook of the school. The scholarch was the legal owner of the school, which relied on his financial means. The core of the instruction was the scholarch's lectures, but Aristotle also trained his students in dialectic and rhetoric. Aristotle's esoteric works represent to a great extent the lecture material. The Peripatos, like the Academy, did not require adherence to a set of doctrines. Aristotle's views were modified or questioned by early and later Peripatetics alike.

The first generation of Peripatetics is characterized by extraordinary productivity and diversity. Theophrastus became head of the Lyceum when Aristotle left Athens on the death of Alexander the Great in 323 BC. His voluminous works show a clear concern to continue and develop Aristotelian philosophy. It is controversial whether Theophrastus consciously departed from Aristotle's views, but he certainly rejected Aristotle's god, the unmoved mover, although he

retained a belief in the divinity of the heavens and the eternity of the world. Theophrastus was preoccupied primarily with natural science but he also showed a keen interest in ethics and rhetoric. He is well known for his *Characters*, and he presumably foreshadowed later developments in Stoic ethics. Important Peripatetics of Theophrastus' generation included Dicaearchus, Aristoxenus, Eudemus, Clearchus of Soli, Phaenias of Eresus, and Chamaeleon. These early Peripatetics showed a strong interest in cultural topics, such as literary criticism (Chamaeleon), rhetoric, and biography (Dicaearchus, Aristoxenus, Phaenias, Clearchus), and their writings were probably used by the Alexandrian scholars a century later. Following Aristotle, they also showed a strong interest in the history of philosophy, logic, and natural science.

The Hellenistic Peripatos was less prominent than its rival philosophical schools. Strato (scholarch 287–269 BC) became known as “the natural philosopher”. He rejected Aristotle’s theory of place and maintained the existence of the void in the world. Anticipating the Stoics, he made nature and not god the ultimate cause of all phenomena and like earlier Peripatetics (Dicaearchus, Aristoxenus) he maintained the materiality of the soul. Strato’s successor Lyco (299–225 BC) is a rather insignificant figure. He tried to revive the school and to attract more students by focusing again on ethical issues, fashionable among the Hellenistic schools. After Lyco the Peripatos declined rapidly and there is no evidence of any serious philosophical activity until the 1st century BC. Hieronymus of Rhodes is better known than Lyco’s successor Aristo of Cos for his theory that happiness consists in freedom from pain. Critolaus (2nd century BC) resumed metaphysics; he modified the Aristotelian doctrine of providence, extending it into the sublunary world, while he also claimed that soul and intelligence consist of ether.

In the 1st century BC the Peripatos enjoyed a revival with Andronicus of Rhodes, the acclaimed editor of Aristotle’s works. Signs of a recovery were evident before Andronicus. Ariston and Cratippus, both pupils of the Academic Antiochus of Ascalon, abandoned the Academy for the Peripatos. Yet there is no evidence that any of them (including Andronicus) ever became head of the Peripatos. Like the Academy and the Stoa, the Peripatos presumably ceased to exist after the sack of Athens by Sulla in 87/86 BC. Yet the desertion of Aristo and Cratippus makes sense only if some form of Peripatetic school existed. The decline and the revival of the Peripatos are traditionally associated with the fortunes of Aristotle’s writings. It has been argued that after Theophrastus the Peripatetics had only Aristotle’s exoteric writings at their disposal, whereas his esoteric treatises came to light due to Andronicus’ editorial activity. Andronicus received help from the

grammarian Tyrranio who provided him with copies of Aristotle's works found in the library of Appelicon which were first moved to Athens and after the sack of the city by Sulla to Rome (*Strabo*, 13. 1. 54; Plutarch, *Sulla*, 4). There Andronicus prepared his edition which included the esoteric works in a certain arrangement and was furnished with commentaries on some treatises and a catalogue. Yet it is not safe to assume that Andronicus was the first to make Aristotle's works available after many centuries or that their present arrangement goes back to him. With Andronicus and his circle (Boethus, Xenarchus) a conscious attempt was made to present Aristotle's philosophy as a system, and to explain real or apparent discrepancies in his writings. From this time on Aristotle's works would be read and commented on by philosophers of all schools, but it was not Andronicus' new edition with triggered this.

There is meagre evidence for any philosophical activity of Peripatetics after Andronicus. Nicolaus of Damascus (64, BC–AD 4) wrote a compendium of Aristotle's teaching. To the 1st century AD presumably belongs the Peripatetic Aristocles of Messene who wrote a long work *On Philosophy* in which he recounts the development of philosophy and criticizes Sceptics, Epicureans, and Cyrenaics. A substantial revival of Aristotelian philosophy took place in the 2nd century AD with Adrastus, Aspasius, and especially with Alexander of Aphrodisias. Both Adrastus and Aspasius wrote a number of commentaries on Aristotle's works. Other Peripatetics of this period include Sosigenes, Herminus, and Alexander of Mytilene, all of them teachers of Alexander of Aphrodisias. Marcus Aurelius set up chairs of philosophy in AD 176 and the first Peripatetic incumbent was Alexander of Damascus. His successor, Alexander of Aphrodisias, excelled as a commentator on Aristotle and he had a strong impact even among Platonists. Although Alexander's contribution is very significant, especially in logic and metaphysics, no pupils of his are mentioned. After him nothing more is heard of the Peripatetics. With the introduction of Aristotle into the Neoplatonic curriculum, Aristotle was appropriated by the Platonists who now undertook the writing of commentaries. Aristotle's works, especially the *Organon*, now served as an introduction to Platonist philosophy. This change of the Platonists' attitude to Aristotle is to be associated mainly with Porphyry and Iamblichus (3rd–4th centuries AD). Aristotle was seen through Platonist eyes and this version of Aristotle was the one that was inherited by the Middle Ages and the Renaissance.

Lycia

Region of southwest Asia Minor

The Lycians may have had contact with the Greek world in the Bronze Age, to judge from scattered archaeological remains. Contact had been re-established by the 8th century BC, when the Lycians borrowed their alphabet from the Rhodian Greeks. In the east of Lycia in the 7th century BC there was a strong Rhodian presence, including the cities of Rhodiapolis, Corydalla, Gagae, and Phaselis, though only Phaselis maintained a distinct Greek character through the Classical period.

In mythology and cult Lycia was early associated with Apollo, who had an epithet Lykeios, and was sometimes said to have been born there; an oracular site is known as early as Herodotus (I. 182). Lycia also formed the setting for Bellerophon’s encounter with the

Chimaera. The Lycian heroes Sarpedon and Glaucus are highly prominent in *Iliad*, with Sarpedon second only to Hector himself on the Trojan side; one of the classic expositions of the code of the Homeric hero is placed into Sarpedon's mouth, in discussion with Glaucus (*Iliad*, 12, 307–30).

Because of Lycia's important position on the naval route from the eastern Mediterranean to the Aegean, it was strategically of great value, and was often disputed in the struggles between Greek hegemonies and Persia, and then those between the Hellenistic states (and eventually Rome). Alexander the Great invaded Lycia to deny naval bases to Persia, and Ptolemaic Egypt felt it important to maintain control over the area in the 3rd century BC.

Lycia was ruled by a semifeudal aristocratic monarchy, with a number of quasi-independent dynasts being attested (claims that it had a "federal" constitution before the Hellenistic period are unfounded). This system, under Hellenic influence, culminated in individuals such as Pericles of Limyra (c.380–370 BC), who displayed some of the aspects of personal rule later seen in Mausolus of Caria and the successors to Alexander.

From the 6th century BC the Lycians were commissioning Greek (or Greek-trained) artists to produce sculpture for them, though often applying Greek styles to native or oriental themes (note the frequency of the oriental audience scene, e.g. on the "Harpy Tomb" at Xanthus); such commissions may have contributed to the further spread of Greek artistic traditions. By the end of the 5th Century the Lycians had begun to use the Greek language in inscriptions; in the 4th century some Lycians adopted Greek names. The process of Hellenization continued through the following centuries (including some Greek settlement, but to a degree which is difficult to judge), until it reached the point where Cicero could speak of them as "a Greek people" (*In Verrem*, 4. 10. 21). Nevertheless, aspects of Lycian society can be seen feeding into the main Hellenic tradition. The Lycians were pioneers in the use of portraits of living individuals on coinage (in the late 5th century BC), and their blend of Hellenic and oriental influences in their art and architecture can be seen as a microcosm of the Hellenistic world that followed. In particular, early 4th-century Lycian podium tombs with facades imitating Greek temples, such as the "Nereid Monument" at Xanthus and the Heroön of Pericles at Limyra, influenced the Mausoleum of Halicarnassus and ultimately funerary architecture throughout the Hellenistic world.

Several Greek writers are known to have been native Lycians. Leaving aside the semimythical poet Olen, sometimes supposed to be from Xanthus, there was the 4th-century BC historian/ mythographer Menecrates of Xanthus, the 3rd-century BC writer Mnaseas, and the

5th/6th-century AD geographer/historian Capiton of Lycia. Theodectus, a 5th-century BC tragic poet, came from Phaselis, and the late Epicurean philosopher Diogenes (2nd century AD?) was from Oenoanda in north Lycia, where he left a massive inscription detailing his philosophy. Only fragments survive of most of these authors' works, and the same is true of the numerous *Lykiaka* (works on Lycia) written by non-Lycian writers.

After c.200 BC a federal league appeared in Lycia, which was a significant force in eastern Mediterranean politics until Lycia became a Roman province in AD 43, and even after that continued to provide an administrative framework for the region. With the coming of the *pax Romana* Lycia became a quiet backwater, occasionally visited by Roman emperors and high officials (Augustus' heir Gaius Caesar died there in AD 2), which was slipping into economic decline by the 3rd century AD.

Lycophron

Hellenistic poet

Lycophron's claim on our attention rests on a single text, the *Alexandra*, formally a hypertrophic messenger's speech, a dramatic monologue of over 1400 lines reporting the prophecy of the Trojan

War and its aftermath delivered by Cassandra (here Alexandra) when Paris set out for Sparta. Its erudite and lively-minded author is usually identified as Lycophron of Chalcis, the contemporary of Callimachus who organized the texts of comedy for the Alexandrian library under Ptolemy II (282–246 BC) and composed not only numerous tragedies (of which merely one fragment and 20 titles survive), but also a satyr play with a contemporary subject, his teacher Menedemus of Eretria (see Snell, *Tragicorum Graecorum Fragmenta*, vol. 1, no.100). The traditional attribution has been questioned because the poem's references to a widely acknowledged Roman supremacy (1226–80 and, probably, 1446–50) appear incompatible with a date in the first half of the 3rd century BC, and some have therefore argued for composition in the early 2nd century BC, whether pseudepigraphically or by a younger poet of the same name; but it is more likely that these passages are later interpolations (see below).

The poem presents the matter of Troy from the Trojan standpoint; Cassandra's peculiar perspective is crucially important. Greek achievement is persistently denigrated, Greek misfortune stressed. Relatively little space (31–386) is devoted to the war itself and to Troy's downfall; here Cassandra concentrates on what concerns her family and herself, culminating with the horror of Ajax' assault when she had taken sanctuary in Athena's temple. In expiation for his act of sacrilege the Greek host undergoes manifold suffering both on the journey home (387–1089) and thereafter (1090–1282); in Locris, Ajax' home-land, his people will pay the penalty for 1000 years (the Locrian maiden tribute). Cassandra's vision then extends to further conflict between Asia and Europe, the Persian Wars, and the victories of Alexander the Great, concluding with the triumphs by land and sea of her (not easily identifiable) kinsman (1283–1450). With immense ingenuity Lycophron works into this framework episodes from other cycles of legend (such as the Argonautica), basic to the Greek cultural identity of his day. Interwoven with relatively familiar narratives, often given a new slant by the narrator's non-Hellenic standpoint, is material relating to the western Mediterranean, the foundation legends of Greek colonies, and strange tales inspired by the attempt to accommodate various native peoples within the Greek ethnographic framework. Wide reading and a magpie mind have resulted in a masterpiece of intertextual virtuosity, rich in colourful and curious detail. A narrative covering more than 1000 years is unified by the Aeschylean and Herodotean theme of the rivalry between Asia and Europe, an immensely grand conception matched by Lycophron's elevated, somewhat Aeschylean style.

The obscurity of Lycophron's manner of expression is often exaggerated, but certainly he must have envisaged erudite readers

prepared to spend time in working out oracular conundrums; the modern reader is seriously handicapped by the loss of much literature which Lycophron could assume to be generally familiar to the educated. In any case, long-standing Indo-European tradition favoured a degree of inaccessibility in prophecy, where the presence of obstacles between the message and its recipient required the latter to exert himself, so that he would be the more likely to value the guidance offered at its proper worth.

Virgil evidently read the *Alexandra* with appreciation; it provided the most obvious model for the extensive use of prophecy to bridge the gap between the heroic age and the poet's own day, and for a narrative of Troy's fall presented from the standpoint of the defeated (though Aeneas' perspective is somewhat different from Cassandra's). To the same period belongs the commentary by Theon of Alexandria from which our scholia derive; without this guidance very much would be unintelligible to us. Though Lycophron does not figure among the authors recommended by Quintilian to aspirant orators, Statius' schoolmaster father apparently included him along with Callimachus in his syllabus (*Silvae*, 5.3. 156f.); he is similarly mentioned as a school author, along with Callimachus and Euphorion, by Clement of Alexandria (*Stromateis*, 5. 50. 3). This difficult, allusive poetry did not lack readers in provincial towns; from Roman Egypt we have papyri representing three separate copies (P.Oxy. 2094 + 3445, 2nd century AD; P.Oxy. 3446, 2nd century AD; P.Mon. 156, 1st-2nd century AD).

The poem's popularity in the Byzantine period, no doubt at least as much due to its wealth of mythological learning as to its literary qualities, is indicated by the proliferation of manuscripts; the Pontifical Institute of Mediaeval Studies in Toronto has produced a list of nearly 150 (see Robert E. Sinkewicz, *Manuscript Listings for the Authors of Classical and Late Antiquity*, microfiche 4, Toronto: Pontifical Institute of Medieval Studies, 1990). It was regular reading in Byzantine schools; Gregory of Corinth recommended the clearer passages of Lycophron (along with Sophocles) as models in the composition of iambs. Eustathios refers to him more than to any other poet apart from Homer, on occasion quoting him without name, his habit only with works that he knew very well (see further M. van der Valk, *Eustathii Archiepiscopi Thessalonicensis Commentarii ad Homeri Iliadem Pertinentes*, vol. 1, Leiden: Brill, 1971, p. LXXXV); it is highly probable that he contemplated composing a commentary on the *Alexandra*.

Lycophron's stock stood very high in the 16th century; nine editions of the *Alexandra* had been published by 1600, and the poem was esteemed by the Pléiade, the erudite circle to which Ronsard

belonged. A steep decline in its standing set in at the beginning of the 19th century, with the invention of the Lycophron Question, which turns on the poem's references to Rome's supremacy. Cassandra's prediction of the manifold tribulations in store for the Greeks concludes with a lengthy passage on the future fame of Aeneas' line settled in Italy (1226–80), an unqualified encomium of the rising power of Rome which in the first half of the 3rd century BC might be thought to indicate authentic prescience. Little attention was paid to this problem until it attracted notice from B.G. Niebuhr and, independently, the Whig politician Charles James Fox. Niebuhr postulated a later Lycophron, writing in the early 2nd century BC after the Roman conquest of Greece; Fox diagnosed interpolation. A further passage is affected; Cassandra's prophecy culminates (1446–50) in the victories of a kinsman of hers, some time after Alexander the Great, “a unique wrestler” who will triumph by land and sea. There is too much detail for this to be taken as an unspecific hope for the future; but the identity of the conquering hero is highly controversial, though there seems currently to be general agreement that he must be a Roman, and probably Titus Quinctius Flamininus, the victor of Cynoscephalae (197 BC), enjoys the strongest support. The surprisingly brief treatment of Alexander's achievements (1439–45) rather suggests that a process of updating led to some curtailment of the original culmination of Cassandra's prophecy; we should expect her to display more interest in the decisive role to be played by a second Alexander in the intercontinental feud initiated by her brother. Thus, though the *Alexandra* is permeated by a sense of historical development over a millennium and creates the expectation of a political or ideological message, we are frustrated by the problem of identifying the figure on whom Cassandra has set her hopes.

STEPHANIE WEST

Biography

Traditionally identified with Lycophron of Chalcis, tragedian and contemporary of Callimachus (early 3rd century BC, but some prefer a 2nd century date). He was the author of one surviving poem, entitled *Alexandra*. It reports the prophecy of Cassandra relating to the Trojan War and its aftermath.

Lysander

Spartan general of the 5th century ^{BC}

A member of a noble family that claimed descent from the founding heroes, the sons of Heracles, Lysander first appears in the sources when appointed to command the Spartan fleet in the east Aegean in 407 ^{BC}. The Spartans' prospects had declined since the renewal of the naval war in 412 ^{BC} after the disastrous failure of the Athenians' expedition to Sicily. Then, with the Athenians' allies beginning to secede and the Persians contemplating intervention against Athens, the Spartans reacted vigorously by sending a fleet to the west coast of Asia Minor. The Athenians, however, had proved resilient, despite internal dissension, while Spartan admirals were ineffective and failed to establish good relations with the Persian satraps, who supplied some money but failed to commit themselves. In late 411 and 410 ^{BC} the Athenians, inspired by Alcibiades, who had returned from exile to join their fleet, had won two victories, the second off Cyzicus leading to the destruction of a Spartan fleet of 60 ships. They had gone on recovering lost allies and by June 407 ^{BC}, when Alcibiades made a triumphant return to Athens, were looking to complete the restoration of their old naval dominance.

On taking up his command, Lysander was fortunate in that a

Spartan embassy had just returned from Susa, having secured the Persian king's agreement to renew support for Sparta and his appointment of his younger son Cyrus, to take charge of the three western satrapies and of the implementation of the agreement. Lysander at once established good relations with Cyrus, whose support enabled him to refit and strengthen the fleet he took over at Ephesus. By late August it numbered 90 ships. With these he was able to take advantage of Alcibiades' temporary absence at Phocaea and of the inexperience of his deputy to destroy 22 of his 100 ships, a victory that led to the removal from his command of Alcibiades, who never returned to Athens.

At the end of the year, under the Spartan system, Lysander was replaced. His successor, Callicratidas, obstructed by Lysander's supporters, fell out with Cyrus and was defeated off the Arginusae islands. In consequence both Cyrus and their Greek allies urged the Spartans to restore Lysander to the command and they responded by giving him effective control for the year 405 BC as the nominal second-in-command to Aracus. Cyrus, whose original funds had long been exhausted, somehow found the money to enable him to rebuild his fleet; in the late summer, after some clever manoeuvring in the central Aegean, he reached the Hellespont (the Dardanelles) ahead of the Athenian fleet, taking Lampsacus by assault and from there threatening to intercept the ships bringing Athens' corn supplies from the Black Sea. The Athenians followed him into the straits and, to avoid having to battle continually with the powerful southwest-flowing current, based themselves on an unsuitable beach at Aegospotami. On four successive days they rowed out to offer battle, but without response, and on the fifth Lysander, who had observed how the Athenians, after beaching their ships in the evenings, had scattered in search of food or rest, waited for them to retire and then ordered his ships to attack. All but 10 of the Athenians' 180 ships were taken with little resistance in what was truly a decisive victory. It was the last fleet that the Athenians could muster, but until that evening they could still have avoided defeat and even won the war.

Lysander then toured the Aegean, driving Athenian settlers back to increase the hungry mouths at home and removing their friends from power in the various cities, and then brought his fleet, now of 150 ships, to Aegina to join the land armies in the final siege of Athens. When surrender terms were agreed in the spring of 404 BC, he sailed into the Piraeus to supervise the demolition of the walls. Soon after he assisted in the establishment of an oligarchic regime, the "Thirty Tyrants", which soon proved cruel and oppressive.

While the Athenians could hardly have expected anything better (and many, no doubt, feared worse), the Spartans' new allies in and

around the Aegean must have hoped for more generous treatment than they now received at the end of a war that the victorious Spartans at the start had declared was undertaken to “free the Greeks” (Thucydides, 1. 129 and 2. 8). Lysander, however, favoured close control, in this very probably looking to secure the allies’ loyalty to himself as much as to Sparta. According to Plutarch (*Lysander*, 5), he was already in 407 BC plotting with local aristocrats to set up decarchies (councils of ten) to rule liberated cities, and after Aegospotami in 405 BC he carried out this policy, installing Spartan Officers (harmosts) in the cities to support the new regimes; Plutarch adds (13) that he assisted in a number of massacres, a generalization illustrated by his later account (19), supported by that of Diodorus (13, 104), of events at Miletus. Lysander’s recall to Sparta and the modification of his policies, probably in 403 BC, failed to convince most of the new allies, who broke away when the Spartan fleet was defeated by the Persians off Cnidus in 394 BC.

Meanwhile in mainland Greece Lysander maintained a hard line. In 403 BC he would have suppressed the resurgent Athenian democrats, had he not been superseded by king Pausanias, who brought an end to civil war with an amnesty and restored the democracy. He remained influential, helping to secure the kingship for Agesilaus II in a disputed succession in 400 BC, but being rejected by him when he accompanied the king on his expedition to protect the Asiatic Greeks against the Persians (396 BC) and the allies assumed that he, not the king, was really in charge. In 395 BC, irked by the independent line taken by the Thebans since Athens’ surrender, he was very probably one of those who persuaded the Spartan leadership to declare war on Thebes on behalf of the Phocians (Plutarch, *Lysander*, 28). This was the Corinthian War, during which the Athenians recovered real independence and the Spartans, under pressure, were restored to their leading position in 387 BC only after regaining Persian support. Lysander was at once sent with an army to collect a Phocian contingent, invade Boeotia, and link up with Pausanias at Haliartus, but on arriving there early he rashly became engaged in a battle and was killed. His personal ambition had done much to damage the Spartan position, but whether he planned to have the rules of the Spartan kingship altered to open it up to leading men outside the two royal houses, such as himself, as was alleged after his death (Plutarch, 30), is doubtful.

Lysander has not had a great impact on the modern world. A type of aircraft that gave good service to the British Royal Air Force in World War II in many regions including Greece was named after him, but this could well have been due to his being included among the “great men” in the marching song *The British Grenadiers*; he probably owed

his presence there to the fact that his name rhymes with Alexander.

T.T.B. RYDER

Biography

Lysander was appointed admiral of the Spartan fleet in 407 BC and won a great victory over the Athenians at Aegospotami in 405, during the Peloponnesian War. Having secured the surrender of Athens in 404 he assisted in the establishment of the “Thirty Tyrants”. At Sparta he secured the kingship for his lover Agesilaus II in 400. In 395 he helped persuade the Spartans to declare war on the Thebans and was himself killed in battle.

Lysias c.459/58–c.375 BC

Athenian orator

Lysias’ father was a Syracusan who, in the mid-5th century BC and on the invitation of Pericles, settled in Athens as a resident alien. He became extremely wealthy, since he was a manufacturer of arms and armour at a time when Athens was almost continuously at war. Lysias himself, with his brother Polemarchus, spent some time at Thurii in southern Italy, but returned to Athens well before the end of the 5th century BC. After being decisively defeated by Sparta, Athens was ruled in 404–403 BC by a group of men who (with Spartan backing) operated as a collective dictatorship and earned the name “the Thirty Tyrants”. They killed Polemarchus, arrested Lysias, and seized all the property held by the family in Athens. Lysias managed to escape, and through his property abroad and rich foreign friends he was able to give significant financial help to the Athenian exiles who eventually expelled the Thirty and restored democracy. He died c.375 BC.

As a resident alien Lysias could not participate directly in Athenian political life, but he was greatly in demand as a speech writer for people involved in litigation, who were required to speak in person, for there were no professional “solicitors” or “barristers” in Athens, and prosecutions for criminal offences were normally conducted by individual citizens motivated by patriotism, officiousness, political ambition, or enmity towards the defendant. Oratory had always been regarded in the Greek world as a major art form, a key to success not only in the courts, but also in councils and assemblies, and from the mid-5th century BC, at least in a democratic city such as Athens, there were rhetoricians who professed to teach oratory to politically ambitious young men.

A generation before Lysias the Athenian Antiphon inaugurated the practice of circulating speeches composed for clients, and Lysias followed this practice. So did other speech writers, and the formal structure of a speech was extended to what are sometimes called political pamphlets but correspond most closely to modern articles in periodicals of general interest. So far as concerns forensic speeches, it is of course impossible to find out the relation between the written text and what was actually said in court. We very rarely know the outcome of a case, but an ancient tradition, originating perhaps in a boast by a friend or a relative of Lysias after his death, alleged that he lost only two cases in his life.

At the end of the 4th century BC there existed no fewer than 425 speeches attributed to Lysias. A high proportion of those attributions is likely to have been false, because in an age where there were no publishers’ contracts, no law of copyright, no royalties, and indeed rather little documentation in general, booksellers (like music sellers in the early 18th century AD) had the profitable habit of ascribing to famous names works actually composed by very obscure authors. In the late 1st century BC literary critics ruled out as spurious – mainly on stylistic, sometimes highly subjective, grounds – practically half the total of speeches sold under the name of Lysias. This was a time of reaction against the over-elaborate, formalized style which had come to dominate Greek oratory, and Lysias came to be admired not only for his spare, lively, and natural style but also for the way in which he seemed to invest a speaker with a character that was consonant with that speaker’s status and likely to make a favourable impression on a jury (which had no presiding judge to sum up or guide it on points of law). In any country nowadays where ancient Greek is taught, selections from Lysias often constitute the learner’s first introduction to Classical Attic prose texts.

In late antiquity Lysias, together with others who have come to be labelled the minor Attic orators, was overshadowed by Demosthenes

(born about the time of Lysias' death), and only 27 speeches attributed to Lysias, plus seven truncated or mutilated, survived into the Middle Ages. They include a funeral speech for the Athenian war dead of a year in the late 390s BC and a portion of a ceremonial speech at the Olympic Games. Plato inserts in his *Phaedrus* a sophistic exercise in paradox which he presents as a composition by Lysias, but whether it is genuine or a clever parody by Plato remains disputed. It is difficult for us to form opinions of our own on the authenticity of any of the surviving speeches except no. 12, which was delivered by Lysias himself, prosecuting a member of the Thirty for the murder of his brother Polemarchus. Some of them, however, exhibit distinctive features of language which cannot all be explained by difference of genre or characterization.

KENNETH DOVER

Biography

Born c.459/58 BC the son of Cephalus, a resident alien (metic) in Athens from Syracuse, Lysias and his brother Polemarchus went to Thurii in southern Italy. They left Thurii after the Athenian military disaster in Sicily and returned to Athens as metics. In 403 both brothers were arrested by the "Thirty Tyrants" and Polemarchus was killed. Lysias escaped and achieved distinction as a speech writer. He died c.375 BC.

Lysippus

Sculptor of the 4th century BC

Lysippus was a sculptor from Sicyon in the Peloponnese. Although Pliny (*Naturalis Historia*, 34. 51) places him in the 113th Olympiad (i.e. 328–325 BC), Lysippus was active long before. For example, his statue of Troilus of Elis, victor in the chariot race at Olympia, is likely to date from soon after 372– 368 BC (Pausanias 6.1.4), and his portrait of Pelopidas, a Theban general, was dedicated by the Thessalians at Delphi c.363/62 BC. Lysippus may have been active as late as 316 BC when he was apparently commissioned to make an amphora for Cassander on the occasion of the foundation of the town of Cassandreia (Athenaeus, 2. 784). This suggests that he was probably born around 390 BC.

Lysippus, like the Athenian Praxiteles, was celebrated in antiquity for his achievement in representing realism (Quintilian, *Institutio Oratoria*, 12. 10. 1–10). Pliny (*Naturalis Historia*, 34. 65) specifically commented on the way that Lysippus represented hair, and noted the way in which he made the heads of his statues smaller than his predecessors. His statues were also said to be slender, which apparently had the effect of making them seem taller. The overall effect, in ancient eyes, was that Lysippus represented men “as they appeared”. His genius is reflected in the fact that ancient art historians considered that he had no teacher; Pliny (*Naturalis Historia*, 34. 61) records the tradition that he was inspired to become a sculptor by the painter Eupompus.

Pliny noted that Lysippus was a prolific sculptor, and some 50 statues have been attributed to his hand. His popularity is reflected in the story that on his death he had 1500 gold coins stored away, one for each of the statues he had created. Such numbers are unlikely and probably represent his influence on his “school”; Pliny (*Naturalis Historia*, 34. 66) accepts that it was hard to distinguish between the works of Lysippus and those of his pupils. Lysippus seems to have made largely bronze statues.

One of his famous statues was a colossal bronze *Heracles* which once stood on the acropolis of the Greek colony of Tarentum in southern Italy. This was carried away to Rome by Fabius Maximus in 209 BC and was displayed on the Capitoline. It was apparently taken to Constantinople, where the Byzantine historian Niketas Choniates described it in the 13th century. This statue has been associated with the marble statue of a muscular *Heracles* leaning on his club that was found in the baths of Caracalla in Rome (it is now in Naples), but this Roman copy was in fact the creation of an Athenian sculptor, Glycon. A second colossal bronze statue, 18.3 m (40 cubits) high, also from Tarentum, could still be seen in the agora of the city in the 1st century AD, and is recorded there by Strabo (6. 3. 1).

As with other Greek sculptors, Lysippus’ works were collected and

copied in the Roman period. Pliny records the tradition that Lysippus' *Apoxyomenos* was removed from in front of the baths of Marcus Agrippa and placed in the bedroom of the admiring emperor Tiberius. One of Lysippus' smaller statues was the *Heracles Epitrapezios*, which by the late 1st century AD was in the private collection of one Novius Vindex and celebrated by both Martial (9. 44) and Statius (*Silvae*, 4. 6. 32–47). The statue, which shows the seated here holding out a drinking cup, had apparently been made for Alexander. Although small-scale Roman copies are known, a large-scale copy was discovered at Alba Fucens in Italy, which might suggest that Lysippus himself produced the same statue type at different scales. Lysippus followed Praxiteles in making a bronze (rather than marble) statue of *Eros* for the Boeotian city of Thespiea; possible Roman copies have been identified.

There is a tradition, undoubtedly erroneous, that Lysippus alone was allowed to create portraits of Alexander. However what is clear is that Lysippus was engaged in making royal portraits and images of members of Alexander's court. This association between Lysippus' home polis of Sicyon and Macedonia can perhaps be explained by the friendship between Aristratus, tyrant of Sicyon and the Macedonian royal family. Lysippus' portraits of Alexander apparently showed the subject with his face turned upwards towards the sky; Plutarch (*Alexander*, 4) noted that Lysippus recorded the main characteristics of Alexander: "the poise of the neck turned slightly to the left and the melting glance of the eyes". Such a pose can be recognized in Hellenistic portraits of Alexander, such as those found at Pella and Pergamum.

One of the monuments that Lysippus created was to commemorate the 25 companions who died in Alexander's victory over the Persians at the river Granicus (in northwest Turkey) in 334 BC. This group, which included a portrait of Alexander, was erected at Dion in Macedonia and is probably to be identified with "Alexander's Squadron", a group mentioned by Pliny. It was carried off to Rome by Quintus Metellus in 148 BC. Another of Lysippus' Macedonian groups was the *Alexander's Hunt* which was dedicated at Delphi. The inscription from the base of this bronze group shows that it was erected by the son of Craterus, one of Alexander's generals.

Biography

Born at Sicyon in the Peloponnese perhaps c.390 BC, Lysippus was active as a sculptor from about 370 to 316 BC. He was prolific: some 50 statues are attributed to him. In antiquity he was celebrated for representing realism. His subjects included

Alexander the Great. His works were popular at Rome.

M

Macedonia

The latest archaeological findings have confirmed that Macedonia took its name from a tribe of tall, Greek-speaking people, the Makednoi (*ma(e)kos* = length). They shared the same religious beliefs as the rest of the Hellenic world but up until the Classical period remained outside the cultural and political development of the southern city states. From the 7th century ^{BC} onwards Makednoi under the leadership of the Temenid dynasty, started to move from the highlands of present Greek western Macedonia to the southeast, initially in the winter pastures of Pieria, expelling, subduing, or assimilating a number of Thracian and Phrygian tribes. By the 5th century the Macedonian kingdom was strong enough to occupy all the lands to the east of the Pindus and to the west of the Strymon river and stretched more or less as far north as the present northern border of Greece. This was achieved through agricultural and military reforms which created an upper class of noble landlords as well as an army of landowning soldiers.

Reform and expansion overlapped with the peak of Athenian domination, resulting in a lengthy period of tension which took many forms. Anxious to exploit rich Macedonian resources, Athens tried to colonize eastern Macedonia, destabilize the ruling dynasty, encourage barbarian invasions, and facilitate disintegration. But it was during the same period of Athenian hegemony that the Macedonian kingdom started to come into closer contact with the southern civilization, Classical art, literature, philosophy, and the Attic dialect. The Macedonian court and nobility, rough and tough pastoralist highlanders, were overwhelmed and easily assimilated into Athenian culture. Even their local dialect, northwestern Greek, was replaced by Attic and left only a handful of written monuments in the form of inscriptions. The presence and work of Zeuxis the painter, Timotheos and Agathon the poets, and, most of all, Euripides secured for Athens what strategy had failed to accomplish: complete and perpetual cultural integration.

Yet “vulgar” Macedonians were not unanimously accepted by “refined” southern Greeks, especially by Athenians, as brethren; occasionally they were classified as “barbarians”. This was not due to some latent but still distinguishable Thracian and Paeonian cultural influences or to local linguistic peculiarities. To a certain extent Athenian reluctance could be attributed to the Macedonians’ rough

manners, their monarchic government, and their delayed appearance on the scene. But the main source of antipathy was more than a century of conflict over eastern Macedonia, Thrace, the Chalcidice colonies, and, of course, the final victorious military involvement of Macedonia in southern affairs from 350 BC onwards, which signalled the end of the Classical period.

Philip II of Macedon was anxious to pacify and unify Greece at any cost – except his own – in order to attack the Persian empire. His dream was fulfilled by his son Alexander III the Great, who in no more than 12 years at the head of a Greek army occupied a major part of the then known world from the Aegean Sea to the frontiers of India. The scientific knowledge derived from his campaigns and explorations was significant. Moreover, the dissemination of Greek culture and language over this vast territory had a tremendous longterm impact on the shaping of the Roman empire, Christendom, and Byzantium. But Alexander's own dazzling personality, his adventures among strange peoples, and his unmatched strategic abilities outlived and overshadowed all his cultural achievements. These achievements became the stuff of popular myths, folklore, literature, ideals, and art among eastern and western people, and, above all, they nourished the Greek national imagination.

In the short term the kingdom of Macedonia did not survive as long as Macedonian pride. Although Macedonians gained a sense of superiority and abundant wealth from the east, they simultaneously experienced a dramatic demographic haemorrhage of manpower due to the Asian campaign and later on due to emigration to Syria and Egypt. During the wars of Alexander's successors and the Celtic invasion (279 BC) the country also suffered from relentless plundering and war indemnities. Moreover these endless and bloody wars alienated Alexander's generals individually from each other and collectively from the southern Greeks. In less than two centuries (323–148 BC) Macedonia was steadily reduced from a glorious world empire to a Roman province.

In 168 BC the Roman legions dealt a fatal and lasting blow to Macedonian autonomy. Macedonia was stripped of its possessions and was divided into four administrative districts. In 148, after an ill-prepared revolt, it was reunited and officially integrated within the Roman empire. The presence of legions however did not discourage barbarian invasions. It was only between the end of the Roman Civil Wars (31 BC) and the early Gothic raids (later 3rd century AD) that Macedonia enjoyed the benefits of the *Pax Augusta*, and especially the advantages of the Via Egnatia. It was during the same period that its numerous old and new gods made way for the rapid Christianization of the region.

Magic

In one form or another, magical beliefs and rituals have always found a place in the Greek tradition, although it must be said that magic, as a distinct and easily recognizable category, is one no longer readily accepted by modern scholarship. For the sake of the present discussion, however, and while acknowledging the considerable debate on the topic, it may be understood in the present context to indicate that end of a continuous and largely undifferentiated spectrum of religious thought and behaviour deemed unacceptable to the dominant culture at any given period because of the purposes for which it is employed, because of the methods and the powers it is believed to use, and because of the assumptions it makes about the nature of the cosmos.

The ancient Greek religious tradition included a vast array of magical techniques through which it was believed that people could attain material enrichment and success; could protect themselves against misfortune, ill health, and malice; could discover normally hidden information; or could cause those they wanted to love them and those they hated to suffer or die. Indeed, it seems likely that most people's religious beliefs and practices contained much that may be categorized at the magical end of the spectrum. In an atmosphere of general uncertainty, insecurity, and helplessness, magic claimed to provide a method that worked directly and relatively dependably to solve all the problems, difficulties, and unfulfilled aspirations of everyday life.

Firm evidence of belief in magical power and practice goes back to the earliest Greek literature although this undoubtedly represents a far

older tradition in prehistory: Circe, in Homer's *Odyssey*, for example, knows how to summon spirits of the dead and uses magic rituals to transform humans into animals, while in myth Medea possessed the power of the evil eye and can cause all manner of harm by magical means. Important references to magical practices and beliefs are found in literature from the entire span of ancient Greek culture, for example in Hesiod, Plato, Aristotle, Theocritus, Apollonius of Rhodes, Plutarch, Lucian, Plotinus, and Iamblichus. Knowledge derived from this material is supplemented by archaeological artefacts, in particular curse tablets, figurines, and amuletic gemstones. The most detailed information concerning magic in the older Hellenic tradition comes, however, from the Greek magical papyri that originate in Egypt and date between the 2nd century BC and the 5th century AD. This very rich collection of material demonstrates clearly that the Greek tradition of magic cannot be taken in isolation from the Egyptian, Jewish, and other near Eastern traditions, and confirms that magic was practised at many different levels, from villages to courts, and by practitioners ranging from itinerant to highly institutionalized individuals.

The magic revealed by these sources is primarily concerned with using the supernatural forces believed to control and influence the world in which humans exist, whether these are gods and goddesses, intermediary powers such as angels, demons, and decans, or spirits of the dead. Those associated with nature, such as solar and astral powers, feature prominently, while in the papyri, with their particular cultural context, the Jewish god Iao is most frequently named; but in general the forces of the underworld (notably Hecate) were undoubtedly those thought most helpful and potent. Magical practice, ranging from the crude and casual to the elaborate and formal, was thought to be empowered in almost all cases by a combination of speech and ritual action. Although sometimes no more than vestigial at a low level, these words and actions, which often involved overt symbolic linkage to the desired outcome, were underpinned at the most complex end of the scale by a vast system of knowledge of numerous levels of often highly individualized supernatural powers, and of the names, words, and practices to make them responsive or submissive. It was vital to know all the natural materials (animal, vegetable, or mineral) thought to be particularly favourable or potent in relation to the purposes of the magic in hand and either sympathetic or anti-pathetic to the powers being used; important too was knowledge of correct timing (generally determined by complicated astrological lore) and location (e.g. a crossroad or a place of violent death). Just as most people today, however, use modern technology with almost no knowledge of the underlying scientific theory, so most who employed magical techniques in the ancient

world had no real understanding of their formal and complex intellectual basis.

For the purposes of analysis, magical practice in the Greek tradition may be said to fall into one of three general categories: protection, manipulation, and the discovery of normally hidden knowledge. For protection, amulets were most commonly used. These operated at all levels from individual to communal and were either worn on the body or placed strategically, on the doorpost of a house, for example, or on a city gate. All manner of materials were used, but all were thought to have some special apotropaic efficacy, whether physical or symbolic; this might be increased by combining elements, by adding written formulae, and by preparing them at the proper time and place.

Best known among the enormous range of popular techniques of magical manipulation, particularly for ill, is the use of curse tablets and “voodoo dolls”. In the former case imprecatory and magical formulae were most often inscribed on a lead tablet that was then associated with the enforcing powers by, for example, being inserted in a tomb or buried at a crossroads. The tablet was also frequently “bound” or “fixed” symbolically during the ritual, perhaps being tied with elaborately knotted thread, or pierced with a nail. Practices involving magical figurines were generally similar, although wax or clay might be used and rituals of piercing and binding were often more complicated; symbolic melting or severing of the image might occur and it might be associated with the victim by using personal materials (hair, nail clippings, etc.) and by inscribing personal names on specific body parts. In both cases ritual action was carefully timed and located and was accompanied by equally elaborate verbal elements. Such practices were believed to cause general loss of performance (e.g. in oratorical skill or reproductive capacity), illness (physical or mental), overwhelming lust, or even death; these effects might extend not only to humans but to livestock and crops as well. Other manipulatory techniques involved summoning and then compelling supernatural powers or spirits; in their more elaborate forms complex rituals of invocation took place and interaction with the powers might be thought to occur in a trance state or by means of visions seen, perhaps, in the shining surface of a vessel of water or a mirror. The latter practices relate closely to some used for determining hidden knowledge (see the article on Divination). Also related to these manipulatory techniques are the late antique rites of theurgy.

Magistrates

The monarchic political system of Mycenaean Greece was largely superseded during the Dark Age, the powers of the kings being redistributed among various magistrates (*archai*). As so often, our main evidence comes from Classical Athens, though the sheer size of the city makes it wholly exceptional in its great range of offices. A figure of 700 internal offices (*endemoi archai*) and a corrupt figure of 700 external ones (*hyperorioi archai*) are given for the 5th century BC by the *Constitution of Athens* (24.3), the second half of which (chapters 43–62) comprises a summary of the 46 main magistrates and boards of magistrates (adding up to a total of about 320 officials). These include financial officials various sortitive annual officials, the archons, the quadrennial *athlothetai* (officials responsible for the Panathenaea festival), elective and military officials. As many as different magistracies and boards are attested in the sources, adding up to some 450 magistrates (excluding the council, or *Boule*, of 500).

Various laws defined the basic criteria for magistrates at Athens: they were chosen by election or lot; they underwent a preliminary examination (*dokimasia*) before entering office; they served for at least 30 days; and they rendered accounts (*euthynai*) at the end of their term. In addition there was a minimum age-limit of 30; and all *archai*

swore an oath that they would carry out their duties properly and in accordance with the laws. Magistrates regularly served for a period of one year only and in many cases were not eligible for a second term. Those in oligarchic states were chosen from the wealthiest citizens, but at Athens, after a long process of development, eligibility was extended to all four of the Solonian property classes, though formally only members of the first three classes were eligible for office even in the 4th century. Another contrast between oligarchic and democratic states was that magistrates in the former exercised real power, whereas many of those in the latter were essentially administrators, and all were subject to the will of the popular assembly. Magistrates summoned and presided over meetings, prepared the agendas and put motions to the vote, and most importantly executed the decisions of the assembly. To this end they had legal protection and the power to impose small fines on those who resisted them.

The administration of Athens was not hierarchical in structure (though some posts carried far greater prestige than others), and the great majority of magistrates were selected by lot from candidates who volunteered themselves. Sortition was a mark of the radical democracy; in moderate democracies and oligarchies election was the norm. At Athens, going by the figure in the *Constitution of Athens*, some 1100 magistrates were chosen by lot every year (including the 500 members of the council), and about another 100 were elected, from a pool of about 20,000 citizens over 30. This involved a heavy commitment on the part of Athens' citizens, especially since it was forbidden to hold the same sortitive office twice, except in the case of the council (where a man could serve twice but not in successive years). They could, however, be selected for different offices, and in theory, at least, they might therefore serve every other year (since they had to pass their *euthynai* after office before holding another position). The literary sources indeed suggest there was plenty of competition for office, though inscriptional evidence indicates that not all boards of magistrates were always filled, again with the exception of the council. The ten generals (*strategoí*), the most important financial officials and other officials such as the superintendent of the water supply (*epimeletes ton krenon*) were among the 100 or so magistrates who were directly elected, regularly after being proposed by another and with or without their consent. A check on individual power in democracy existed in the form of collegiality – all members of a board of magistrates were equal.

With this mixture of selection by lot and election it was inevitable that the elected officials tended to wield the most power. Down to the 5th century the leading Athenian magistrates were the nine archons. Three archons had taken over the powers of the kings: the *basileus*

(who performed religious duties), the eponymous *archon* (the civilian head of state), and the *polemarchos* (who commanded the army); and alongside these were the six *thesmothetae* (judicial officials). At some point a secretary of the *thesmothetae* was added, so that the archons formed a board of ten (ten or a multiple of ten being the regular figure for boards after Cleisthenes reorganized the citizens into ten tribes). But the power of the archons waned after 487/86, when the method of sortition from an elected short list was introduced, and as the 5th century progressed their place at the head of Athenian politics was taken over by the ten generals. The archons' position declined still further when sortition replaced election at the first stage of selection as well, and in the late 5th and 4th centuries the archons performed mainly religious and judicial functions. However, the power of the generals also declined in the 4th century, as civil magistrates took over the leading role.

Magistrates at Athens were paid in the 5th century, but payment was abolished in 411, except for the archons and members of the council. Overseas officials, who included *arch-ontes*, *episkopoi* ("overseers"), and garrison commanders, were also paid.

The civil magistrates at Sparta, and in several Dorian states, were called the ephors ("overseers"). The annually elected board of five ephors wielded considerable executive, judicial, and disciplinary powers, among them the right to control the conduct of the two kings. Evidence exists for the survival of the ephorate until at least the 3rd century AD.

In the Hellenistic period, although democracy was espoused and new cities were established with a council, assembly, and magistrates, as also was the revamped Achaean League of the early 3rd century BC, the balance of power very definitely shifted towards the wealthy. The kings paid professional magistrates, and there were numerous high- and low-ranking officials. The former tended to be Macedonians and Greeks, the latter natives, though by the 2nd century BC natives were beginning to rise to higher office.

Despite the advent of Roman rule, much responsibility was left to local communities. The power of the wealthy was consolidated by the institution of wealth qualifications for office, and to the end of antiquity the cities of the Roman empire tended to be ruled by local magistrates.

Magna Graecia

“Magna Graecia”, the Latin translation of the Greek *Megale Hellas*, was the conventional name for the Greek colonies in southern Italy, which were to provide Rome with its first contacts with Greek culture. The term first appears in 5th century BC writings and is used to refer to the Greek world as a whole. The earliest instance of its use to indicate the Greeks of Italy is in Polybius (2. 39.1), writing in the 2nd century BC but referring to the banishment of the Pythagoreans and subsequent formation of the Italiote League by Greek cities in the region of Italy which was known as *Megale Hellas*. By the 1st century BC the name was in common usage among Greek and Latin authors and referred to the territory stretching from Cumae near Naples in the north to Tarentum (Greek Taras) in the south, but excluding Sicily.

The first western Greeks came from Euboea where the chief cities were Chalcis and Eretria, and their first colonial foundation was Pithecusae on Ischia in the bay of Naples. The site of Pithecusae is at the northwest extremity of the island, the acropolis being Monte di Vico, with the cemetery in the adjacent Valle San Montano and beyond it on the Mezzavia hill, a suburban area. Excavations began in 1952, under the direction of Giorgio Buchner. The best-known find is the so-called “Nestor Cup”, a drinking cup of Rhodian manufacture placed around 720 BC in the cremation grave of a boy about ten years old. The cup bears a three-line retrograde inscription in the Greek alphabet of Chalcis, the second and third lines of which are hexameters, and it reads, “Nestor had a fine drinking cup, but anyone who drinks from this cup will soon be struck with desire for fair-crowned Aphrodite.” This is one of the earliest examples of the Greek alphabet, and the only surviving excerpt of Greek verse from the period when the Homeric epics made the transition from oral to written poetry. Scraps of Phoenician inscriptions have also been found, indicating that Pithecusae’s population included Phoenicians; indeed David Ridgway has suggested that the boy whose grave yielded the “Nestor Cup” may have been of Levantine extraction. Buchner thought that these Levantine residents were not merchants, but rather artists and craftsmen commissioned by the Greeks to work in the orientalizing style.

According to Strabo, the Eretrians and Chalcidians at Pithecusae quarreled, which may be a reflection of the hostilities between their mother cities, and the Eretrians left. In any case, the first foundation on the mainland was Chalcidian, at Cumae, opposite Ischia, some 20 km west of Naples. The site has a steep acropolis and good farmland nearby, but no harbour, though it has been suggested that an ancient harbour may have silted up. The pottery from the earliest Greek tombs at Cumae dates to shortly before 725 BC and the colony's foundation date is probably slightly earlier. The site's chief attraction was its proximity to the markets of central Italy, which bought not only Greek manufacturers but also objects from Syria and Phoenicia. Parthenope, on the site of Naples, and Dicearchia, Roman Puteoli (modern Pozzuoli), founded between Naples and Cumae (c.530 BC) by Samians fleeing the tyranny of Polycrates at home, were both within the Cumaean orbit. Chalcidians from Zancle (modern Messina) along with emigrants driven by famine from Chalcis and Messenians from the Peloponnese also founded Rhegium (modern Reggio Calabria), thereby consolidating the Euboean grip on the trade route up Italy's west coast.

The instep of Italy first attracted the Archaeans from the northwest Peloponnese, who founded Sybaris c.720 BC, which commanded a fertile plain as well as a good commercial location, for it was the southern terminus for an overland route to the Tyrhenian Sea, and was well placed to profit from the east-west trade route along the south coast of Italy. The city's wealth was famous; so also was its utter destruction by its neighbour Croton (modern Crotone) in 510 BC which diverted the river Crathis over the site. The city was refounded in 443 BC as Thurii by Athens, although the colonists were a Panhellenic group which included the historian Herodotus. Croton, founded about 710 BC commanded a fertile but smaller agricultural area as well as a small double harbour. The philosopher Pythagoras migrated there when his homeland, Samos, fell under the tyranny of Polycrates, and founded a brotherhood which supported oligarchic government and was driven out by a popular uprising in the mid-5th century BC. Croton in turn founded Caulonia (modern Monasterace Marina) on the south shore of the toe of Italy. The earliest pottery found there dates to the early 7th century BC, but nothing indicates extensive settlement before the mid-6th century. Some 9.5 km southwest of Caulonia, at Capo Colonna, is the temple of Hera Lacinia of which a single column and some foundation blocks remain. It was the meeting-place of the Italiote League until it was dissolved by the tyrant of Syracuse, Dionysius I, when he invaded Italy in the 390s.

Another Achaean foundation was Metapontum (modern Metaponto), some 48 km west of Taranto. Its sanctuary area, marked

off by a circuit wall, contains ruins of temples (A, B, C, D, and E), the largest of which (temple A), dedicated to Lycian Apollo (580 BC, reconstructed 530 BC), yielded the first examples of polychrome terracotta revetments which are a feature of Archaic temple rooftops in Magna Graecia. North 3.2 km from Metaponto is the so-called "Tavole Palatine", a temple of Hera (6 × 12 columns) built about 500 BC on a low hill where there had been a native settlement. Five Doric columns on the south side and ten on the north remain standing. The last major Achaean site was Posidonia (later Paestum, modern Pesto), which was founded by Sybaris on the coast of the Tyrrhennian Sea some 80 km southeast of Cumae. The site has three well-preserved temples, the mid-6th-century "Basilica" (actually a temple of Hera), the so-called "Temple of Neptune" a century later, which was also a Heraion, and the "Temple of Ceres" (late 6th century) which was probably dedicated to Athena. The area was a centre for the worship of Argive Hera, as is suggested by the discovery of a sanctuary at the mouth of the river Sele, 13 km distant, with several temples and treasuries, the largest of which was a Heraion, a Doric building of 500 BC or slightly earlier. The sanctuary must date before the late 7th century BC, for Corinthian pottery of that period has been found there.

In the 670s Locris in central Greece founded Locri Epizephyrii on the eastcoast of Calabria. The earliest remains have not been found, but in the Classical and Hellenistic periods Locri, sited between the coastline and the hills of the interior, grew into a city covering 230 hectares, protected by a wall 7.5 km long. But the city which maintained its independence from Rome longest was Taras, or Tarentum, to give it its Latin name, remains of which lie beneath modern Taranto on a fine peninsular site with an superb harbour. Tradition told that it was founded in 706 BC by *parthenioi* from Sparta who were the bastard offspring of helots and Spartan women begotten while the Spartan army was away suppressing the revolt of Messenia. It suffered a calamitous defeat c.473 BC at the hands of the native Messapians, the worst defeat ever suffered by a Greek army, according to Herodotus (7. 170), but it recovered to become physically the largest city in Italy a century later, and leader of a revived Italiot League. Taras in turn, together with Thurii, founded Heraclea (433/32 BC) west of Metapontum, which marked the rebirth of the only Ionian settlement in the area, Siris, which had been destroyed in the mid-6th century by its Dorian neighbours Metapontum, Croton, and Sybaris. Siris had been founded about 650 BC by refugees from Colophon in Ionia, fleeing from the Lydians. A steep hill with a flat top at modern Policoro, the site of Heraclea, has yielded evidence of a great mudbrick wall of shortly after 700 BC, and this may mark the location of Siris. The last south Italian colony was Elea, Roman Velia, founded

c.535 BC on Posidonian territory by Phoceans from Asia Minor after they had lost their city to the Persians. Elea was to produce one of the most rigorous Presocratic philosophers, Parmenides, the founder of the Eleatic school.

By the 4th century Oscan-speaking Sabellian people were filtering south into Apulia, Lucania (modern Basilicata), and Bruttium (modern Calabria). They captured Cumae in 421 BC, expelling or killing most of the Greek inhabitants, and eleven years later they took Posidonia, renaming it Paestum. Naples admitted its Oscan inhabitants to the citizenship and perforce allowed them a share of political control, but it remained substantially a Greek city. Elsewhere, the foray of Dionysius I in the 390s meant that Croton, Caulonia, Rhegium, and Locri fell under the rule of Syracuse and were garrisoned by Syracusan troops for 12 years before they could eject them. Taras escaped Dionysius' aggression, however, and in the 4th century ranked as the chief city of Magna Graecia, a distinction owed in part to its leading statesman, Archytas, a Pythagorean philosopher who was a friend of Plato and intervened to deliver him from house arrest when he made his second visit to Syracuse with the vain hope of making Dionysius II an ideal statesman.

The threat from its Italic neighbours spurred Taras to bring in a series of *condottieri* from Greece. A Spartan king Archidamas campaigned with some success in 343–338 BC. Alexander the Great's brother-in-law, Alexander I the Molossian from Epirus who arrived in 334 BC, achieved more, and even made a treaty with Rome, but his personal ambitions made him suspect and the Greeks were relieved when he was killed in battle in 330 BC. His territorial gains were lost after his death. The most famous of these generals was Pyrrhus, also from Epirus, who arrived with 22,500 infantry, 3000 cavalry, and a corps of 20 Indian war elephants. He won two victories at Heraclea and Ausculum over the Romans, which cost him heavy casualties and made the term "Pyrrhic victory" a byword. Then, failing to make a peace treaty with Rome, he abandoned Italy at the invitation of Syracuse to campaign in Sicily against Carthage. He returned with a reduced force in 275 BC for a last battle against Rome at Malventum (later Beneventum) where he was outnumbered and suffered a decisive defeat, after which he left Italy for good. Tarentum, as it was henceforth, held out three more years before Rome conquered it. By then the other city states of Magna Graecia were already allies of the Roman people, and, since most were ports and commanded forests in their hinterlands, they formed the nucleus of Rome's naval allies.

Rome had early connections with Magna Graecia. It learned the Chalcidian Greek alphabet from Cumae, and developed the Latin alphabet from it. It may also have learned the name "Graeci" (i.e.

“Greek”) there as well, for among Cumae’s original settlers was a contingent of *Graioi* from a small state in eastern Boeotia. Tradition also connects early Rome with the Cumaean Sibyl whose cave was discovered in 1932, for Rome preserved a collection of oracles called the “Sibylline Books” in the temple of Capitoline Jupiter until it was burned in 83 BC; these had been sold by the Sibyl to Tarquinius Priscus, an Etruscan king of Rome. Livius Andronicus (c.284–204 BC), whose translation of the *Odyssey* into Latin marks the beginning of Roman literature, was probably a Tarentine Greek who was taken to Rome after the capture of Tarentum in 272 BC. But Magna Graecia did not enter the Roman imperial orbit until the Second Samnite War when a Roman army besieged Naples (327/26 BC) which was surrendered by a pro-Roman group in the city, and signed a treaty of alliance on very favourable terms. By the 290s Rome’s web of alliances stretched into Lucania and Apulia and cities which had supported the Samnites were conquered. Velia was taken in 293 BC. At Paestum a Latin colony was installed in 273 BC, and a forum, complete with a temple of Jupiter Capitolinus, was cut into the middle of the city plan. The fall of Tarentum and the peace treaty that followed probably mark the end of the Italiote League. However, when Hannibal invaded Italy and defeated Rome disastrously at Cannae (216 BC), Tarentum, Thurii, Croton, Locri, and Meta-pontum, all leading members of the old Italiote League, went over to the Carthaginians, while further north the alliances remained firm. Cumae, which had held the status of Roman “citizenship without the vote” since its capture by Rome in 334 BC, resisted all pressure to defect, and the alliance with Naples remained firm. In the south, however, only Rhegium remained a loyal ally.

Details of Rome’s settlement of Magna Graecia after Hannibal’s defeat are scant, but Tarentum, which had been sacked in 209 BC, was put under military government for a couple of decades after the war. Croton and Thurii received colonies. A good deal of land was confiscated, and became *ager publicus*, land owned by the Roman people, much of which was to be allotted to Roman settlers by the Gracchi brothers, and later by Pompey and the emperor Nero. The Social War between Rome and its allies in the early 1st century BC marked the end of the Greek cities as nominally free states: after 89 BC they formed part of the Roman state either as colonies (*coloniae*) or municipalities (*municipia*). The final act came with the emperor Augustus who divided Italy into 11 regions. Magna Graecia was broken up among three regions and lumped together with its ancient enemies, the Sabellian peoples.

But that was not quite the end. In the years after Hannibal’s defeat, the interest of Rome’s elite in Greek culture increased rapidly along

with its wealth, and villas sprouted around the bay of Naples. Greek culture, however, now flowed for the most part directly from Greece and not through the medium of Magna Graecia.

Mallia

Town in Crete

The archaeological site and modern town of Mallia is located on the island of Crete, less than 40 km east of Herakleion. It lies within a narrow plain on the northern coast that is bounded to the south by the Dikte mountain range dominated by Mount Selena (1559 m), the site of the Bronze Age peak sanctuary, which rises steeply behind the little church of Prophitis Ilias. From ancient times to the present day the area surrounding Mallia, including the plain, the mountains, and the valleys leading to them, has been characterized by its rich agriculture. Today, the produce includes potatoes, olives, and other fruits, as well as cereals. The herding of sheep and goats as well as traditional cheese making continues to be practised in the mountains to the south. Fishing is also an important activity along the coastal plain and there is evidence of two ancient harbours in the vicinity that would have served both fishing and sea trade in Minoan times.

Mallia is famous today as the site of the third greatest Minoan palace after those at Knossos and Phaestus. The presence of antiquities at the site was first discovered in the late 19th century after a shepherd found some gold leaf by the sea and the local inhabitants

began digging for Minoan treasure. In 1915 Joseph Hazzidakis, then ephor of Cretan antiquities, began a more formal exploration of the site. Since 1922, however, systematic excavations have been undertaken by a team from the École Archéologique Française d'Athènes, led by Fernand Chapouthier, Jean Charbonneaux, and others. By 1932 the excavation of the palace was completed. The French archaeologists continue their excavations in the Minoan town and ancient cemeteries by the sea, publishing the results of their investigations in the series *Études Crétoises*.

While the palace at Mallia lacks the mythological fame of Knossos and is less sumptuously decorated and smaller in size (nearly 8900 sq m or about the size of the palace of Phaestus), it is beautifully sited with a view of the sea. It is also remarkable for having its ground plan preserved virtually intact and, unlike Knossos, it remains unreconstructed. Concrete and iron supports as well as protective roofs have been used only where necessary to preserve the Minoan buildings, providing visitors with a unique opportunity to experience the ancient architecture without controversial modern interventions.

The earliest traces of habitation at the site of Mallia are prepalatial, dating to the Early Minoan III–Middle Minoan IA period (c.2300–1900 BC). The first phase of the palace, known as the Old Palace, dates from the Middle Minoan IBII period (1900–1700 BC) and is contemporary with the Old Palaces at Knossos and Phaestus – all of which were destroyed by a large earthquake at the end of the Middle Minoan II period. The Old Palace at Mallia is known mainly from some large plastered rooms in the northwestern corner that were richly appointed. It was from there rooms that the famous sword with the pommel covered by gold and decorated with an arched acrobat in low relief, now in the Herakleion Museum, was found. Also dating from the time of the Old Palace is the unique double row of four circular structures, each built around a central pillar that probably supported a roof, which is located in the southwestern corner of the palace. These structures were most likely used as silos or granaries.

Most of what is visible today, however, belongs to the New Palace, which dates from the Middle Minoan III–Late Minoan IB period (c.1700–1425 BC). Except for the fact that there is no monumental theatral area, this structure has all the characteristics of a typical Minoan palace, including a central court with an unusual open pit for burnt offerings, storage magazines with large pithoi and channels to collect drippings of oil, and a number of ritual chambers including a pillar crypt in the west wing. In one of these chambers, on a floor dating to the Old Palace, were found the ceremonial leopard's-head axe and the large sword with a gilded blade and pommel of crystal and amethyst, both outstanding examples of Minoan craftsmanship

now on display in the Herakleion Museum. Some of the more unusual features of the palace include the pillared hall to the north, probably used for banquets, and the great circular *kernos* (offering-stand) stone, located in the southwestern corner of the central court, which has a large hollow at the centre and 34 smaller ones around the circumference that may have been used for the offering of first fruits to a deity. The New Palace was destroyed in the Late Minoan IB period and subsequent pillaging left few objects of value from this phase for modern excavators. One exception is a remarkable triton shell, carved from chlorite with relief decoration, that was found in the northeastern corner of the palace and now resides in the Archaeological Museum in Agios Nikolaos.

To the north of the palace, French excavators have also brought to light a large open area with a plaster floor, called the Agora, as well as a series of plastered basement rooms with benches, known as the Hypostyle Crypt. The lack of significant finds from these unique structures, which belong to the period of the Old Palace, has led to the suggestion that they served as a kind of council chamber. The Minoan town surrounding these structures and the palace itself is composed of quarters (*quartiers*) belonging to different periods of use. Most of the houses within these quarters are modest but include a number of well-preserved examples of Minoan domestic architecture. An exception, however, is Quartier Minoan whose special significance is indicated by rich finds and buildings from the period of the Old Palace that include a heireyphic archive, a small sanctuary with its furnishing still in situ, and the oldest roofed lustral basin in Crete.

The cemeteries of ancient Mallia are located to the north of the settlement along the seashore. They include a number of early ossuaries as well as some tombs of the Late Minoan III period (c.1390–1070 BC). Most significant, however, is the cemetery of Chrysolakkos (pit of gold), a large rectangular burial enclosure dating to the Middle Minoan IB-II period (1900–1700 BC). The facade of this building is constructed of partly dressed limestone blocks which are among the earliest examples of ashlar masonry on Crete. Although the Chrysolakkos cemetery was plundered by local tomb robbers in the 1880s, it is famous as the source of the well-known gold pendant of two conjoined bees or wasps with a honeycomb (dated c.1700 BC), now in the Herakleion Museum, that was found by Pierre Demargne in 1945. Based on comparisons with this piece, Reynold Higgins once suggested that the hoard of Minoan gold jewellery known as the Aegina Treasure, acquired by the British Museum in 1892, also came from the Chrysolakkos. New finds from Aegina, however, make this theory unlikely. On the beach of the west of the Chrysolakkos, there is also evidence for a sizeable Roman settlement including houses and

tombs as well as an early Byzantine basilica.

Mani

Region in the southern Peloponnese

For the past 1100 years the names Maïni, Braccio di Maina, Vrachion tis Manis, and Mani have demarcated the land which occupies the middle of the three peninsulas in the southern Peloponnese. The peninsula, 75 km in length and 10–20 km in width, consists of the Taygetus massif, the Mediterranean end of the Alpine branch of the Pindus chain. Its southernmost point is the promontory of Tainaro or Cape Matapan, at the same latitude (36 degrees) as southern Italy and the straits of Gibraltar. The ancient name of the Mani was Lakoniki (Laconia).

During centuries of historical upheaval the geography of this isolated and mountainous area, deprived of important natural resources, made it a safe refuge and hideout, the home of a large population with a unique way of life with primitive features. Thus it came to stand out as a separate geographical, historical, and cultural entity.

The Taygetos mountain range divides the Mani into the “sunny” (east) and “shady” (west) parts. The region is also divided traditionally into several large sections with distinctive characteristics.

The northwestern section or Outer Mani has a rich landscape and consists of the lower slopes and highest summits of Taygetus (Profitis Ilias, at 2407 m, is the highest peak in the Peloponnese). The northeastern section Outer Mani has a rich landscape and consists of the lower slopes and highest summits of Taygetus (Profitis Ilias, at 2407m, is the highest peak in the Peloponnese). The northeastern section or Lower Mani has a varied landscape and fine bays, including both the main port of Gytheion and the rocky gorge with the Passava fortress. The southern part of Inner Mani is occupied by the limestone crystalline range of Kato Taygetos, with an arid rocky coastal plateau to the west. It slides down to the Mediterranean at the tiny promontory of Tainaro, which in antiquity was considered to be the gate into Hades.

Archaeological finds (from several coastal caves) indicate that the area was inhabited in the Palaeolithic era, in the Neolithic period (4500–2800 BC, Diros caves, etc.), in the Helladic period (2800–2000 BC, a number of settlements on low hills and plains), and the Middle and Late Helladic periods, when the Achaeans held power. Homer's *Iliad* 1 refers to eight towns in the Mani at the time of the Trojan War. At the same time Cape Tainaron was already an important place of worship dedicated to Helios-Apollo.

The Dorians invaded Lakonike in the 12th century BC, originally settling in Sparta and expanding gradually along the coast. They hemmed in the local populations, incorporating them as *perioikoi* (“dwellers around”) into the military and political system of the Spartan city state. It appears that the *komes*, that is, the small towns and agricultural communities of the peninsula, retained some autonomy and numerous religious practices. Gytheion became the main Spartan port, while at Cape Tainaron, dedicated to the chthonic god Poseidon, there was a sanctuary with a sacred precinct for the conducting of the dead and an oracle of the dead.

When Sparta's power declined, the coastal towns of Lakonike increased their autonomy and from the beginning of the 2nd century BC, with the support of the Romans, formed the League of the Lacedaemonians, with ten towns in the Mani itself. During the Roman period this federation was renamed the League of the Free Laconians and prospered thanks to trade (in marble, porphyry, etc.). Violent earthquake (AD 375) and Gothic raids (AD 395) signalled the end of the ancient period.

Marathon, Battle of

Battle fought between Greeks and Persians in 490 BC

In 490 BC a large Persian expeditionary force under the experienced commander Datis landed at Marathon in Attica not far from Athens. The Athenians and their Plataean allies under Miltiades repulsed the invasion, and so won one of the most famous battles in history. Not all agreed. The renowned historian Theopompus wrote that "the battle at Marathon was not what everyone keeps repeating it was, and all the other things that the city of the Athenians brags about and uses to dupe the Greeks" (in Jacoby, 1962, fr. 153, pp. 569–70; translation by the author). Hence the very nature and significance of the battle is worth reconsidering. In 490 BC an Athenian army some 10,000 strong confronted a much stronger force of Persian infantry and cavalry. The Athenians sent the runner Pheidippides to Sparta requesting help, but in the event they and their Plataean neighbours faced the enemy alone. At Marathon the Athenian and Plataean armies, under the command of Miltiades, waited drawn up in a strong position against which the Persians could not attack even with their superior numbers. Rapidly running out of time, Datis decided to sail direct against Athens. He chose the first night after the full moon to reembark his cavalry, a time-consuming process, and then the majority of his infantry. To cover his movements he stationed the rest of his troops where they could serve as a substantial rearguard. Datis' bold move

was revealed by some Ionian deserters who approached the Athenian camp and said only "the cavalry is away". Fully realizing that Datis was withdrawing, Miltiades ordered his men to their places, ready to attack at first light. Dawn caught the Persians in the middle of their operations, without the time needed to embark their rearguard.

Miltiades promptly ordered the assault, the Athenians on the right and centre and the Plataeans on the left. Their centre was thin, but the wings deeper and stronger. Their line was equal in length to the Persian one, which strongly suggests that the numbers actually engaged were roughly equal, with the Persians probably enjoying some numerical superiority. Little is known of the Persian dispositions except that the Persians and Sacae, a warlike people from Central Asia, formed the very strong centre of the line, which was about 1600 m distant from the Greeks.

After a favourable sacrifice, the Athenians began their advance. Once within bowshot of the Persians, they charged on the run, the boldness of their attack taking the Persians by surprise and reducing the effectiveness of their archers and slingers. Once engaged, the Persians broke the Athenian centre after hard fighting and then pursued the survivors. At the same time the Greek wings routed their opponents, whom they allowed to flee. The Athenians and Plataeans next swung their victorious wings against the Persians and Sacae, converging on the centre in a pincer movement. The Persian centre was already in some disarray owing to the absence of those still pursuing the defeated Athenians opposite them. The Athenians and Plataeans crushed both of the exposed flanks of the Persian centre, whereupon the entire Persian army broke and ran. Some fled towards the great marsh trying to reach the safety of their camp. In their confusion and terror they lost their way and became mired in the marsh, where they suffered their greatest losses. Meanwhile the Athenians pursued the remnant of the centre, cutting them down in their flight until some of them reached the sea. A fierce struggle swirled around the ships, which took on board as many fugitives as possible before shoving off the beach. Although the Athenians failed to stop them, they nevertheless captured seven ships. The casualties were stunningly uneven. The Persians lost some 6400 men, a high proportion of those engaged. Of the Athenians, 192 fell, primarily those holding the centre of the line. Plataean losses are unnoted. After cremation, the Athenian dead were buried in the Soros and the Plataeans in a tumulus nearby.

Miltiades forestalled Datis' dash to Athens by a forced march. Thus thwarted, the Persian fleet returned to Asia Minor. The campaign of Marathon was over. Nonetheless, controversy still surrounds the Persian cavalry. Herodotus repeatedly emphasizes the importance of

cavalry in Persian planning, but no ancient source, literary or epigraphical, mentions horsemen in combat at Marathon, hence they could not have been a factor in it. Their absence is further proof that the battle was a rearguard action.

The Athenians celebrated their victory in an outpouring of literature and art that still inspires today. The glory was not solely Athenian, but Greek. In literature they crafted the famous Marathonian epigrams, brilliant gems of poetry that commemorated the day when Athenian soldiers “saved Greece from seeing the day of slavery”. Even the great tragedian Aeschylus adorned his tombstone not with allusions to his plays but with the notice that he had fought at Marathon. In art the Athenians honoured their patron goddess and themselves by minting exquisite silver tetradrachms portraying Athena crowned with an olive wreath, a sign of simplicity that contrasts with oriental pomp. Prominently displayed in the Stoa Poikile in the Athenian Agora was a dramatic painting of the battle depicting its progress from the outset through the clash of the two armies to the destruction of the Persian force. The most splendid monuments of the victory were architectural. The Athenian treasury at Delphi, which still stands in quiet beauty and dignity, was built from the spoils of the battle. On the Acropolis of Athens stands the Ionic temple of Athena the Victorious, small, elegant, a graceful memorial to a fateful day. Even the modern marathon races of 26 miles have their inspiration in the run of the Athenian messenger who brought news of the victory from Marathon to Athens.

In one sense, Theopompus was right. The battle about which Athens so boasted was not quite the supreme victory that is claimed. It was instead a splendid rearguard engagement of grand proportions. The significance of Marathon was indeed military, but it was also a symbol of the pride of the Greeks in their way of life and a justification of their love of freedom. That is also the legacy of Marathon to the world today, and the years have not dimmed it.

Marble and Other Decorative Stones

Many different decorative stones were used by the ancient Greeks and Romans for construction, sculpture, and small items. The sedimentary rocks, limestone and gypsum, were most important in construction, but the most significant and evocative material was the metamorphic rock marble. Igneous rocks, such as granite and lavas, were used in construction and for small items. We start first with the sedimentary rocks.

Limestone generally forms in the sea, from the accumulation of shells, some microscopic, or by direct chemical precipitation. Greece is particularly rich in limestone because 250 to 145 million years ago it was a region of shallow tropical seas, far from mountains, and limestone production is favoured in this environment. Most limestones are fine-grained and grey, but white, black, red, and even green varieties are known. Limestone is generally layered with beds a few centimetres to a few metres in thickness. The only important mineral in limestone is calcite (calcium carbonate), but the crystals are commonly too small to be seen. The calcite in some limestones is replaced by the related mineral dolomite. This produces a rock that is slightly harder than limestone, but otherwise very similar.

Although much limestone is uniform, breccias are common in many areas. They consist of angular blocks of limestone, set in fine-grained red mudstone. These are formed in limestone caves that are produced by the solution of rock in percolating rainwater. Blocks of limestone fall from the roof and accumulate on the floor of the cave, together with a fine red mud that is the insoluble residue of the limestone. The mixture is later cemented by calcite to form a solid breccia.

Travertine was another type of limestone exploited as a decorative stone and for construction. This commonly porous rock was deposited around many springs in ancient Greece, but has often been completely removed. It is fine-grained and grey when initially deposited, but may develop large crystals later. The fossilized remains of plants that grew around the springs are often preserved in the rock. It forms by the loss of carbon dioxide gas from the spring waters and the consequent precipitation of calcite. Stalagmites, stalactites, and dripstone form in caves in the same way and were also used sparingly as decorative stones.

Gypsum (alabaster) is a soft, pale brown, yellow, or pink rock that may be layered. It was used in Minoan times as a decorative stone in the palace at Knossos, at Akrotiri on Thera, and elsewhere, but soon lost favour. The rock is soluble in water and hence was used only inside buildings: gypsum blocks left open to the weather after the excavations have lost more than 1 cm of material in 30 years. Gypsum was obtained from quarries on the hill of Gypsades near Knossos and

in the underground mines of Gortyn. It was formed by the evaporation of seawater when the Mediterranean dried up about 6 million years ago. Bands in the rock formed during deposition and were folded later by tectonic forces. The presence of calcite or dolomite impurities in some samples increases their strength and resistance to erosion. The finer-grained varieties of gypsum were used for facing stones and for floor slabs, whereas the coarse-grained varieties were used in columns. So-called "Egyptian alabaster" is actually a form of limestone.

Marble is limestone, or more rarely, dolomite whose structure and mineralogical composition have been changed by the action of heat and pressure (metamorphism). Quarry workers and some archaeologists often refer to a number of other softer rocks as marble as well, such as limestone, lavas, and serpentinite, but to a geologist only metamorphosed limestone or dolomite is marble. Marble was an important material for sculpture and building materials in antiquity because it was relatively easy to work, produced a fine edge, and was abundant in many parts of the Aegean region. The ancient Greeks were more interested in white or grey marble, but the Romans also exploited coloured marbles extensively.

Marble is produced in the earth at depths of several kilometres. The source of the heat is the natural increase in temperature with depth in the earth. As the limestones are buried under other rocks, the temperature increases at a rate of about 1°C for each 30 metres. The metamorphism induces the recrystallization of the calcite so that the crystals are visible to the unaided eye and can also lead to the formation of new minerals, and hence change the colour of the rock. The hot rock is much weaker than cold limestone, hence it is commonly deformed without cracking by natural stresses in the earth.

The textures of marble are a combination of those originally present in the limestone and those produced during metamorphism. Layering and breccias in the original limestone are inherited by marble, but metamorphism may deform or smear them. However, deformation can produce new layering and new breccias can form in caves in the marble, giving a myriad of varieties of textures, and textures within textures. Metamorphism can also produce another texture, veining. In the rock there is often a thin film of water between the crystals that is saturated with calcite in solution. If there is a sudden loss of pressure, or increase in stress, then a crack can open up that may soon be filled with relatively pure, white calcite. These veins are a good way to distinguish marble from limestone.

The colour of marble reflects the amounts of minor minerals present because pure calcite and dolomite are white. Red is produced by the mineral haematite, from iron oxide impurities. Grey and black are commonly due to graphite, produced during metamorphism from

organic matter, such as plant or animal remains. These colours can also be produced by magnetite or manganese oxides. The presence of the minerals chlorite, muscovite mica, or serpentine gives green marbles.

White and pale grey marble occurs throughout the Aegean region, but was exploited extensively at only a few locations, for historical and geological reasons. The quarries of Attica supplied the white and grey marble used in Athens. Mount Penteli produced the best white marble, whereas the grey came from Hymettus, but both mountains contain white and grey. The best-known white marble of the Cyclades was that of Paros, known as *lychnites*, because it was mined underground by the light of a lamp. This marble is very pure so that quite thick pieces are translucent. Naxos also produced large quantities of a coarse-grained white marble. The quarries of white, dolomitic marble on Thasos were some of the largest in antiquity. Their exploitation reached a maximum during Roman times, when the marble was widely exported. Pale grey streaky marble from the island of Marmora was very popular since it could be extracted in large blocks.

The best-known green marble was known to the Romans as Marmor Carystium and more recently by the Italian name of Cipollino, because it resembles an onion in section. It was produced from a number of quarries in southern Euboea, around Carystus. It was used for monolithic columns, public fountains, and wall-facings in Roman and Byzantine buildings from the 1st century BC to 7th century AD. It was widely exported all around the Mediterranean and as far as Britain. Cipollino is made of layers rich in calcite separated by layers rich in the green minerals muscovite and chlorite. Quartz and feldspar are also present and stand out from the other softer minerals after erosion.

Rosso Antico is a fine-grained, red to purplish red marble, with some varieties streaked with white veins and patches. It was first extracted from quarries on the Mani peninsula in Minoan and Mycenaean times, between 1700 and 1300 BC, for use in architecture and for stone vases. It was not in regular use again until about AD 50, when as Lapis Taenarius it is found in Roman and later in early Christian buildings, decorating walls and floors. Reused pieces were popular in the Middle Ages and later for floor decorations, and were frequently mistaken for imperial porphyry, an igneous rock from Egypt. The Rosso Antico quarries also yielded white, grey, and green marble, and were also exploited very early, for example in the treasury of Atreus at Mycenae.

Other variegated marbles were exploited at many locations, but in small quantities and mostly during Roman times. The best known were on Skyros, the Fior di Pesca of Euboea, the Africano of Teos, and

the Portasanta of Chios. Yellow marble was imported from the imperial quarries in Tunisia.

Verde Antico is the name given by Italian masons, from the Renaissance onwards, to a green decorative stone that was first used in the 1st century AD, but was most popular in the 5th–6th centuries, after the imperial porphyry quarries in Egypt closed (about AD 450). Its ancient name was Marmor Thessalicum or Marble of Atrax. The quarries lie on a small hill beneath the western slopes of Mount Ossa, just north of Chasambali. Verde Antico is a conglomerate composed of rounded serpentinite and marble blocks set in a fine-grained matrix of similar composition (the geological term for this rock is ophicalcite). The rock is layered, with contrasting sizes and compositions of blocks in the different beds. The blocks were transported by rivers, but could not have traveled far because serpentinite is a very soft rock and hence erodes readily. Therefore, this rock probably formed very rapidly in a broad river valley surrounded by high mountains of serpentinite. This rock was not formed recently, but probably during the Tertiary period and is a variant of the conglomerates seen in the Meteora.

Of the igneous rocks both lava and granite were exploited in antiquity. A widely used green porphyritic rock was known to the Romans as Lapis Lacedaemonius, to Italian masons as Porphido Verde Antico, and to us as Spartan Basalt or Andesite. It was popular in Minoan and Mycenaean times for stone vases and sealstones and under the Roman and Byzantine empires for the decoration of walls and floors. According to Pausanias. “These stones were used for decorating temples, swimming pools, and fountains.” Later, Roman and Byzantine stones were reused extensively, for example in St Mark’s Venice, and Westminster Abbey, London, until the late 18th century. Spartan Porphyry is a porphyritic andesite and comes from a lava dome 2000 metres long of mid-Triassic age (about 230 million years ago) near Krokeai, Laconia. Such domes form when viscous lava erupts quiescently on to the surface. The prominent crystals in the lava are plagioclase, now metamorphosed to a fine-grained mixture of albite and green epidote. Sometimes several plagioclase crystals started to crystallize from the same point, to give rosettes of crystals. In parts of the dome the fine-grained matrix of the rock has been reddened by the oxidation of iron minerals to haematite. This rock is generally highly fractured, with most blocks less than 50 cm in diameter. Similar porphyritic lavas were also exploited locally on Samothrace.

Granite was an important decorative material for the Romans and was traded widely throughout the Mediterranean. There were two major sources of granite in the Aegean: Marmo Misio (or Granito

Bigio) from near Kozac, 15 km northwest of Pergamum, and Marmo Troadense (or Granito Violetto) from Mount Cigri, 10 km southwest of Ezine. Both rocks are grey, fine-grained, and principally composed of quartz, feldspar, and biotite. Both intrusions are about the same age as the volcanic rocks in the region. Plutonic rocks such as granite and lavas such as imperial porphyry from other Roman imperial quarries were imported into Greece in small quantities, especially from Egypt.

It is only recently that the susceptibility of marble and limestone to erosion by pollution has become a problem. The most direct problem is the solution of the mineral calcite in the marble by strong acids (for example sulphuric and nitric acids) present in polluted rain. Some acid gases in the atmosphere also directly attack marble. The most common end product is gypsum, which is more soluble in water than calcite. The transformation of calcite to gypsum also involves an increase in volume, hence the surface of the marble flakes off. Another problem relates to algae that live just below the surface of the marble. They feed off petroleum products deposited from the air and produce acid waste products, with the same results. Sandstones cemented with calcite are also attacked in the same way.

Marriage

Marriage has been a central cultural and economic institution of Hellenic society since antiquity and, while both the practicalities and the perceived function of marriage have undergone various changes, it has demonstrated a remarkable continuity through time. Indeed it has been claimed that the pivotal role of marriage and the family, together with religion, has been a crucial factor in sustaining Greek identity and culture, particularly through the Tourkokratia (see McNeill, 1978: Sanders, 1967).

For antiquity, and for Classical Athens in particular, marriage was informed by two dominant and purposive imperatives: first, the production of legitimate children (*gnesioi*, contrasted with bastards, *nothoi*) for the husband's *oikos* (household, family) and of legitimate citizens for the state; second, the formation and maintenance of social and interfamilial alliances.

The first point finds its mythical illustration in the Athenian legend of Cecrops who, long ago, “found men and women having sexual intercourse at random, so no son could identify his father, and no father his son” (scholion on Aristophanes, *Plutus*, 773). Cecrops rectified this promiscuity by inventing the institution of marriage. Here the critical concern was to clarify lines of patrilineal descent and inheritance, a concern important especially for democratic Athens where legitimacy of birth was a prerequisite of citizenship. The flowering of the Athenian empire in the 5th century BC and the concomitant importance of being Athenian were reflected in the state's unusually narrow marriage regulations; before Pericles' law of 450/51 BC Athenian birth was a requirement of the father only, but after this both parents of legitimate children had to be Athenian. Thus citizen marriage at Athens was endogamous, and exogamy could have legal consequences (Demosthenes 59, a prosecution from the 4th century BC which deals with an Athenian citizen allegedly living as if married with an alien woman, is a good example of the practical consequences of this law against mixed marriages). One product of the importance of legitimacy was the emphasis on female chastity. Brides were expected to be virgins (the Greek word *parthenos* denotes both the unmarried girl and the virgin, social and physical categories that, preferably, coincided) and wives were expected to be chaste.

Also important and perhaps a particular concern for the rich elite was the notion that marriage could forge ties, concentrating power and wealth within social groups. Despite anxieties about incest, endogamy extended to “keeping it within the family”; marriages between first cousins, niece and uncle, and even half-siblings were common and, in Sparta at least, marriage between uterine siblings was sanctioned (Philo, *On Special Laws*, 3. 4).

22). Indeed kinship was a positive factor for marriage: one legal speech brings as proof of a family quarrel the fact that an uncle has not married his daughter to his nephew (Isaeus, 7. 11–12), while another describes the reciprocal giving in marriage of female relatives within a family (Demosthenes, 59. 2). Friendship obligations were important too: another speaker in court describes how his sister was given in marriage to a friend of his dead father as a favour (Isaeus, 2. 3–5). These cases highlight the fact that an Athenian girl was given in a marriage over which her male natal guardian (*kyrios*, normally the

girl's father or, if he was dead, her brother) exercised a formal control; indeed a wife's natal *kyrios* had the power to revoke her marriage, demanding the return of both woman and dowry, and divorce and remarriage were frequent. It was possible too for women to be the objects of bequests in wills (Demosthenes, 27. 5; 45. 28; Diogenes Laertius, 5. 11–16).

Marriage then at Athens can be seen as a form of exchange between households in which women were given out, conditionally, to bear children for their husbands and citizens for Athens, and was crucial for the creation of new households, for the continuation of descent groups, for the city's stock of citizens, and for citizens themselves for whom only marriage provided legitimate heirs.

For women too marriage was crucial and was seen as the fulfilment of a culturally prescribed role, indeed as the only proper role available to women, a notion that has gone largely unchallenged until the very recent past. While temporary celibacy was required of priestesses during the period of religious office, no respectable alternative to marriage and motherhood was available to women, either social or biological; the Greek medical writers envisage a horrendous fate for girls deprived of sex and babies (see in particular the *Peri Partheneion*, part of the Hippocratic corpus which remained influential throughout the medieval period). So strong was the notion that marriage was the only fitting career for a woman that girls who died unmarried were commemorated as brides of Hades.

In ancient Greece the state played no formal role in marriage which was essentially a private arrangement between families. As a result, identifying the definitive moment of the marriage ceremony (*gamos*) becomes somewhat problematic; no state or religious official pronounced the couple married and there was no marriage certificate. The basic signifier of marriage may simply have been for a couple to live together as if married (*synoikein*), and lawcourt speeches of the 4th century BC concerned with legitimacy and inheritance attest to the potential difficulty of deciding whether or not a marriage had taken place. The act of betrothal (*engue*), however, in which the bride was bestowed for the ploughing of legitimate issue, marked the first step of marriage for an Athenian, and only children born of a woman so betrothed, apart from those of an *epikleros* (heiress), were legitimate (Demosthenes, 46. 18; Isaeus, 8. 19). *Engue* was not an irreversible contract (there was no notion of "breach of promise"), but normally was followed by the *ekdosis*, the handing over of the bride by her natal *kyrios* to her new *kyrios*, her husband. *Ekdosis* could happen some time after *engue*; Demosthenes reports that his sister's marriage was delayed by ten years since she was an infant when betrothed, a reminder that girls were married young, ideally shortly after puberty, perhaps to

ensure as far as possible the bride's virginity.

The bride dedicated her childhood toys and a lock of hair to Artemis and was bathed and veiled. Then followed the sacrificial wedding feast during which libations were made to the gods, particularly Hera, the goddess of weddings and marriage and whose own divine union with Zeus was celebrated throughout Greece. The bride was unveiled before her husband who accepted her with his right hand and led her to his house.

Marriage in militaristic Sparta differed markedly from that in democratic Athens. Spartan men were expected to marry in their twenties but lived apart from their families in all-male barracks until the age of 30, encouraged to visit their wives only occasionally, at night and by stealth. The Spartan marriage ceremony was characterized by the real or symbolic rape of the bride who, hair cropped and dressed as a boy, waited in the dark to receive her new husband. Spartan attitudes to female chastity also differed from those of the Athenians. Many texts suggest a more flexible marriage bond and a more relaxed approach to extramarital sex and, while the production of Spartiate soldiers was of vital importance to the state, Spartan custom held that all sons belonged in common to fathers and vice versa. This unconcern with legitimacy was related perhaps to Sparta's inheritance and landowning patterns; until the late 5th century BC the state controlled the allocation of land and thus the male line was not important, a good indication of the way in which marriage and martial behaviour reflect upon other political and social institutions.

Hellenistic Egypt reveals new emphases on marriage as a union of two individuals and on the sexual fidelity of both partners; an Alexandrian marriage contract from 92 BC insists that the husband may have neither concubines nor catamites (Tebtunis papyrus 104). Furthermore, the image of the married couple became a significant feature of Hellenistic rule. Marital alliances among the elite were a traditional feature of Greek society, not only of the royal houses of Sparta and Macedonia but also of aristocratic Athenians, but Hellenistic queens acting as their husbands' consorts, such as Arsinoë the wife of Ptolemy II Philadelphus, took the principle a stage further. Arsinoë was also Ptolemy's sister, and such unions were a strategy for consolidating power within one family, following the Egyptian model. In Byzantium several imperial brides, although not born royal, exercised considerable political and religious influence through marriage and motherhood, often wielding most power as widows. Irene in the 8th century was regent for 5 years, while in the following century Theodora II was regent for 14 years, both women achieving and maintaining power by manipulating their positions as wives and

Massilia

City in southern France

The city of Massilia (modern Marseilles) was located to the east of the Rhône delta, at the end of a long inlet with its entrance facing the Mediterranean sea, in the territory of a Ligurian tribe, the Segobriges. Its position enabled it to participate in, and control, the trade in precious metals from the eastern coast of Spain and the tin route from Britain. The colony was founded by Phocaeans from Asia Minor c.600 BC after they were forced out of their homeland by the Persians. According to Pompeius Trogus, a Gaul of the Vocontii, the foundation legend for the city current in the 1st century BC related that the Greeks sailed up the inlet and there met a tribe of Ligurians led by their king, Nannus. After some negotiation it was agreed that Phocis (or Protis) would marry Gyptis, the daughter of the king, and that the couple

would settle down in Ligurian territory.

The site was known to the Greeks before the establishment of a settlement there, since it had previously served as a trading post for both the Rhodians and the Etruscans on their journeys to and from Spain. At first the inhabitants of the new city were oriented towards the sea, engaging in fishing, trading along the Mediterranean coast, and piracy. Their new settlement served as a base for the trade in metals and as a staging post for Greek traders making the journey from their homeland, with stops at the Sicilian cities to the east, or Massilia, before reaching their final destination. Perhaps it was part of a strategy developed in conjunction with the Phocaeans of Rhegium, who controlled the Straits of Messina, to funnel trade along the northern routes in the Mediterranean in the heyday of Ionian commerce in the late 6th and early 5th centuries BC.

Massilia became very prosperous as a result of this trade. A variety of pottery from the early period has been found at the site, indicating far-reaching contacts with the Greek homeland. Massilia itself soon established colonies in Spain and on the Ligurian coast, including Emporium (Ampurias) and Nicaea (Nice). It also founded Alalia on Corsica c.565 BC, perhaps to allow the Phocaeans to avoid the trade route along the coast of north Africa controlled by the Phoenicians. As a result, Massilia soon became involved in struggles with Carthage and its Etruscan allies in the western Mediterranean, which continued throughout the 6th and 5th centuries; its new colony on Corsica was abandoned in 540 as a result.

Archaeological evidence from recent excavations presents a interesting sequence of pottery at Massilia. Initially, Ionian, East Greek, and Corinthian ceramics were found on the site. This changes quite suddenly in the second quarter of the 6th century BC when Etruscan wares predominate. Soon after that they decline, and in the middle of the 6th century Attic imports take over, especially flourishing after 530. Earlier prestige gifts present at native inland sites consist of Rhodian bronzes, perhaps carried by an overland route through the Alps from Italy; Athenian pottery is not present. Suddenly in the second half of the 6th century wares from Attica appear in the interior. It seems that Athenian ceramics were passing through Massilia, then being transported upriver to sites in the hinterland. The city had begun to broaden its focus of trade, expanding its interests inland rather than concentrating all its commercial efforts on the sea.

In the second half of the 6th century BC Massilia itself developed a strong pottery industry, producing amphorae to transport local wine. In return for this local beverage and luxury goods from Greece, it received grain, amber, and tin. The growing trade up the Rhône valley influenced both the Hallstatt and La Tène cultures of the Celts.

Ligurian and Iberian sites have produced much imported pottery from the late 6th century as well as providing evidence of Greek influence in other areas, such as fortifications, architecture and art, cultivation of the vine and olives, and perhaps even a law code.

Massilia was well known in antiquity for the stability of its oligarchic form of government with its council of 600 (*timouchi*), an additional minor council of 15 members, and three top magistrates, as well as a body of strict Ionian laws transplanted from its homeland (Strabo, 4. 1.5). Aristotle wrote a work, the *Constitution of Massilia*, now lost, which outlined the structure of its government. Massilia retained the cults of its mother city, such as Artemis of Ephesus, Delphinian Apollo, Cybele, and Leucothea. In addition, it maintained a strong connection with its Greek homeland, as well as advertising the city's prosperity and success, by construction of the Treasury of the Massilians at Delphi. Its wealth is also evident from the attractive series of coins minted in the city.

Prosperity appears to have lessened in the 5th century BC as the result of the expansion of Carthaginian power in the Mediterranean (although this view may be altered by finds from recent excavations in the city), but it continued to develop its own products for export, such as wine and olives. The Hellenization of the hinterland was completed by the second third of the century, but the Phocaean role as a civilizing force lasted until at least the late 5th century.

By the 4th century BC trade once again flourished, particularly after the voyage of Pytheas, a Massilian astronomer and geographer, who sailed through the straits of Gibraltar, exploring the west coast of Africa and circumnavigating Great Britain, drawing on the nautical knowledge and geographical information contained in the 6th century work, the *Periplus*.

In the Hellenistic period the Massilians sided with Rome against Carthage, increasing their territory with the Romans' help. Massilia and Rome had an early agreement, which later developed into an official alliance. Massilia was a loyal ally, providing information and ships to Rome in the Second Punic War (218–201 BC), and Rome in return allowed the city to maintain its control over the trade route to Spain. In 125, after aggressive action by local tribes, Massilia appealed to Rome for help, which led to the absorption of the area into the Roman sphere of influence and the formation of the first Gallic province of the Roman empire – Gallia Narbonensis. Little remains of the Greek settlement, the site of which is occupied by the modern city of Marseilles, but there is evidence of a theatre, port facilities, a Hellenistic aqueduct, fortification towers, and a Greek cemetery.

Massilia retained its independence until 49 BC, when it sided with Pompey against Julius Caesar. After Pompey's defeat, Caesar stripped

the city of its fleet, and reduced its treasury and territory, but it retained a certain degree of autonomy due to its status as a *civitas foederata*. Its constitution remained in effect until the 1st century AD when it finally lost its independence to the expanding Roman empire. At that time Massilia's commercial and political power also declined, but it remained a centre of Greek culture and learning until the 6th century AD, ending only with the domination of the Franks.

Mathematics

Though mathematics is in some way the most typical, and is arguably the most enduring, of the achievements of the ancient Greeks, it was not originally their invention. The Greeks themselves believed that geometry had come to them from Egypt (e.g. Herodotus, 2. 109), and Aristotle (*Metaphysics*, 1. 1. 981b23) explained the origins of mathematics in Egypt by the fact that the Egyptian priests were a leisured class, who had time to spend on intellectual pursuits. It is also now known that the Babylonians had an impressive and ancient system of mathematics (though this is noticed hardly at all by ancient Greek sources). The fact, however, that mathematics (if mathematics is taken to mean techniques for manipulating figures and numbers, and expressing relationships between them) was not original to the Greeks does not detract from their achievement of devising the concept of mathematical proof and developing the idea of the

mathematical proof and developing the idea of the mathematical system which takes as its starting point the simplest axioms possible and proceeds from there by a process of rigorous proof to the demonstration of quite complex propositions. The result was to transform mathematics from a subject which was practically useful (and which also might be quite interesting, but only as a by-product) to a discipline which provided a new (and more demanding) paradigm of knowledge, and could be regarded as culturally and intellectually, rather than practically, important. Indeed, there is a rich tradition of anecdotes decrying those who hoped to get practical advantage from the study of mathematics, exemplified by the story told of Euclid by Proclus, that when one of his pupils asked him what was the use of learning mathematics, he told a slave to give the pupil a small coin "since he must profit by what he learns".

Unfortunately, since the works of Euclid are the earliest complete mathematical treatises which survive, and since extant accounts of the work of earlier mathematicians have probably been restated in Euclidean form, the process by which the distinctive features of Greek mathematics developed remains speculative. Though there is some evidence of early work on arithmetic (or more properly number theory), it is only in geometry that the distinctively Greek axiomatization and systematization of mathematics can be seen to its fullest extent. Though there is a persistent tradition that the Pythagoreans were prominent in the early stages of Greek mathematics (the importance given to mathematics in Pythagorean philosophical system certainly seems to have influenced the direction Greek mathematics took) and despite the prominence of individual Pythagorean mathematicians such as Archytas, in general those to whom the earliest discoveries were credited (Thales of Miletus for example) were not Pythagoreans. The earliest mathematicians did not give proofs as rigorous as those demanded later; at any rate, some of the propositions credited to them can be proved only by means of techniques developed much later. Greek mathematicians often made a distinction between the discoverer of a proposition and the person who produced the proof. Hippocrates of Chios (working in the 2nd half of the 5th century BC) was said to have been the first to produce an *Elements*, a systematic arrangement of geometrical theorems in logical order.

In the 5th and 4th centuries BC geometry developed to the point where it became the kind of mathematics recognizable today. The tradition as reported in the sources is that at this period geometry was concerned largely with problems about constructing certain figures, three of which became especially famous.

The first, the duplication of the cube, is sometimes referred to as the

Delian problem, from the story that it originated when an oracle told the people of Delos that they could avert a plague by doubling the size of Apollo's altar, which was cubical; when the mathematics of this proved beyond them, they consulted Plato, who set it as a problem to his students (the story is certainly apocryphal, since Hippocrates of Chios, well before the date of Plato's activity, had reduced the problem to one of finding two mean proportionals in continued proportion between two lines, one twice the length of the other). A number of attempted solutions of this problem have been preserved, including a remarkable one by the Pythagorean Archytas of Tarentum (early 4th century BC), perhaps the first attempt at three-dimensional geometry, involving the intersection of a cylinder, a right cone, and a torus.

The second problem was the squaring of the circle, that is to say the construction of a square having the same area as a given circle. Since a circle (like other curves) can coincide with a straight line only at certain points, and not over any finite distance, the problem of relating areas bounded by straight lines with those bounded by curves inevitably made it necessary for mathematicians to confront the difficulties of handling infinite divisibility and infinitesimal magnitudes (through Hippocrates of Chios' work on the quadrature of lunes – areas cut off by the intersection of two arcs of circles – which contains the oldest geometrical proof to have survived, may have been an attempt, ultimately unsuccessful, to solve it without involving infinitesimals). An allusion to this problem in Aristophanes' *Birds* (line 1005) suggests that it attracted the interest of a wider public. Antiphon, the Athenian Sophist (5th century BC), is said to have tried to find a solution by inscribing within a circle polygons with more and more sides in the hope that they would eventually coincide with the circle; Aristotle treated this approach with open contempt. In the 4th century Bryson used both inscribed and circumscribed polygons which, if it was not simply a more complex application of Antiphon's fallacious approach, may have been an attempt to arrive at a ratio between the two polygons which would represent the area of the circle; if so, it was an important step towards the solution eventually found by Eudoxus. Later mathematicians approached the problem through the use of higher curves.

The third problem, the trisection of any angle (which probably arose from attempts to construct polygons), was approached by the Sophist Hippias of Elis (5th century BC) through the use of the *quadratrix*, one of the first higher curves, the locus of the intersection of the radius of a circle moving through 90 degrees and a straight line at right angles to the original position of the radius moving from the circumference to the centre of the circle uniformly in the same time; it

was also used in a solution to the problem of the squaring of the circle.

Theodorus of Cyrene (late 5th century) did important work on irrational numbers (a problem which was raised initially following the discovery that the relationship between the side and diagonal of a square was the ratio of 1 to the square root of 2, which cannot be expressed by a ratio between any combination of whole numbers), which was developed by his pupil Theaetetus (d. 369 BC) into a general theory of irrationals. At about the same time Eudoxus of Cnidus (first half of the 4th century BC) not only put forward a theory of proportion which would deal with both commensurable and incommensurable magnitudes, but also devised a strategy of proof (usually misleadingly referred to as the “method of exhaustion”) which evaded the problem of indivisible magnitudes, and so opened the way to serious work on figures and solids bounded by curves.

The Hellenistic period, building on the work of the 4th century, was the most creative period of Greek mathematics. The geometry of the previous period was summarized and systematized in the first surviving Greek mathematical work, Euclid's *Elements*. Archimedes (d. 212/11 BC), perhaps the greatest of Greek mathematicians, did impressively innovative work on planes and solids bounded by curves, and extended mathematical methods to mechanics and hydrostatics, and Apollonius of Perge (late 3rd or early 2nd century BC) wrote a definitive work on the geometry of the parabola, the hyperbola, and the ellipse (referred to at this period as conic sections).

Though it was only in geometry that the distinctive Greek concept of formal proof was fully developed, other branches of mathematics were not neglected. Diophantus' *Arithmetica* dealt with problems in algebra, through worked examples and without proof, and Hero of Alexandria demonstrated that he could perform various complicated mathematical operations, including solving quadratic equations by a method quite close to the formula still used. Greek astronomers were familiar with some of the most important trigonometrical functions, and Ptolemy produced a table of chords which expresses the same relationships as a modern sine table.

Although there were no significant new developments in Greek mathematics, or in mathematics in general, until the development of algebra by the Arabs, the work of Italians in the later Middle Ages and the Renaissance (building on the achievement of Diophantus), and the invention of calculus in the 17th century, serious mathematical work continued. Pappus, in the 3rd or 4th century AD, composed a series of works, most of which still survive in a compilation called the *Synagoge* or *Collection*, which consists largely of commentary on and expansion of earlier work, with some new material (which may or may not be

Pappus' own). It is not only an invaluable source for the history of Greek mathematics, but is also good evidence for the continuing vigour of the subject. From the 3rd to the 5th century AD the Neoplatonic school of philosophy (which stressed the metaphysical significance of mathematics, and the spiritual benefits to be gained from studying it) produced a number of commentaries on mathematical works which, though not original in themselves, preserve a great deal which might otherwise have been lost. In particular, Proclus (AD 412–85) wrote a commentary on the first book of Euclid's *Elements*, whose historical sections draw in part on a lost history of mathematics written by Eudemus in the 4th century BC; further information is contained in Proclus' commentaries on various dialogues of Plato. Later, in the 6th century AD, Eutocius produced a series of commentaries on the major works of Archimedes, revealing evidence of vigorous mathematical activity which would otherwise be lost. At about the same time, Anthemius of Tralles, one of the architects of Justinian's Hagia Sophia, was a mathematician of some importance. A surviving fragment of one of his works, *On Burning-Mirrors*, reveals that it was not simply a discussion of an optical device, but a serious contribution to the study of conic sections.

Mausolus

Ruler of Caria in the 4th century BC

In 392 BC Hecatomnus, father of Mausolus, was appointed one of several native satraps who ruled Asia Minor (Anatolia) for the Persian king in the early 4th century BC. Hecatomnus' initial assignments for the Great King were to crush Evagoras, rebel ruler of Cyprus, and to secure Caria against an expansionist Sparta, leader of the Greek states after the Peloponnesian War.

Mausolus became satrap c.377 BC amid a tangled confusion of

Athenian, Spartan, Egyptian, Cyprian, Anatolian, and Persian politics, intrigues, rebellions, and wars. He played an important role in Graeco-Persian politics of his day. In the miscarried revolt of the western satraps (366–359 BC), though himself a rebel, he somehow retained his position and served Persia until his death in 353 BC. In 357–355 BC he supported the Greek rebels in the Social War that ended Athens' Second Confederacy. He at first ruled with his sister (who was also his wife) Artemisia; he ruled alone from 353 to 351 BC. The couple had no children. The ancient sources for the career of Mausolus are his contemporaries Isocrates and Demosthenes, as well as Diodorus Siculus, Dionysius of Halicarnassus, and Arrian.

The King's Peace of 387/86 BC, imposed on the Greeks by King Artaxerxes II (404–358 BC), had placed Anatolia officially under the rule of Persia, a status that endured until the conquests of Alexander the Great in 334 BC. But Athens, temporarily disarmed, still sought to thwart Spartan expansion. Hence the Second Athenian League of 377, formed ostensibly for that purpose.

Mausolus' transfer of his capital from inland Mylasa to Halicarnassus soon after his accession was probably a response to his Athenian confederacy. The new capital gave Caria a prominent maritime base, accessible to Greek commercial and cultural influences. Mausolus now built a navy and constructed on the offshore islet of Zephyrion what has been called the first Hellenistic palace.

The revolt of the western satraps had no single cause. Even after Cyrus was defeated in 401 BC, Egypt still defied the Persian power successfully. In 372 BC Datames, satrap of Cappadocia, asserted his independence. Persia's failure immediately to crush him or the Egyptians raised the hopes of other satraps; some hoped to achieve success by forming alliances with Athens or with Sparta.

In 366 BC Mausolus and Autophradates, satrap of Sardis, were sent against Ariobarzanes, another rebellious satrap. Instead, they joined Agesilaus of Sparta (campaigning to undermine the King's Peace) in supporting Ariobarzanes, and Mausolus paid Agesilaus to supply him with mercenaries of his own. It was money that Mausolus had, in fact, collected as tribute on behalf of the king.

More disaffections from Persian rule occurred, peaking in 362 BC. Phrygia, Armenia, Lycia, Ionia, Lydia, Phoenicia, and Syria joined the revolt. Inexorably, by 359 BC, the Persians had reduced this alliance, but Mausolus was among the satraps who retained their status in defeat.

Athens' aggressiveness in an effort to regain old cleruchies created distrust among the members of its alliance and led to the Social War. Mausolus was aware of the resistant mood of Athens' island confederates in the face of what seemed to be Athens' quest for

another empire. Indeed, according to Demosthenes in 351 BC, it was Mausolus who had incited Chios, Cos, and Rhodes to rebel and Athens' other allies to full revolt. Though Mausolus' intrigues and participation played a part, Athens had brought it on itself. In 355 BC Isocrates had delivered his speech *On the Peace*, urging the Athenians to dissolve their maritime league, and Athens conceded the independence of Cos, Chios, Rhodes, and Byzantium. Mausolus moved in with Carian garrisons and replaced their democratic governments with oligarchies.

To touch Athens was to be Hellenized. As Athens had long ago attached all of Attica to itself by *synoikismos* (political amalgamation of settlements), so Mausolus synoecized Halicarnassus, gathering the native communities into a single coastal city. This was his most significant legacy, as his tomb was his most lasting. During his own lifetime Mausolus supervised a design for his Mausoleum, possibly as a monument to the entire Hecatomnid dynasty. (Oddly, the word for it was originally *mnema* or *taphos* – “monument” or “tomb”.) It was completed by his wife Artemisia, who was also buried there. The Mausoleum was a triumph of Hellenic architecture and sculpture, or more correctly of the Hellenic spirit. Its decoration was the achievement of the four greatest Greek sculptors of the time: Scopas, Leochares, Bryaxis, and Timotheus. It was designed by the architect Pytheus, who had already designed the Ionic temple of Athena at Priene; he was a revolutionary artist with a new vision of sculptural and architectural harmony.

Even with detailed descriptions of the tomb by Pliny the Elder and Vitruvius, much confusion exists. The Mausoleum, about 50 m tall and with a circumference of 150 m, occupied only a small section on an artificial terrace of 105 by 242 m, surrounded by a wall of white marble. On this podium (really the tomb chamber), whose 160,000 building blocks each weighed about 70 tons, were constructed three columned tiers surmounted by a pyramid of 24 steps, on top of which was Pytheus' colossal four-horse chariot of marble. Great stone lions “protected” the pyramid at its base. Each tier had a sculptural frieze and a group of intercolumnar statues in the round, all manifesting a different theme. The friezes depicted Amazons in battle, centaurs, and chariot races. The themes are common, but the chariot frieze might have depicted the actual games held by Artemisia at Mausolus' funeral. On the lowest tier the statues were life size; above, they were one-and-a-third times life size; and at the top they were one-and-two-thirds life size. The splendid portrait statues of Mausolus and Artemisia still survive. These statues, of the largest size, stood within the great sepulchre and not, as generally believed, in the apex chariot. They are now in the British Museum among the numerous sculptures

found by excavators in 1857.

With its new conception of size and space and its colonnades with heroes walking among them, the Mausoleum had great influence over the grandest buildings of the Hellenistic age. Alexander the Great had buried his father in the customary modest Macedonian manner, but after seeing Helicarnassus and the gleaming white tomb of Mausolus in its centre, he built an immense tomb for his friend Hephæstion.

The Mausoleum was still standing in the 12th century. In 1495 the Hospitaller Knights of St John used its stones for their castle (still to be seen in the harbour of modern Bodrum). Today only Mausolus' theatre may be seen; nothing is left of the tomb or palace.

Mausolus' influence is remarkable. He promoted Greek culture – institutions, arts, and language – in southwestern Anatolia. The synoecism of Halicarnassus and the mingling of native Carians and Greek culture were precursors of the Persian–Greek integration credited to Alexander. With his Mausoleum, agora, temples, and theatre, Mausolus bridged the Classical and Hellenistic worlds, as the “last of the satraps and the first of the diadochs”.

DANIEL C. SCAVONE

Biography

The son of Hecatomnus, Mausolus was ruler of Caria from 377 to 353 BC together with his sister (also his wife) Artemisia. With the title satrap, he ruled under Persian auspices. But by moving his capital from Mylasa to Halicarnassus he opened it to Greek cultural influences. Having incited Athens' allies to rebel, he annexed Cos, Chios, Rhodes, and Byzantium. He and Artemisia were buried in the monumental Mausoleum, one of the seven wonders of the ancient world.

Medicine

The earliest sources of detailed Greek medical knowledge are Homer's *Iliad* and *Odyssey*, both written in the 8th century BC. In the *Iliad* Homer mentions 147 different wounds, for most of which he gives detailed and accurate descriptions. Homer also recorded the medical care given to injured warriors, which focused on providing comfort to the wounded soldier rather than treating the wound itself. Among the

warriors some were considered specialists in the art of healing through bandaging and herbal medicine. Two of these specialists were Machaon and Podalirius, who are both described as sons of Asclepius. After Machaon was wounded himself, he was treated by being given a cup of hot wine sprinkled with grated goat cheese and barley. Homer did not discuss any diseases, except for the case of Thersites which contains a typical description of rickets.

An influential development in Greek medicine was the Asclepius cult, which originated in Epidaurus and spread rapidly throughout the 4th century BC. Asclepius, who in the *Iliad* is described only as a skilful physician, was here worshipped as a god of medicine, truth, and prophecy. He was a son of Apollo who had learned the art of healing from the centaur Chiron. The god figure may have been derived from a human Asclepius who is credited with many miracles in healing and lived around 1200 BC.

By the end of the 4th century BC Asclepius was worshipped in about 200 temples, of which those at Epidaurus, Cnidus, Cos, and Pergamum were the most important. The sick would visit the temples for a ritual healing incubation. After purifying themselves through baths, fastings, and sacrifices they slept in a dormitory, or *abaton*, where they were visited in a dream by Asclepius or one of his priests. In the morning the priests would interpret the dream and give advice. Since the priests wanted to ensure that the sick had a chance of recovery, they became skilful in diagnosis. The extent and variety of the temple cures can be seen from the tokens the cured left behind. At the Asclepieion at Epidaurus about 10 cubic m of terracotta replicas of afflicted limbs and organs have been found, illustrating successful case studies. Inscriptions on the temples show that the treatment of diseases consisted of rest, exercise, diet, and magic.

It was not the priests, however, but the Presocratic philosophers, starting with Thales of Miletus (6th century BC), who led the way towards a naturalistic medicine. In the cosmologies of the Presocratics the inner workings of the human body became subject to the very same principles as the outward phenomena. Of special significance is Empedocles of Acragas (c.490–c.435 BC), founder of the medical school in Sicily, whose four-element cosmology (fire, earth, water, air) anticipated the doctrine of the four bodily fluids or humours: blood, phlegm, choler (or yellow bile), and melancholy (or black bile). Just as the order of the universe depended on a harmony of the four elements, so was one healthy when the four humours were in balance.

The views of Empedocles influenced Hippocrates of Cos (c.460–377 BC), who is generally considered the father of medicine. A contemporary of Plato, Hippocrates lived in the golden age of Greek thought and culture. As with many early Greek figures little is known

of his life, and the name may refer to several different people. About 70 medical treatises, generally called the Hippocratic corpus, are traditionally attributed to him, but it is not clear whether he wrote even one of them. The treatises vary greatly in length and style, and it is generally believed that they used to make up the library of a medical school, probably at Cos, which became the most important centre of medical thought and practice in the 4th century BC – a role that was later taken over by Alexandria. Today Hippocrates is best known for the Hippocratic oath, an ethical code that is still upheld, albeit in radically revised versions. According to the original oath, the physician should use medicine solely for the benefit of the patient, abstain from surgery, keep information about the patient confidential, and refrain from asking a fee for teaching others his trade.

The Hippocratic theory built upon the idea of the Presocratic philosophers that man and nature are subject to the same rules and on Empedocles' theory of the four elements. Reliance on the speculative cosmologies of the Presocratic philosophers was crucial to the Hippocratic theory, since physicians could not engage in dissection to familiarize themselves with the inner workings of the human body. Following Empedocles' theory of the four elements, Hippocratic medical practice consisted of restoring the balance of the four humours. To cure a patient one had to make the offending humour escape or balance itself out. The Hippocratic physicians sought to do this primarily through diets, purgation, bloodletting, and draining abscesses.

One interesting element of the Hippocratic corpus, and a clear mark of its scientific character, is that besides successful treatments medical mistakes were also included. This is especially clear in book 5 of the *Epidemics*, which contains case studies of ill-timed purgatives, badly done cauterizations, irritating wound dressings, and others. Some of the Hippocratic methods, such as treating a dislocation of the hip, remained unsurpassed until the 19th century. Part of the corpus, most prominently the *Aphorismi*, was used as a textbook up to the 19th century.

The other two major centres of Greek medicine during this period were Cnidus and Sicily. Two important figures of the school at Cnidus were Euryhon and Ctesias, both contemporaries of Hippocrates. Euryhon made anatomical studies, explained pleurisy as a lung affection, and discovered that haemorrhage can occur from the arteries as well as the veins. He also believed that disease was caused by insufficient evacuation of the faeces. In Sicily Philistion of Locri, who met Plato at Syracuse, did much to diffuse the medical knowledge of the island and to ensure its synthesis with the views at Cnidus and Cos.

Although Aristotle was not a physician himself, his impact on the development of Greek medicine can hardly be overestimated. Born in 384 BC, he was a son of Nicomachus, who was the court physician to Amyntas II, king of Macedon. Aristotle's main contributions concern his development of the scientific method, to which his formal logic added an element of precision, and his work in comparative anatomy and embryology.

After Aristotle the centre of Greek culture shifted to Alexandria, where a famous medical school was established around 330 BC. Important figures of this period were Herophilus and Erasistratus. Both lived during the single brief period in which the ban on human dissection was lifted. This change in attitude towards dissection was due largely to the teachings of Plato and Aristotle on the soul. According to Galen, Herophilus of Chalcedon (c.335–c.280 BC) was the first to perform public dissections on human cadavers. He distinguished nerves, tendons, and blood vessels, and gave precise accounts of the retina, liver, pancreas and the genital organs of both sexes. Herophilus followed the Hippocratic method of balancing the four humours through drugs, diet, and exercise, and is believed to have been the first to measure the pulse, and use it to diagnose a fever.

Herophilus' rival at Alexandria, Erasistratus of Chios (c.304–c.250 BC), is known especially for his studies of the circulatory systems, including the nervous system, since he thought the nerves were hollow tubes filled with fluid. Erasistratus proposed mechanical explanations for many bodily processes, including digestion, and is often considered the founder of physiology. In the 1st century AD Celsus accused both Herophilus and Erasistratus of performing human vivisection, an accusation that was empathically repeated by Tertullian and St Augustine, but for which there is no evidence.

During the first centuries of the Christian era, many Greek physicians moved to Rome. Among them was Pedanius Dioscurides (fl. AD 20), a Greek pharmacist and author of *De Materia Medica*, which contained descriptions of about 600 plants with an explanation of their medical uses, and included many scientific illustrations to help identify them. Dioscurides greatly simplified the pharmacopoeia, and his work is the basis of modern pharmacology.

The first eminent Greek physician in Rome was Asclepiades of Bithynia (fl.150 BC), who opposed the humoral theory of medicine. Asclepiades drew upon the atomism of Democritus of Abdera (fl.420 BC), attributing disease to the contracted or relaxed condition of tiny solid particles he believed made up the body. This explanation became the basis of a school of medicine that extended until well into the 7th century. It largely disregarded the findings of anatomy and physiology

and concentrated on therapeutic massages, fresh air, and corrective diet. Soranus of Ephesus (2nd century AD), who followed Asclepiades' atomist approach, also came to Rome. Soranus wrote on childbirth, including the podalic (feet-first) delivery, infant care, women's diseases, and nervous disorders. An opponent of abortion, he devised several methods of contraception.

The most illustrious Greek physician in Rome was no doubt Galen of Pergamum (c.AD 130–201). Galen began his career at the Asclepius temple in Pergamum and came to Rome around AD 163. He was a brilliant and prolific writer with great rhetorical skills. About 300 titles are attributed to him, of which about half survive. They cover close on every aspect of the medical theory and practice in his day. For his own views he combined ideas from Plato and Aristotle with the Hippocratic tradition. Like the Hippocratic physicians, Galen believed that health required an equilibrium of the four humours, but unlike the holistic Hippocratics he argued that imbalances can also be confined to particular organs.

For Galen anatomy formed the basis of medical knowledge and he frequently dissected and experimented on animals. Notable are his vivisection experiments, such as tying off the ureters to show the functions of kidney and bladder. Because of a ban on human dissections, his anatomy was based largely on the dissection of mammals, which often led to errors. His description of the uterus, for instance, is largely that of a dog. Galen saw the body as three connected systems: the brain and nerves are responsible for sensation and thought; the heart and arteries are responsible for life-giving energy; and the liver and veins are responsible for nutrition and growth.

Although observation does play a role in Galen's system, his general tenet was to explain everything in pure theory, to which his rhetorical skills gave the air of being infallible. This led to a strong tendency to dogmatism among his followers. Galen's approach is in this respect almost the opposite of the Hippocratic method, which tried to remain close to the facts and proceeded through a careful description of case studies.

Megalopolis

City in Arcadia

Megalopolis – the ironically named “Great City” – was founded at the instigation of Epaminondas and the Boeotian federation after their shattering victory over the Spartans at the Battle of Leuctra in 371 BC and their subsequent incursion into the Peloponnese during the winter of 370/69, at the invitation of the Arcadian League.

During this incursion Epaminondas had stopped short of attacking the city of Sparta itself, even though it was unwalled, but he successfully removed one of the main supports of Spartan power, their possession of Messenia, reconstituting it as an independent state with a vastly fortified city at Messene. In the next year, 368, he followed this up with a second invasion of the Peloponnese. He used his successes this time to strengthen the Arcadian League. It was at some point during this that he organized the creation of Megalopolis (Pausanias says a few months after Leuctra, when Phrasicleides was archon at Athens, that is in 371/70 BC, but this is too early).

The new city served several purposes. It was situated in southern Arcadia, in an area of upland plain drained by the headwaters of the river Alpheus (which then flows westwards, past Olympia). This area also has access to the Eurotas valley to the southeast, and to Messenia and Mount Ithome to the southwest. It was thus strategically vital if the Spartans were to be restricted to their homeland of Laconia, and an anti-Spartan stronghold here was a crucial part of Epaminondas' new order for the Peloponnese. It was designed also to strengthen the unity of the Arcadian League, to create a formidable single power in the central Peloponnese which would in turn prevent any Spartan resurgence. Arcadia had come rather late to the formation of city-states, and this had made possible the formation of the federal league. Of the existing cities, Mantinea had been formed out of constituent villages, and broken up into villages by the Spartans in 385 BC. Tegea had existed as a recognizable city for centuries, but there was rivalry with the neighbouring Mantineans, who were unlikely to recognize it as the leading state in the Arcadian League. Megalopolis therefore

served as a new, artificial, neutral city which all the other Arcadians could recognize as their capital without loss of face. According to Pausanias (2nd century AD), it became the youngest city, not just in Arcadia, but in all Greece, excluding colonies founded by the Romans. He names the founders, probably on the basis of a record kept at Megalopolis itself, as Lycomedes and Hopleas from Mantinea, Timon and Proxenos from Tegea, Creolaos and Acriphios from Cleitor, Eucampidas and Hieronymus from Maenalos, and Possicrates and Theoxenos of Parrasia, that is, two from each of the main cities of Arcadia, thus emphasizing its position as a centre for all Arcadians. The actual population came from the existing villages in the vicinity. Pausanias gives a list of their names; he adds that some had to be coerced.

The remains of ancient Megalopolis are not well preserved, and virtually nothing of its surrounding city walls can be seen, though their line has been traced. They enclosed a large area, as at Messene, but from the start the city seems to have been designed for a substantial population, moved in from the villages, unlike Messene whose walls were intended to provide a place of refuge in emergency for Messenians living outside the city. The architectural importance of Megalopolis rests with the buildings constructed to enable it to function as the capital of the Arcadian League: a roofed hall for the council of the league, called the Thersilion after its founder, and the adjacent theatre which, quite apart from any use for the performance of drama, would also have been the seat of the 10,000-strong representative assembly of the league. The porticoed entrance to the Thersilion served as the stage building (*scaenae frons*) of the theatre. Both were excavated by the newly founded British School at Athens as its first major excavation in 1891. The theatre, one of the largest in Greece, was fairly well preserved (though earth tremors have caused subsequent damage). The Thersilion, however, had been reduced to its foundations, perhaps indicating a structure of mud brick; it was already in this state when Pausanias saw it. It was a rectangular building, 66 m wide, 52 m from front (the portico) to back; as with all ancient Greek enclosed buildings of this size its roof had to be supported on a forest of columns, but these were arranged as a series of lines radiating from an area between the centre and the main entrance of the building which was obviously the place from which speakers addressed the council, thus giving direct lines of vision to the speaker from the assembled councillors. Another important building originally excavated by the British School in 1891 (it is now being re-examined by a German archaeological team) was the principal portico building of the agora, the stoa of Philip, a huge Doric building, measuring 155 m in length, with projecting wings at either end. The

facade has no fewer than 86 Doric columns; the interior was divided into three aisles by double rows of Ionic columns, with two extra columns in each wing. Such a colossal building could only be the gift of a king; in this case Philip of Macedon, seeking to confirm the support of the Arcadians, and almost certainly Philip II, in the aftermath of Chaeronea and the refusal of the Spartans to join the Peace, rather than Philip V, reviving Megalopolis after it had been sacked by the Spartans under Cleomenes III in 223 BC.

In the Hellenistic period Megalopolis was a firm supporter of Macedon, notably in the 240s when it was ruled by a tyrant, Lydiades, probably installed with Macedonian assistance. Nevertheless, finding himself increasingly isolated he had joined the Achaean League; it was this that provoked Cleomenes' attack, the effect of which was reversed by the unexpected alliance of the Achaean League with Macedon and the defeat of Cleomenes at the battle of Sellasia in 222 BC. Thereafter Megalopolis continued as a member of the Achaean League, and so became embroiled against Rome in the Third Macedonian War, resulting in the son of its leading politician Lycortas being taken to Rome as a hostage. This was the historian Polybius, whose writings make him not only the greatest historian of the Hellenistic period, and of the involvement of Greece and Rome, but also by far the most eminent citizen of Megalopolis.

After the Roman incorporation of Greece as its province of Achaëa, Megalopolis continued without any political importance (and hence the ruin of the Thersilion) as a small provincial city. It faded away in later antiquity, the population dispersing once more into villages.

Megara

City in central Greece

Situated between Eleusis (19 km distant) and the isthmus of Corinth (33 km away), close to the north shore of the Saronic Gulf, the ancient city of Megara was topographically focused on the twin acropolises of Alcahous and Caria: the same is true of the modern town.

The ancient harbour, now silted up, was about 1.5 km away at Nisaea, opposite Salamis and to the west of modern Pachi, which is of no importance. On the west side of the site of the Nisaea harbour area is the hill of Palaikastro (later the site of a Frankish fort), which was probably ancient Minoa. Minoa is mentioned in ancient sources as either an island or a cape. To the east, the hill of Hagios Georgios has ancient fortifications and was probably the acropolis of Nisaea.

Although the small plain in which Megara itself lies is fertile and produces vines and olives, the hinterland is mostly mountainous and barren, dominated by the Yerani and Pateras ranges to the west and east respectively.

At its greatest extent the territory of Megara covered the whole of the peninsula between Eleusis and the isthmus, and included Aegosthena and Pagae to the north and east, and Perachora to the west. Pagae, near modern Alepochori, is close to the shore of the easternmost arm of the Corinthian Gulf (the so-called Halcyonic Gulf). Megara's ports thus gave access to two seas. Through its territory passed important land routes between Attica and the isthmus and between central Greece and the isthmus. The position of Megara on these strategic routes, although advantageous to trade and communications, was also the cause of misfortunes since armies ravaged the city in passing or brought it into conflicts through use as a base.

The settlements of Rous (to the north) and Tripodiskos (to the northwest, on Mount Yerani), and the sanctuary of Zeus Aphesios (above Kakia Skala) were also Megarian.

Only limited traces of Neolithic settlement have so far been found (at Lake Vouliagmeni, near Perachora). Finds of potsherds show that the acropolis area of Megara town (where there is also "Cyclopean" walling which may be prehistoric), as well as the probable sites of ancient Nisaea and Minoa, were inhabited in the Bronze Age. Myths suggest that in very early times Megara may have been subject to Athens.

But as a Dorian state it became important only from the 8th century BC. Its situation was favourable for trade and it was active in the colonial movement. Its foundations included Megara Hyblaea and Selinus in Sicily, and Chalcedon and Byzantium on the Bosporus.

Megara was ruled by tyrants for much of the Archaic period. The best known of them is Theagenes (mid-7th century), whose son-in-law Cylon attempted a coup at Athens.

Its territory was diminished in the 6th century when the Athenians, under Solon, took Salamis, and the Corinthians the western part of the peninsula. Megara took part in the Persian Wars.

In 461 the Athenians built the long walls connecting the city with

Nisaea and garrisoned both this harbour and that at Pagae. In 456 the Athenians withdrew when the Megarians rejoined the Peloponnesian side. This caused enormous resentment at Athens and resulted in the “Megarian decree” of 432 by which the city was banned from Athenian markets. The Athenians continued to harass the city, building the fort at Boudoron on Salamis to check Nisaea.

After the start of the Peloponnesian War, in which Megara suffered badly, partly because of its changing allegiance, its territory was invaded twice annually. For a time in 424 the Athenians took control of Nisaea and Minoa, but did not succeed in capturing Megara itself.

Recovering in the 4th century, the inhabitants rebuilt the long walls, again with Athenian help, as a defence against Philip of Macedon. In 315 the city was used by Cassander as a base against the Peloponnese. In 307 it was besieged by Demetrius Poliorcetes who took away all the slaves, thus devastating the economic infrastructure. In the 3rd-century “Chremonid” War (between Athens-Sparta and Macedon) Megara was controlled by the Macedonians, and later (243 BC) the city joined the Achaean League. Pagae and Aegosthena then became independent.

With its territory and power circumscribed, Megara was less important in the Hellenistic and Roman periods. The city suffered at the hands of Roman armies but remained rich in the buildings and works of art described by Pausanias.

Study of the town’s antiquities began in the 19th century with the work of H. Reinganum and has continued since. Megara’s most impressive surviving ancient monument is the so-called Fountain of Theagenes, ascribed to the tyrant. In fact this is a large reservoir, its roof supported by pillars, originally fed by an aqueduct.

Pausanias saw numerous public buildings and works of art. The sites of several of these have been identified by excavations or the discovery of inscriptions. Most of the public buildings either are no longer to be seen (a stoa of the agora, beneath the modern Plateia Metaxa) or have been incorporated in later buildings (inscriptions and a temple of Athena in churches, especially that of the Ypapandi, and houses on Alcathous). Numerous fragments of the fortifications (4th century BC) have been found, allowing the line of the circuit – and some of its gates – to be clearly defined. Megara was known for the quality of its houses, with capacious basements, many examples of which have been excavated.

Famous Megarians included the elegiac poet Theognis (7th or 6th century BC) and Eucleides, founder of the 4th century BC post-Socratic Megarian school of philosophy.

Melos

Island in the Cyclades

The geographical location of Melos, the most southwesterly of the Cyclades, gave it a position of considerable importance from earliest times, since it was the first of the Aegean islands that mariners would encounter after rounding the southern Peloponnese at Cape Malea on their way to the many ports of the Aegean. The island has an area of 147 sq km and like a number of other Aegean islands, has volcanic origins, and it is consequently rich in a variety of minerals; the export of these, which include alum, sulphur, keolin, and many others, provided a continuing source of wealth for its inhabitants. The use of millstones produced in Melos was also widespread throughout the Hellenic world. The crater of the volcano that formed the island provides one of the deepest and best protected harbours in the Aegean. The terrain of Melos is abundant in crops, although its hilly interior has been much mined for its mineral wealth; the highest of its mountains, Prophetis Elias towards the southwest of the island, rises to 751 m.

During the 2nd millennium BC the island formed part of the Cretan and Mycenaean kingdoms, and was later settled by Dorians from Laconia. The Melians provided two penteconters for the Athenians at Salamis (Herodotus, 8. 48), but during the Peloponnesian War they antagonized the Athenians, who mounted a successful siege of the

main city, later killing or enslaving the entire population. Thucydides (8. 85–110) provided a record of the dialogue that preceded, and was the ultimate cause of, this event.

Men

Hellenic woman is as ubiquitous as Hellenic man, yet across the centuries it is man who has held centre stage in the public domain, and he has consequently more often than his counterpart given rise to civilizations and genealogies, eternal ideas, innovative art, has waged wars, and has been the celebrated object and subject of intimate love and fraternity. While woman is the pillar of domestic life, muse, backstage conspirator, it is man who wears the laurels, wields the sword, runs the races, and heralds the dawn of every great triumph. If Zeus and patrilinealism are to the Greek imagination what Isis and matrilinealism are to the Egyptian, it is the gods who have made it so. Yet human agency has perpetuated the myth.

The patrimony of three thousand years of Hellenic culture is threaded together by a clear distinction between private and public life. With notable exceptions, women determine the former, and men are left with the latter. Family farms and homesteads during the Ottoman empire encouraged these distinctions, as does modern agricultural life, where men are associated with labour and tilling the fields and women with kneading the bread and keeping house, with equal feats of endurance. In some communities, women till as much as they knead. But when women do take centre stage, their dignity is unsurpassable and memorable, for such public presence is culturally unseemly, yet the odds against these occurrences, once great, lessen with each passing decade. In recent years women have gained ever greater entrée into politics, the arts, and higher-degree professions. By and large, men and women are proceeding into the new millennium arm-in-arm. But it is the men in the drama of the Greek experience, ever at the proscenium, we now recollect.

The task of making generalizations about men in the Hellenic world is a formidable one. To circumscribe them in a homogeneous mould

would do more damage that it would offer insights, and stereotypes are inevitable. Like any other citizen of the world, the Hellene is complex, enigmatic, and multifarious, yet artistic representation, history, and social constructions do offer some clues. Though the main ports and remote outposts of manhood may be miles apart, we shall try to survey the topography none the less. If there are overarching themes of manhood, manliness, or masculinity within Hellenism, for the most part they are culturally determined.

Yet, reinvent themselves they do, as the romantic hero, the premodern entrepreneur, modern stay-at-home husband, or postmodern poet, one commonality rings true across class, station, and political ideology – most Greek men value their masculinity, which embodies a sextet of attributes: endurance, duty, freedom, love of beauty, passion for knowledge, and love of life. Some value schooling more than others, yet even those with an elementary education will quote Marx, will tell you whence the wind blows in December, will discourse knowledgeably on world politics. Classicism, with or without its nuances, indubitably makes itself known somewhere in the Greek man's mind and sticks. And because of this renowned heritage, real or imagined, a certain amount of braggadocio enters the picture, and for this an audience must be found. Conversation, thus, is the *sine qua non* of his existence. Without community, comrades, or friends, life's purpose would evade him. An Epicurean fragment: "Remove sight, association, and contact, and the passion of love is at an end."

Men of the Hellenic world communicate not only through speech, but with the eyes and hands. The eyes, possessing inner or outer vision, are the proverbial windows to the soul, and they matter. With radial lines at the outer fringes, knowing much laughter, weathered with experience, they speak volumes. The hands – dirtied by work, the pristine hands of the politician, hands stained by cigarettes, veined, long-nailed, delicate, or strong – greet in kindred manner: firmly. In countenance and comportment variety is the norm. All types factor into the mix – bearded like Dionysus, fresh as Adonis, spectacled, stout, towering, cologned, flat-nosed, cultured, blond, blue-eyed, coffee-skinned, dark, fair, the curly-headed ones, rogue, family man, marauder, pious one, tempestuous, tender. Yet, what matters is truth, not oblivion, and this is conveyed through a steady gaze, universally.

With the birth of Archaic Greek sculptural arts, one witnesses the most lasting memorial to the Hellenic male figure, inherited from the civilization across the sea in Egypt, in the form of the free-standing *kouros*. Strong-limbed and planar in construction, the *kouros* gazes straight ahead and smirks, while one foot steps forward into what will be a continuous unshakeable history, a testimony to his fortitude. Lacking the ease of hip and *contrapposto* fluidity of his later

metamorphosis, the static *kouros*-as-museum-piece is very much alive in spirit in contemporary Greece and its diasporas. What it represents is more than an idea. It is an ideal, a perpetual reminder of proportional harmony and stability, against which man measures all things.

What of the world of the homoerotic, the stereotypical love figure adorning those vases one sees in museums in western capitals? Not just a question of sexuality, but a question of beauty. The Alexandrian poet Constantine Cavafy captured the cultural convergences as well as the lure of the sensual in “Of the Jews (AD 50)”:

Painter and poet, runner, discus-thrower,
beautiful as Endymion: Ianthis, son of Antony.
From a family on close terms with the Synagogue.

“My most valuable days are those
when I give up the pursuit of sensuous beauty,
when I desert the elegant and severe cult of Hellenism,
with its over-riding devotion
to perfectly shaped, corruptible white limbs,
and become the man I would want to remain forever: son of the
Jews, the holy Jews.”

A most fervent declaration on his part: “... to remain
forever
a son of the Jews, the holy Jews.”

But he didn’t remain anything of the kind.
The Hedonism and Art of Alexandria
kept him as their dedicated son.

Where social relations in ancient Greece delineated sharply between men’s work and leisure in the social realm and women’s work or play in the private (despite the heady and sporadic appearances of an Aspasia or a Sappho), fraternal and erotic love objects were legendarily men. As much as wives bore the children and stood by their men, the rules governing apprenticeships in philosophy or the arts or the nascent sciences occasionally transcended into elite homoerotic patronages. The elder courting the younger, the younger of perfect body and shapable mind, the elder of knowledge and experience. Plato’s idealized Republic made some things clear: the guardians of the city were to be honed and shaped internally and externally. Mathematics, astronomy, musical training, sporting activity, made for the consummate citizen. An advocate of some kind of communism, inclusive of women, sharing the labour and expenditures of a variety of energies in the service of the city, with a wink and a nod in retrospect, one understands none the less the privileged place of men in that structured, hierarchical city.

The Epicureans, however, advanced Plato's invention, acknowledging for the fraternal brotherhood nature's – not god's – roll of the dice. Perambulating through the ether of the planned cosmos are the primordia, first beginnings, random chaotic particles, sensed but not apprehended. How beautiful an idea, random collisions of primordia, just like men, suddenly finding themselves together in commune, eating, drinking, and discussing. In this randomized cosmos, without divine intervention or teleology, how should man live his life? Epicurus' answer: seek pleasure and avoid pain, with temperance. A higher regression from the model city, these Epicurean communards disposed of Aristotle's legendary dictum and lived their lives not solely as political animals but as friends, eschewing public obligations though recognizing the mutual exercise of justice.

The honour-bound heroes of the Trojan War, of conflicts with Sparta, of Alexander's armies, of wars for independence, or wars against fascists, one part reluctant, one part fate-tempting, are long-lasting images of the Hellenic and Hellenic worlds and the Greek nation state. "Dearest, your own great strength will be your death", admonished Homer's Andromache, the loving, white-armed wife of Hector, tragic hero of the Trojan camp, breaker of horses. "Hector, you are father to me, and my honoured mother, you are my brother, and you it is who are my young husband", continued the pre-death eulogy of Andromache, whose name means, "she who fights like a man". To which the adoring husband replied, in Pope's verse:

"Andromache! my soul's far better part,
Why with untimely sorrows heaves thy heart?
No hostile hand can antedate my doom,
Till fate condemns me to the silent tomb."

No man is immortal, not even the hero Achilles, who was dipped into the river Styx for protection against fate, though it was his heel, where he was held, that was to be his downfall. With heroism comes human frailty, not decadent protection. For Homer, man was man, as was the great Alexander of Macedon. Plutarch's character study of him recalls his precocious and determined childhood, his competence, like Hector, to tame a wild horse with gentleness, "a confident voice, and a touch of the heel". Philip, noting his prodigal son's aptitudes, advised, "my son, look for a kingdom equal to yourself, for Macedonia has not space for you." The discontented pioneer, his soldiers haggard, traversed the continents establishing his own outposts of Hellenism, hybridizing his own tribes with those of the east, erstwhile barbarians. Both benevolent and vindictive, Alexander met his death not far from his bath, exhausted. Of these magnificent exploits "the end is always small", wrote the poet Yiorgos Chouliaras.

Homer's high heroic verse resounds archetypically, but from the lyric poets of the 7th and 6th centuries BC to the modern idiomatic poets, poetic subjects remind one of the timelessness of which we are a part. Bawdy like the rest of us, they are cynical reverent, awesome. This gem from the Byzantine period, a caveat against a careless appearance: "Tall and wavy are the crops/on your hairy face./ Scissors?/Never./Throw them away and bring out a plough." Michael Herzfeld's assessment of 20th-century Glendiots is fitting, where he writes "there is less focus of 'being a good man' than on 'being good at being a man' – a stance that stresses *performative excellence*." Socially, men do this best in the *kafeneia*, or coffee shops, of the modern day, gesticulating and talking their way to bravadoes.

Ever reveried, again enduring, still politicking, leaving home to find it elsewhere among their own kind, driving taxis, serving tasty morsels, crafting memorials of words and steel, airborne and stubborn, naughtily and forgivingly they persevere and clamour at the gates of hell and paradise. "Try to enjoy the great festival of life with other men", said the Greek Epictetus, enslaved to a Roman master.

Menander 342–292 BC

Comic playwright

Not only was Menander, in the opinion of his Hellenistic followers as well as of modern critics, the greatest playwright of New Comedy, but he is also among the most influential authors in the history of literature. In him the modern attitudes to quotidian existence, human character, life's vicissitudes, and society's conventions were first crystallized. Unconcerned in his works with Sophocles' tragic confrontations with time and the cosmos (though his subtle diction refers often to tragedy), he shows us as we are, with tolerance, affection, and a wisely critical eye. Subsequent writers of drama, when not tragic, usually took his approach for a model, from Shakespeare to Molière to Oscar Wilde.

Menander (or Menandros) was born in Athens of a good family at the end of the Classical period. Among his teachers was Theophrastus, whose *Characters* was surely an influence; Theophrastus' teacher was another realist, Aristotle, and Aristotle, of course, was Plato's student. In 338 BC Philip of Macedon made the Greeks his subjects, and Athens, after a last burst of heroic resistance under Demosthenes, began its slide from Hellas's most energetic city to a provincial town living on its reputation.

Menander's first play, *Orge* (Rage), was produced in 321 BC, and he died, supposedly drowned in the harbour of Piraeus, in 292 BC, a generation after the immense changes in Athenian society wrought by the conquests of Philip's son, Alexander the Great. His work anticipates and then reflects that later world, when men had lost belief in heroism and trust in public religion, and found fulfilment more as private individuals than as active members of the polis. That explains why Menander's plays do not resemble those of the 5th-century BC master of Old Comedy, Aristophanes, but rather the strange late romances of Euripides (who in old age forsook Athens for Macedonia); in plays such as *Alcestis* and *Ion* that disillusioned master abandoned ideals of high morality and noble citizenship and the tragic conception with them. In the satirical fantasies of Aristophanes the main character is the chorus, which represents the polis, i.e. us, the *demos*, while in Menander the chorus, left to the care of producers, merely provides entr'acte entertainment. Because Menander's plays do not comment directly on political life, they were international. The inheritor of the whole classical age, Menander helped to define the lesser but still brilliant Hellenistic age for his viewers and for us. Our notion of comedy is his.

Meaning, Menander thought, now that freedom and glory are gone, must needs be sought in the paradoxes of private life, at home and on the street. His characters are types – the curmudgeonly father, the wronged wife, the clever slave, the sweet-souled courtesan – and his plots, with their coincidences, mistaken identities, belated recognition

of foundling children, and acceptance of young lovers by parents, became so. Elements of them can be found hundreds of years later in the Greek romance “novels”. His time is contemporary and his location often Athens or Attica. But these provide a framework for the lifelike and sympathetic exploration of the problems of everyday happenstance. Although there is always a love interest, his themes are various and lead to reconciliation in the family and with neighbours. Stylized romantic plots expose society’s humdrum insecurities. The long modulated speeches so attractive to skilled actors in masks, the theatrical effects of surprise, the rapid dialogue in which one easy phrase may contain several meanings, the aphoristic wit, the moving direct appeals to the audience – the more we recover of him, the more diverse and profound he seems. His characters are rich, poor; old, young; male, female; free, slave; sophisticated, rustic; his range, so far as we can judge from the 5 per cent of his work that we know, is Shakespearean. (Hamlet’s remark, “Conscience doth make cowards of us all”, is taken from fragment 632.) His people quarrel, love, go to court, lend and borrow, yearn for riches and romance, get drunk, try to be good. His sympathy with slaves, for example, is almost unprecedented; in *The Farmer* he even shows a slave in love. His convincing understanding of human character, his colloquial and graceful language (mostly in iambic trimeter), and his sheer skill as a constructor of entertaining plays keep his work fresh and illuminating. He never moralizes, but he quietly puts forward ideals of tolerance, generosity, kindness, and understanding. In other words, he is typically Greek in that he seeks *dike*, or justice – but in ordinary life, with forgiveness always the resolution.

Menander’s immense skill is clearly evident in the early *Dyscolus* (The Curmudgeon), in the character of the gruff grouch Knemon, while the subtle clash and contrast of character and ethical principle in such plays as *Perikeiromene* (The Rape of the Lock), and *Adelphoe II* (Second Brothers), constitute his greatest achievement.

The works of most ancient writers have come down to us in tatters, and Menander, the last great poet of Athens, is no exception. Although he wrote more than one hundred comedies, only the *Dyscolus* (it won the prize in 317 BC) survives nearly intact; half a dozen plays are tantalizingly incomplete but sufficient for literary judgement, and a sheaf of fragments completes our knowledge. The longer pieces were discovered on Egyptian papyrus strips only in the 20th century. The comedies of Plautus and Terence, who flourished a century after Menander, are often either a close adaptation or even translation of Menander or other New Comedy playwrights, so that Roman drama could hardly have existed without his example. Before the recent discoveries, most of his immense influence derived from them; now at

least we have originals.

Menander's reputation, like that of Euripides, grew steadily after his death. Although he won only eight first prizes during his life, his plays became the basis of the comic repertoire. Because of this international popularity, he contributed to the fixing of the koine, or standard Attic Greek, that was the east's language of culture for hundreds of years. Byzantine students down to at least AD 600 and probably much later learned many of his sententious aphorisms, although in context (which was vanishing) these gnomes are always dramatic and often ironic. Now that Aristophanes, without his polis, was incomprehensible, comedy for a Greek, and indeed for us, meant Menander.

A few fragments have yet to be translated, and it is not unlikely that more will come to light. In our age of fragile relationships and moral confusion, we need them.

Biography

Born in Athens in 342 BC, Menander was a pupil of Theophrastus and a friend of Epicurus and Demetrius of Phalerum. As the author of over a hundred plays, he was and still is held to be the greatest playwright of New Comedy. His plays were popular in antiquity (he won eight first prizes) and were translated into Latin by Plautus and Terence. He died in 292, apparently by drowning in the sea off Piraeus.

Messene

City in the southern Peloponnese

Ancient Messene, located in the very centre of the modern province of Messenia, was one of the best-fortified cities of ancient Greece. Situated at the foot of Mount Ithome, it was protected by an acropolis. The city was named after Messene, the mythological first queen of Messenia, but it is not clear when it was founded. It is generally thought that the Theban leader Epaminondas founded Messene in 369 ^{BC}, after the battle of Leuktra. But Plato (*Laws*, 683 d) and Isocrates (*Arch.*, 22), among other 4th-century ^{BC} authors, allude to the existence of the polis of Messene long before that date. Only later sources, such as Strabo (8. 58) and Pausanias (4. 1. 3–4), attribute the foundation of Messene to Epaminondas. Pausanias does however mention an earlier city on that spot, but refers to it as Ithome (4. 9. 2).

From 371 ^{BC} the Thebans diminished Sparta's power by uniting the peloponnesian people in strong cities. Argos and Mantinea were fortified. The Arcadian League was formed with its newly built capital at Megalopolis. The independence of Messenia was to be guaranteed by constructing the walled city of Messene. In 369 Epaminondas sent envoys to southern Italy and Libya to invite the Messenians of the diaspora to return to their homeland. Many of them did so and thus they populated the city.

Messene was built in a short time, by the joint efforts of Thebans, Arcadians, Argives, and Messenians, who together laid out streets and built houses, temples and circuit walls. At the same time Epaminondas built a harbour for the Messenians, at Kyparissia on the west coast. Pherae (Kalamata) would have been more suitable as a harbour, but there the Spartan threat would always have been near. Epaminondas' master plan succeeded, and Sparta's power was restricted between the Taygetus and Parnon mountains.

When Philip II of Macedon led his troops against the Greek city

states, the Messenians formed an alliance with him. They did not take part in the Battle of Chaeronea (338 BC), because they refused to bear arms against fellow Greeks. After Alexander the Great's death (323 BC), however, the Messenians joined the Greek revolt and thus lost their friendship with the Macedonians. In 213 BC Philip V visited the citadel of Messene with his counsellors Aratus of Sicyon and Demetrius of Pharos, under the pretext of making an offering to Zeus. He was in fact planning to capture this attractive bastion and after making the offering he asked his counsellors for advice. Demetrius warned him that if he did not take the citadel, he perhaps would be sorry afterwards. "Remember that it is only by holding both his horns that you can keep the ox down" (Polybius, 7. 12). The horns referred to the bastions of Mount Ithome and the Acrocorinth, and the ox to the Peloponnese. Aratus advised Philip to withdraw, and thus avoid arousing the hostility of the other Greek states. Philip took Aratus' advice, but soon afterwards regretted it. The same year Aratus died, presumably poisoned by Philip. A year later Demetrius of Pharos tried to capture Messene by a surprise attack, but the inhabitants resisted fiercely and defeated the Macedonian troops. Demetrius was killed in battle.

Messene was finally captured by Nabis, the tyrant of Sparta, in 195 BC. He abandoned the city after a short time, due to the threat of an attack by the Achaean League. In 191 BC Messene was forced by the Romans to join the Achaean League and in 146 BC, like all Greek cities, it became part of the Roman empire. Hostility with Sparta continued to play an important role in foreign policy. As the Spartans favoured Octavian (later Augustus) in his struggle for power, Messene was forced to choose Mark Antony's side. After the battle of Actium in 31 BC Messene lost control of the cities in the Mani.

The city of Messene flourished until the end of Roman control over Greece. It remained the capital of the free Messenian state until the 4th century AD. In AD 395 the Goths destroyed and depopulated the city, which was never to be inhabited again. The village of Mavromati, between the ancient city and Mount Ithome, is a recent settlement.

On top of Mount Ithome stand the remains of the sanctuary of Zeus Ithomatas. It was there that Philip V of Macedon was tempted to seize the city. On the way down one crosses the remains of a temple. This might be the temple of Artemis Laphria, mentioned by Pausanias (4. 31. 7). However, an inscription found at the spot refers to Artemis Limnatis. Other public buildings revealed by archaeologists are a theatre and a stadium. The most striking feature of the city is the vast Asclepieum. The temple of Asclepius and his daughter Hygieia is surrounded by smaller temples of unknown use, a bouleuterion, an odeum, and, of course, baths. The Sebasteum to the north of the

temple proves that the city flourished in Roman imperial times. The worship of Asclepius in Messene is also evidenced by the fountain in the centre of the city, assigned to Arsinoe, in Messenian mythology the mother of Asclepius.

The walls of Messene are as imposing to the modern visitor as they were to the ancients. Pausanias (4. 31. 5) was impressed by their construction and considered them stronger than those of Byzantium and Rhodes. The 10-km circuit connects the city with the acropolis on Mount Ithome. Two city gates are well preserved: the Laconian Gate on the saddle between Mount Ithome and Mount Eva and the impressive Arcadian Gate on the western side of the city. The wall is best preserved in this western section with its round and square two-storey towers occurring at intervals; it makes the site one of the most interesting example of 4th-century BC architecture.

Messenia

Region of the Peloponnese

Messenia is one of the seven provinces of the Peloponnese. It covers the southwestern part of the peninsula. Like most Greek provinces its boundaries are formed by sea and mountains. The eastern approach is blocked by the inhospitable Taygetus ridge, which offers passage only far down in the Mani or through the Langada pass. To the north, Messenia ends halfway across the Tetrazion mountains. Here also access is only possible through narrow passes from the plain of Megalopolis and along the coast.

The province includes the fertile Messenian plain, which leads to the Messenian Gulf, and a narrow, more or less flat, coastal area to the west. These plains are divided from the north to the southernmost point by the Aigalion ridge, of which St Barbara is the most conspicuous peak (1112 m). Kalamata is the provincial capital and with its 44,000 inhabitants by far the largest city. Other local centres are Pylos (2000 inhabitants) and Kyparissia (4500 inhabitants).

According to Pausanias (4. 1. 1–2), Messenia owes its name to its first queen, Messene. She was married to Polycaon, the younger brother of the Laconian king. She was also the daughter of the king of

Argos, and therefore too proud to be satisfied with her husband's minor role in Laconia. She took Polycaon and his retinue from Argos and Sparta and crossed the Taygetus mountains. This land from then on was called Messene. Many generations later, Messenia passed to the Neleid dynasty. Neleus and his son Nestor lived in prosperity in their palace at Pylos. Nestor took 90 ships to the Trojan War, which suggests he was the second most powerful ruler, surpassed only by Agamemnon. Nestor's wealth must have been based on the agricultural resources of the Messenian plain. The Linear B tablets, found in the Mycenaean "Palace of Nestor" near the modern village of Pylos, confirm this picture. The ruler of the palace subjected the population of Messenia to a strict taxation system. The range and quantity of products were vast: wine, honey, wheat, barley, olives, figs, spices, pigs, horses, sheep, goats, etc.

After the Dorian invasion of the Peloponnese Messenia was assigned to Cresphontes. Much more violent were the Spartan invasions of the country, better known as the Messenian Wars. During the Archaic period, when other city states solved their overpopulation problems by setting up colonies, Sparta conquered Messenia and subdued its population. Much is written, but little is known about these wars. Pausanias gives a detailed report, but he undertook his travels in Roman imperial times. Therefore our knowledge of dates and facts is far from accurate. In the second half of the 8th century BC the Spartans for the first time crossed Mount Taygetus and attacked the Messenian plain. For 20 years the Messenians fought back, first under the inspiring leadership of their king Euphaes, a descendant of Cresphontes, and after his death under Aristodemus. Finally, however, the Spartan Ithome. The Messenians kept their autonomy by paying the Spartans half of the produce of their land. After a rebellion in the second half of the 7th century many Messenians emigrated to Rhegium in southern Italy, where, in 493 BC, their descendants captured Zancle and renamed it Messana (now Messina). The remaining inhabitants were reduced to serfdom. The Third Messenian War (500–489 BC) may have kept the Spartans away from the battlefield of Marathon in 490 BC. The Fourth Messenian War (464–459 BC) was a Pyrrhic victory for the Spartans. Although Messenia was once again brought under Spartan dominion, exiled Messenians were settled by Athens in Naupactus. It was these Messenians who in 425 BC supported the Athenians at the siege of Sphacteria and thus put an end to Sparta's reputation for invincibility. After the Peloponnesian War the Messenians were driven from Naupactus by the Spartans and again went in exile to southern Italy and to Euthesperides in Libya (later Berenice). Finally, after the Battle of Leuctra (371 BC), where the Spartan army was defeated by Theban forces, Epaminondas

repatriated the Messenians from the diaspora and built (or refortified) for them the strong city of Messene at the foot of Mount Ithome. He also rebuilt Kyparissia, to be used as the port and harbour of Messene. Sparta never regained control of this area and Messenia remained independent until the Roman conquest of Greece in 146 BC.

Information about Messenia under Roman rule is very scarce. The country seems to have had a certain kind of autonomy, but being a part first of the province of Macedonia, and after 31 BC of Achaëa, Roman authority was never far away. Emperor Augustus gave the cities of the Mani to Sparta; Tiberius assigned the cities on the western flank of the Taygetus mountains to Messenia.

The barbarian raids of the 4th century AD mark the end of antiquity. Alaric and his Visigoths invaded Greece and sacked the major cities and sanctuaries. In AD 395 the city of Messene was destroyed and depopulated. It does not appear to have been reinhabited in the medieval period. During the 7th and 8th centuries AD Slavs settled in Messenia. Medieval city names such as Sitsova, Tsernitsa, and Gialova are proof of this immigration. Byzantine families built fortresses over ancient foundations in Kyparissia and Kalamata.

Metalwork

A knowledge of the processing of metals came to the Greek world in the Early Bronze Age (3000–2000 BC), in all probability from the east. The finding and working of copper and iron are attributed by such authors as Dioscurides, Strabo, Pliny, and Diodorus Siculus to the mythical demons, the Cabiri (Phrygian) and Curetes (Cretan).

In Homer we have the earliest description of the way in which a coppersmith's shop operated; the coppersmith is Hephaestus, god of fire, himself a deity who came from the island of Lemnos in the Aegean. The first examples of the copper-smith's art were found in the Cyclades – the Zia cave on Naxos, Kefala on Kea – at Knossos in Crete, at Yali in the Dodecanese, and in Cyprus. The on-the-spot processing of the metal copper and its alloy bronze required collective action, the

pre-existence of deposits, and organized trade. We possess no more than 100 metal objects from Neolithic Greece.

In the Early and Middle Bronze Age (3000–1450 BC) metal vessels imported from the Near East seem to have affected the shapes of ceramics in Thessaly (Dimini, phase 1), although there is early evidence for the morphological independence of metal objects in the Greek world. There is a silver *skyphos* (cup, can) from Amorgos in the Cyclades, another *skyphos*, and two gold vessels of primitive shape in the Benaki Museum in Athens. Gold *kymbes* (cups) and elliptical *skyphoi* with a spout seem to have served as drinking cups – such as the one found at the Heraea of Arcadia (in the Louvre), which has been shaped by hammering from a single leaf of gold, apart from the handle. These show that the inhabitants of mainland Greece also made vessels from precious metals.

In Crete silver objects from the early Minoan period have been discovered on the islet of Mochlos. One cup, with a handle, was full of gold jewellery. In the Minoan palace period (Knossos, Mallia, Phaestus) a brilliant civilization, considered to be Europe's first, developed; it dominated the whole of the Aegean and had constant contacts with the east and with Egypt. At the beginning of the 2nd millennium BC metalwork and metal vessels developed to the point where they became models; their shapes were copied and their grooved and chased naturalistic decoration appeared in paint on ceramic vessels. The horde discovered at Tôd in Egypt (tomb of Amenemhet, 1940–1938 BC), consisting of 153 silver cups and only one in gold, is in all probability from Crete. There were deposits of silver on certain of the Cyclades, at Akrotiri on Thera, and in the Laurium region in Attica, all workable before 1600 BC.

The commonest type of vessel made of gold or silver in Crete seems to have been the drinking cup. The gold cup with relief decoration consisting of spirals and rosettes from the so-called Aegina Treasure in the British Museum must also be Cretan. Objects made by the “Kaptaru” (Cretans) were, according to texts from Mari in the mid-Euphrates, much sought after. Small scale carving (seal carving) and the art of metalwork reached their highest point during the “New Palace” period, which produced superb chased ritual swords with inlaid gold, decorative gold double axes – symbols of the Minoan religion (votive offerings from the sacred cave of Arkalochori, of 1600 BC, in the Herakleion Museum), figurines, chased or cast, relief or engraved vessels, inlaid with sacred bulls' heads, and bronze *lebetes* (cauldrons) to hold a whole sheep for boiling. The handles of cups and the upper part of closed vessels such as *prochoi* (jugs) and *hydriai* (water jugs) were made from separate pieces of metal; although it seems that the craftsmen of the Aegean area knew the art of soldering,

they nevertheless preferred to join the parts by riveting.

The eruption of the volcano of Thera (Santorini) around 1500 BC swept away the peaceful matriarchal and refined Minoan civilization which was succeeded by the equally brilliant Mycenaean civilization of mainland Greece. Large centres of Mycenaean culture have been identified at Mycenae, Tiryns, Pylos, Athens, Thebes, Orchomenus, and Iolcus. The best-known branch of art in the early part of the Mycenaean period, influenced by the Minoans, is metalwork, as is illustrated by the wealth of vessels, tools, and jewellery found in the royal tombs, reminiscent of the high standard of living; figurines are comparatively few. Purely Mycenaean metalwork makes its appearance in the many bronze household utensils – in all their different forms with engraved or relief ornamentation – that were handed down from generation to generation as heirlooms or dowries (the Dendra tombs, the hearth with the tripod at Knossos, Perati in Attica, Curium in Cyprus). The fine gold cups from a tomb at Vapheio (Sparta), for example, show the capture of wild bulls (Athens Archaeological Museum). Also striking are the huge bronze figure-of-eight shields and gold engraved seals, the swords decorated with inlaid gold and niello (a blue-black alloy of copper and silver with sulphur), and the gold masks made to adorn the faces of dead kings and notables, with their imposing features, such as that once thought to be Agamemnon's with its engraved moustache and beard.

The Panhellenic campaign of the Achaeans against Troy is an indisputable historical event. A dramatic scene from a siege is shown on the famous "siege *rhyton*" (drinking horn) from the acropolis of Mycenae, grave IV (Athens Archaeological Museum). At the time of the campaign against Troy and in the early 12th century BC that followed, there was a distinct decline in the arts throughout the Aegean, coinciding with the destruction of the centres of Mycenaean civilization for reasons that are unknown to us. Nevertheless, there was a significant change in the technology of metals, bronze being replaced by iron for tools and weapons, though metal objects were rare. In the 11th century BC the early Geometric style marked the beginning of a long process leading in the end of the achievements of Archaic and Classical Greece.

The establishment of Greek colonies, from the Pillars of Hercules, Italy, Sicily, the Crimea, and Asia Minor to Phoenicia, brought a lively trade with the Near East, which gave a new boost to the demand for and working in metals. The development of metalworking from the early 8th century BC onwards was impressive. All the metal figurines (of copper or bronze), male and female, are shown nude. The females convey a sense of immobility, with their arms held down the sides of the body, while the male figurines, which form the overwhelming

majority down to the 8th century BC, are shown with their hands raised in an attitude of worship, as in the case of the male figurines from Gazi and from Karfi in Crete. In the Geometric period the stylized depiction in figurines of animals such as the lion and a great number of bronze colts from workshops at Argos, Olympia, Corinth, and Laconia made its appearance.

Around 725 BC bronze figurines from Attica take a more naturalistic and less stylized form. The beginnings of the depiction of organic details (clavicles, chest muscles, indication of the locks of hair) can be seen in the figure of a warrior wearing a helmet, from the Acropolis.

Before the end of the Archaic period, scenes from everyday life made their appearance in metalworking, together with figures such as a drinker or flute-player from Sparta or Olympia, a lyre player from Herakleion in Crete, an archer from Delphi, and a number of compositions in bronze, such as charioteers on their chariots, the most important example being the well-known *Charioteer of Delphi*. In historical times iron, and a knowledge of how to work in it, prevailed over bronze throughout the Greek world, without the use of bronze going completely into abeyance. Nevertheless, since iron rusts and breaks up, only a very few examples have survived, such as a gilded iron ring in the Athens Archaeological Museum. One of the regions richest in copper ores was Cyprus – hence the Latin *cuprum*. Homer knew of the copper of Tamassos in Cyprus, which he mentions in the *Odyssey*.

It was from Cyprus, from around the middle of the 2nd millennium BC, that a standardized mass of pure copper in the shape of a pillow, weighing one talent, went to many parts of the ancient world as raw material. Sardinia and southern Spain (Tartessus) were also important sources of copper. The origins of the tin that was necessary for the hardening of the prehistoric alloys remain obscure – perhaps it came from Afghanistan – but in historical times we know that the tin used was derived from the Tin Islands (Cassiterides) – Britain – and that it reached the Mediterranean via the Iberian peninsula and Gaul. Lead may also have been used for the hardening of the alloy. This was to be found in large quantities in Greece, for example, in the mines of Laurium, as a by-product of the production of silver (tin was totally absent).

The two principal methods of making bronze objects (figurines of animals or human beings, tripods, jewellery) in early antiquity, and throughout the centuries down to the present, were the casting of the molten alloy in a suitably prepared mould (such as, for example, the plaster moulds of the late 10th century BC from Lefkandi on Euboea for the making of tripod feet), and beating it out with a hammer. The best bronze sheeting had a 5–10 per cent admixture of tin. An increase of

the tin content rendered it fragile, but gave it a superb yellowish colour like gold, as is demonstrated by the famous Derveni *krater* (mixing bowl) of Hellenistic times, whose metal has a 15 per cent tin content. The chasing technique was used extensively in the 8th and 7th centuries BC for the production of statues of medium size. Famous works of chasing are the *Divine Triad* of the 8th century BC from Dreros, Crete, of a height of 0.80 m, nailed to a wooden core (Herakleion Archaeological Museum), and the silver bull from Delphi of the 5th century BC. In the case of larger cast statues, for reasons of economy of the metal, from the mid-seventh century BC the technique known as the “lost wax” method was devised.

From the 5th century, meanwhile, a new technique of “indirect” casting came to be used whereby a clay model was made and a mould (“negative”) was produced from this, making it possible to have a large number of identical cast objects. The details, such as the hair, the eyes, and the nails, were incised with a sharp instrument. Often the pupils of the eyes were of inlaid ivory, and the nipples and lips of plain inlaid bronze.

The success of the Athenians and their allies against the Persians (490–479 BC) led to the splendours of the age of Pericles and of Classical Greece with its humanistic philosophical systems and its universally admired art. The Chalkotheke, the building next to the Parthenon on the Acropolis of Athens, housed the metal votive offerings to the goddess Athena – some of bronze, but chiefly of precious metals.

The Spartan Telestas, of the 6th century BC, and the great Myron, of the 5th century BC, belong to the same category of craftsmen: they were at one and the same time workers in bronze and silversmiths. Myron is credited with the making of silver drinking cups, while the great sculptor Phidias himself produced the parts in silver of the chryselephantine Zeus, as can be seen from the earthenware moulds found in his workshop at Olympia.

Herodotus tells us that Corinth was an important centre of working in bronze. In Classical times, gold and silver vessels, chiefly *hydriai*, were made in southern Greece, as can be seen from the catalogues of the Chalkotheke on the Acropolis, but not a single one has survived. In the 4th century BC, bronze figurines and *hydriai* for funerary purposes ceased to be made at Athens, while *hydriai* and receptacles for ashes continued to be produced in gold and silver. In Magna Graecia, Tarentum was an important centre for repoussé metalwork. Silver folding mirrors with scenes in relief and silver vessels with gilt details, now in the Metropolitan Museum of Art in New York, have been found in tombs.

Modern archaeological research has demonstrated that the

inhabitants of central Macedonia (Sindos) in the 6th century BC, and those of Acanthus in Chalcidice (a colony of the island of Andros), were silversmiths of exceptional skill, producing silver cups, kraters, etc. (Herodotus, 7. 119). The silver mines of Siphnos and Lesbos, and later those of Laurium in Attica, have provided us with valuable information on the advanced technology in this field.

The biggest centre for such work in Hellenistic times was Alexandria, and a striking description of the city of Ptolemy II Philadelphus (271 BC) is given by Athenaeus in his *Deipnosophistai* (5. 196a–203b). The city's luxury and wealth were fabulous. In its processions 1600 children each carried a gold and a silver vessel, and Athenaeus describes a vast silver *krater* with relief decoration of the Samian type and four equally enormous gold *kraters* of the Laconian type with vine wreaths, etc. These descriptions should not be regarded as exaggerations, since they correspond to the vast quantities of gold and silver vessels that were paraded in the streets of Rome as spoil from Greek cities conquered in Magna Graecia and Sicily in the late 3rd century, and from Greece itself in the first half of the 2nd century BC. Greek metal workers settled in Rome and brought their art with them (witness the masterpieces from Pompeii). A find of exceptional rarity came to light at Dion in 1992. This is a bronze *hydraulis* (water organ) of the 1st century BC. The first *hydralis* was made in Alexandria by the engineer Ctesibius. In the Middle Ages this instrument developed into the church organ of the Western Church.

Until Classical times the products of metalworking were not made for interior decoration or to serve as collectors' items. But from the moment that Lysippus made a small-scale "tabletop" Heracles for the symposia of Alexander the Great in the 4th century BC, a new relationship grew up between humans and works of art. From then on, statuettes were used for the decoration of rooms or for collection and consequently forgeries started. After the Battle of Pydna (146 BC) the Roman soldiers prised open Greek graves at Corinth, for instance, in order to collect, for sale in Rome, the *nekrocorinthia*, bronze vessels that were grave offerings, the *signa Corinthiae* statuettes, and much sought-after bronze vessels, the *aeria Corinthiae*.

Metaphysics

Metaphysics is the study of the ultimate nature of everything. The topics investigated include being, body and mind, souls and God, space and time, matter and motion, causality, identity and change, possibility and necessity, particulars and universals. Basic questions include: what is everything made of? Is it one “stuff” or many “stuffs”? What is the nature of the ultimate? What is appearance and what is reality?

Metaphysics literally means “after (*meta*) physics (*ta physika*)”. Tradition says the name was first used by the librarian Andronicus of Rhodes (1st century BC) who was cataloguing the collected works of Aristotle. Faced with an untitled work, he labelled it *Metaphysics*, because it was the next book placed on the shelf after the books Aristotle wrote on physics.

The study of metaphysics began with the speculations of the pre-Socratic philosophers. For about 200 years prior to the time in which Socrates flourished this rather varied group of thinkers sought answers about the nature of ultimate reality. The first of them was Thales (c.625–547 BC) of Miletus in Ionia. Seeking to understand nature, in terms of nature itself, Thales speculated that the source of all things in the visible world was water.

Thales’ protégé at Miletus, Anaximander (c.610–540 BC), was the second member of the Milesian school. He speculated that the ultimate was the “boundless” or “unlimited” (*apeiron*) which was a sort of odourless, tasteless, colourless, weightless, “stuff” out of which everything comes. The “boundless” also moved in a sort of vortex motion to produce the visible things of the world.

Anaximenes (fl. c.546 BC) was the third and last of the Milesian school. He speculated that the first principle of all things was air. His great achievement seems to have been the suggestion that there was continuity and serial development in the pattern of the condensation of air “downwards” into denser materials and the corresponding rarefaction of dense material “upwards”.

Xenophanes (c.570–478 BC) of Colophon objected to the theology of the poets. His problem with Homer and Hesiod, as well as many other poets, was that they told stories of the gods and goddesses engaging in shameful behaviour. They could be hateful, violent, capricious, selfish, adulterous, lying, and scheming. He speculated that there must be one ultimate god who was the source of all.

Heraclitus (fl. c.500 BC) of Ephesus is famous for the saying, “I step into a river once, but I cannot step into the same river twice.” By this he speculated that the only thing that does not change is change. He

identified the ultimate stuff of the universe with fire, but also found it to have order inherent in it. The ordering principle he identified as reason (*logos*). The Ionians (discussed above) were materialistic in their cosmological explanations. They were also monists (claiming that there is only one kind of basic reality) The Italian school (Pythagoras, Parmenides, Zeno, Melissus, Empedocles), on the other hand, claimed that ultimate reality was of more than one kind.

Pythagoras (fl. c.530 BC) of Samos moved to Croton on the south Italian coast. According to tradition, one day he passed by the blacksmith's shop and heard different pitches from hammers ringing on anvils. From this experience he developed a theory of music and a theory of the origin of the universe. For Pythagoras the discovery of quantity in everything led to the speculative belief that everything is made of numbers. This view replaces a material cause of the universe with a non-material one, namely numbers. So the origin of the universe can be viewed as coming from an intellectual source.

Parmenides (b. c.515 BC) of Elea learned of the views of Heraclitus and completely rejected the argument that the world is constantly changing. Instead he argued that change is an illusion. For Parmenides everything that exists has being, and being is the basic stuff of the universe. To say that something has being means that it is. But, if it is, then it cannot both be and not be. Change, or becoming, means that something both "is" and simultaneously "is-not". For Parmenides something either "is" or it "is-not". For something to exist and not exist at the same time would violate the laws of logic. What is can neither be created nor be destroyed, so change he concluded is an illusion.

Zeno (c.490–454 BC) of Elea was a younger follower of Parmenides. He developed a number of paradoxes to defend the view that change is an illusion. Most of these paradoxes argued that motion is an illusion. The paradoxes include the Stadium, the Arrow, Achilles and the Tortoise, and the Grain of Millet.

Melissus (fl. mid-5th century BC) of Samos famous as an admiral, became a follower of Parmenides and produced a book entitled *On Nature and Being*. Among his contributions is the view that there exists a plenitude of being in the cosmos.

Empedocles (c.492–432 BC) of Acragas in Sicily was a member of the pluralist school. He accepted Parmenides' principle of being as a starting point and then postulated four basic "stuffs" – earth, air, fire, and water. These were the roots of things. They combined and separated through love and strife. Yet these are merely appearances.

Anaxagoras (c.500–428 BC) of Clazomenae was also a member of the pluralist school. His great contribution is the idea that there is a mind that organizes the clumped stuff of the universe into an ordered

whole. Unlike the Creator of Genesis who issues divine commands, Anaxagoras' creator-god is pure mind which distinguishes and separates qualities to produce an ordered cosmos.

The Atomist school comprised the last of the pre-Socratics. Leucippus is considered to be the father of the school. Little is known for certain about his views; however, it is generally believed that his younger follower, Democritus (b. c.460 BC) of Abdera, preserved and developed his speculations. Democritus is reported to have said, "I take this material and I cut it until it can be cut no further and I have the basic stuff of the universe, 'the uncuttable' (*atome*).” An *atomos* of Democritus is different from modern atoms. It is like a tiny rock, the center of which cannot be split. Democritus taught that there are a myriad different atoms which combine by physically hooking together rather like burrs on clothing, or run freely in liquid fashion like marbles. The resulting view is that there is a plurality of atoms. Furthermore, Democritus taught that everything is made of atoms moving in the void. Even the gods are made of atoms. This meant that only atoms moving in the void were eternal. The gods, goddesses, the world, and all people were simply the product of a chance combination of atoms. Even souls were the product of atoms. In addition the forces of movement in the void would eventually produce a new rearrangement of the atoms and therefore even the gods were not immortal.

When pre-Socratic speculation failed to reach a single unified answer about the nature and origin of the cosmos, intellectual attention turned to other concerns. The Sophists focused on rhetoric, and Socrates on social philosophy and ethics.

Plato (c.429–347 BC) gave metaphysical speculation new life. Plato was deeply influenced by the teaching of the Pythagoreans. Seeking to explain both change and permanence, he combined the ideas of Heraclitus and Parmenides. Plato used the Socratic method of dialogue to seek for knowledge of the ultimate. He found the ultimate nature of the universe to be derived from ideas. Just as everything in the universe has quantity, so it also has a shape or a form (*ideos*). In the forms of things he found the ultimate stuff of the universe. The visible world is ever a world of Becoming, composed of copies of the eternal forms. These reside in the invisible world of Being. In the *Timaeus* he describes how a creator-god mixes the forms with matter to make the visible world.

Aristotle (384–322 BC), the most famous of Plato's students, wrote about the topic of metaphysics calling it "first philosophy" because it dealt with the first things of the cosmos. Among his metaphysical ideas are the four causes: material, formal, efficient, and final. He rejected Plato's forms for being as substance. Aristotle's great

achievement was to summarize in an orderly fashion and extend the speculations of the Classical period.

After the death of Aristotle the changed political conditions brought about by the conquests of Alexander the Great reoriented the focus of philosophical speculations to “philosophies of withdrawal”. Cyrenaics, Epicureans, Sceptics, Cynics, and Stoics all advocated philosophies of life which sought to find meaning in life apart from the state. Epistemology, ethics, and social philosophies were the main concern.

Neoplatonism developed a rich literature of metaphysical speculation that posited God as the source of the forms. From the 3rd to the 6th century AD this philosophy developed the idea of the chief form being the One. The One emanates or overflows in being to create the visible world. The most important members of this school were Plotinus and Proclus.

Christians encountered a dynamic mix of philosophical schools in the Greek-speaking world. In particular they found three competing cosmologies widely discussed: pantheism, materialism, and Platonism. Of these three Platonism was closest to the Christian view on the origin and nature of the world. As people of philosophical training became Christians they applied their philosophies to theological interpretation for both apologetic and dogmatic purposes.

The emperor Constantine I the Great, seeking to unify his empire on a religiously uniform basis, called for an ecumenical council of the Church to meet at Nicaea in AD 325. The debates and resulting creed were fraught with philosophical metaphysical ideas. These were used to describe the nature of the Trinity. Later councils would also deal with the *Logos* Christology of the Gospel of John in order to describe the two natures of Christ. For its theological needs Christianity utilized Greek metaphysical ideas.

Metics

Resident aliens

The word *metoikoi* in ancient Greek literally means “co-inhabitants” and was used to define the foreigners resident in an ancient city state, who had a special status and special rights in contrast to the citizens (and also in contrast to the foreigners who were only travelling through and had no rights at all). Metics existed in every Greek town (under different names, e.g. *epoikoi* or *synoikoi*), but what is known about the term is mainly shaped by the evidence from ancient Athens. There especially (though not exclusively) the development of such a status of “resident aliens” seems to have been conditioned by two factors: on the one hand, the frequency of immigration (Athens was a magnet for foreign merchants and artisans in Classical times), and on the other, the pride of native Athenian citizens who refused easy access to full citizenship. This is already reflected in Solon’s law about the exceptional admission of foreigners into the citizen body (Plutarch, *Solon*, 24.4), thereby favouring the emergence of a class of “second-class citizens”.

Metics were free people, but had lesser rights than citizens; their group was made up not only by foreigners migrating from other cities (or countries, non-Greek ones included) but also by former slaves who had been set free by their masters. In the former case, they had to be registered a certain time (probably a month) after their arrival and to pay the *metoikion*, a poll tax (which was not levied on citizens), as

well as some other taxes imposed on foreigners and a special fee if they wanted to deal in the Agora. (If they failed to pay the *metoikion*, they could be sold into slavery.) Metics had to be enlisted in an Attic deme (local community or village) to acquire the right to dwell there (in inscriptions this is indicated by the expression “living in ... “behind the metic’s name); in many cases this was Piraeus, the centre of Athenian commercial activity. Although metics enjoyed full control over their portable possessions, they were not allowed to acquire land or buy a house in Athens; therefore numerous metics put their skills into trade and crafts; the world of money transactions was largely dominated by them as well. Metics could attain *isoteleia*, i.e. citizen-like status with respect to financial duties to the polis; in court, however, a so-called *prostates* (a citizen acting as guardian) had to represent them. Metics had a clearly defined role in the city’s great festivals: they had a fixed position in the procession of the Panathenaea, and they could even function as a choragus (i.e. a sponsor) at the Lenaea, but not at the Great Dionysia. Moreover, they had to do military service, usually in the infantry. On the whole, metics had no political rights and almost never a possibility to acquire full citizen status, because that status could only be conveyed by birth, and the rigid citizenship law of Pericles of 451/50 BC even required Athenian descent on both paternal and maternal sides. Exceptionally, though, the Athenian people’s assembly (*ekklesia*) could bestow citizenship on foreigners for outstanding merits.

It is not clear how many metics lived in Athens (as also the exact number of the whole Athenian population is still a very controversial subject); a population count in the late 4th century – reported from the census of Demetrius of Phalerum probably in 317 BC – suggests that there were about 10,000 metics and 21,000 citizens. The Athenians were not always very well disposed towards the metics – they seem to have been made fun of in several comedies the titles of which are preserved – probably because there were many former slaves from “barbarian” countries among them; still, because of their commercial activities and their military service they were absolutely indispensable for the Athenian state, and in fact the barbarians among them were probably the best fitted for long-distance commerce (e.g. the grain trade with the Black Sea region), because they were acquainted with these areas. In the middle of the 4th century Xenophon (*De Vectigalibus*, 2. 6) even proposed to give more rights to the metics, arguing that their activities in Athens would enhance the prosperity of the city. Numerous metics seem to have become rich (especially famous are the wealthy bankers Pasion and Phormion), and they also used their means to cultivate their native religions: the cult of the Thracian goddess Bendis was officially established in Athens already

in 429/28 BC, and there is evidence for about 15 foreign cults (e.g. of Egyptian, Carian, Phrygian, Syrian, and Phoenician gods and goddesses) in Piraeus; moreover there are sumptuous grave stelae with bilingual inscriptions of Phoenician metics. (An alleged common cult of “Metoikios Zeus”, however, seems to be only a fancy of the late lexicographer Phrynichus.)

The status of the metics began to lose its distinctive features in the 4th century BC, when they were allowed to act in court on their own (without a *prostates*), and came to an end in Hellenistic times, when the purchase of citizenship became very frequent (probably because the law of Pericles lost much of its importance in the 3rd century, as also did the decisions of the *ekklesia*). In this period, even foreigners staying only a short time in Athens could occasionally get the status of metics, but without having to pay the concomitant taxes.

In Hellenistic and Roman times, free people living on the territory of a polis without being citizens were called *paroikoi*, in Asia Minor also *katoikoi*.

Miletus

City in Ionia

Miletus, situated on the Aegean coast at the mouth of the Maeander river, was one of the great cities of Ionia. Archaeological evidence points to Minoan and Mycenaean settlements on the site. According to Homer, the Milesians were Carians and fought on the Trojan side. Neleus son of Codrus is said to have founded the Ionian settlement.

In the 7th and 6th centuries BC, when the Ionian cities were under pressure first from the Lydians then from the Persians, Miletus took a lead in colonization, founding settlements on the Bosphorus and all round the Black Sea: notably at Abydos, Cyzicus, Sinope, Amisus, Trapezus, Phasis, Panticapaem, Olbia, Istrus, and Tomis. Subsequently a remarkable art grew up in mixed Scythian and Greek communities of what is now southern Russia. Milesians also took a leading part in the establishment of the Greek trading settlement at Naucratis in Egypt. Familiarity with Egypt and Egyptians made possible by this Greek oasis in Egypt was to have very great influence on Greek architecture, sculpture, vase painting, and many other aspects of the developing Greek civilization. In the 6th century the Milesians Thales, Anaximander, and Anaximenes started Greek philosophy. Hecataeus was a pioneer in both geography and historiography. He was also one of the leaders of the unsuccessful Ionian revolt against Persian rule (499–494). Miletus was sacked and many of its inhabitants killed, enslaved, or exiled. Between 479 and 412 Miletus was part of the Delian League which became the Athenian empire. Subsequently it was under Persian rule until liberated by Alexander the Great.

Miletus flourished in the Hellenistic period, and the Seleucid kings funded some of the monumental buildings which have been excavated by German archaeologists. Others were built when the city was ruled by the Romans from 129 BC. In AD 51 St Paul preached at Miletus. The city never became a provincial capital. It nevertheless prospered under Roman rule, particularly in the 1st and 2nd centuries AD when some remarkable harbour and market buildings were constructed. However, constant effort was needed to prevent the harbour, that was the source of the city's wealth, from silting up. The site is now 14 km from the sea. Miletus went into decline in the 4th century. Under Justinian I (527–65) Miletus received a new cathedral, the baths were restored, and the harbour dredged. The bishop, who had been a suffragan of Aphrodisias, became an autocephalous archbishop. Latros to the northeast of Miletus became a centre of monasticism. In the late 6th or 7th century a new circuit of walls was built enclosing only part of the

old city area, and within this the theatre was later transformed into a citadel. Eventually all occupation beyond the citadel seems to have ceased. Legend made the remains of the theatre into those of a palace, *palatia*, from which Balat, the modern name of the locality is derived.

The great oracular sanctuary of Apollo lies 16 km south of Miletus at Didyma. Founded and administered by the priestly clan of the Branchidae, it was very influential in the 6th century BC. It was refounded by Alexander the Great, and enjoyed another period of great influence in the 2nd and early 3rd centuries AD. It was sometimes consulted on the nature of god and responded in terms of a philosophical syncretism approaching monotheism. The oracle encouraged Diocletian to persecute the Christians. The ruins of the temple (118 × 16 m) are highly impressive.

Miletus seems to have been the setting of the *Milesian Tales* of Aristides, written around 100 BC, a collection of short, lewd, and erotic tales which were translated into Latin and appear to have influenced tales told in Lucian's *Onos* (Ass) and Apuleius' *Metamorphoses*, as well as the *Satyricon* of Petronius.

Military League

Military leagues played an important role in Greek interstate relations from the late 6th century BC. The creation of a military league was based on the agreement of two (or more) states to fight together (*symmachain*), either for a limited period or for all times. The standard

Greek term for such a league is therefore *symmachia*. Participating states were obliged to have “the same friends and enemies”. To coordinate warfare, military leagues usually established some sort of political body, such as *syndrion* (council) or a board of magistrates. The leadership was transferred to the most powerful state, the *hegemon*. Unlike a *symmachia*, and *epimachia* was defensive in character, i.e. it was limited to defensive fighting exclusively.

The earliest – and most lasting – military alliance was the Peloponnesian League. Its origins can be traced back to the mid-6th century BC, when Sparta entered into a series of alliances, starting with Tegea, in which its allies swore to accept Spartan superiority and to expel the Messenians from their respective country. Similar treaties seem to have been concluded with other poleis, most notably Corinth and Sicyon. These alliances were all with Sparta alone, so mutual obligations did not necessarily exist between the allies. The bilateral system, reflected in its designation “the Spartans and their allies”, was the nucleus of the Peloponnesian League proper as inaugurated between 505 and 501 BC, when a league congress was first established. Its main concern was to debate and make decisions (*dogmata*) on confederate wars. All members had an equal vote and enjoyed internal autonomy. Sparta’s decision, taken in its own assembly, was equal to that of the allies put together. *Dogmata* of the allies were passed with its approval exclusively. Only the Spartans could summon the congress and were privileged to supply all commanders of league forces. A treaty from the last decades of the 5th century attests the oaths taken at the reception of new members: each ally swore to have the same friends and enemies as the Spartans, to follow them wherever they led, and not to make peace without Sparta’s permission. In return, the allies were granted protection against hostile encroachment. In the 5th century the league grew beyond the Peloponnese and adopted several new members, such as Megara, Aegina, and the Boeotian, Phocian, and Locrian Confederacies. Its attraction was increased by anti-Athenian and – as explicitly stated in the Peloponnesian War – anti-democratic resentment among oligarchic states. After Sparta’s victory over Athens and its allies in 404, Athens itself was forced to join, though only for a brief period. In the 4th century two major changes in the organization of the league were introduced. By 382 it was agreed that a member state’s stipulated contribution in troops might be commuted to a contribution in cash, and that fines were to be levied on the allies that defaulted. The second innovation, brought about after 379, was to divide the league into ten geographically grouped *mere* (districts), which were presumably meant to be roughly equal in number of troops. Despite these reforms, the alliance soon disintegrated after Sparta’s defeat in

the Battle of Leuctra in 371.

The Delian League (frequently called “Athenian empire”, though the degree of Athenian “imperialistic” rule is disputed among scholars) was founded in 478/87 BC to continue warfare against the Persians after their retreat from Greece. Apparently at the request of the founding members, including Athens, had one vote in the confederate *synedrion*, to determine strategy. From the outset the Athenians provided all the league’s officials, such as the ten *hellenotamiai* (treasurers) and the commanders of allied forces, and settled which members had to send ships and which to pay money into the treasury at Delos. The first assessment of tributes (*phoroi*), allegedly 460 talents, was made by Aristides. The league fought a series of successful battles against the Persians (at the Eurymedon c.466 BC) and quickly expanded to 200 member states, most of them in the Aegean, on the west and south coast of Asia Minor, in Thrace, and in the Hellespont and Propontis regions. There was soon disaffection with Athenian leadership, however. Many states tried to secede (starting with Naxos c.470 and Thasos c.465), but were forced back in by Athens. After a defeat in Egypt in 454 BC, the treasury was moved from Delos to Athens. One-sixtieth of the allied tribute was thence claimed as an offering to Athena (see the Athenian Tribute Lists in Merritt *et al.*, 1939). Although the alliance had lost its original justification with the removal of its anti-Persian objectives – probably stipulated in the so-called Peace of Callias with Persia in c.449 – Athens continued to levy annual *phoroi* and inflicted cleruchies on members who were suspected of revolt (first known at Andros, Lemnos, Naxos, and Carystus in c.450). Disloyal states received a harsh punishment (notably Samos c.439 and Mytilene c.427). The autonomy of the allies was infringed by Athenian decrees on the legislation jurisdiction, and financial policies of the member states. Epigraphic evidence indicates a shift in the designation from “the Athenians and their allies” to “the cities the Athenians rule”. In the early years of the Peloponnesian War, Pericles openly called the Athenian hegemony a tyranny over the allies. The core of the alliance, however, remained remarkably stable throughout the war (despite a massive increase of assessment of allied tributes), which indicates that the league to some degree served the interests of the allies. After its final defeat at Aegospotami, Athens was forced to surrender its fleet and to join the Peloponnesian League. The Athenian empire was dissolved.

A second Athenian Confederacy was established in spring 378 by Athens and the founding members Chios, Byzantium, Rhodes, Mytilene, Methymna, and perhaps Thebes. After an attempted Spartan raid on the Piraeus, the Athenians invited all states to enter the confederacy on the principles laid down in the King’s Peace, so “that

the Lacedaimonians shall leave the Greeks free and autonomous". Eventually up to 70 members joined. Each state had one vote in the common council at Athens (except the Athenians), who were entrusted with the hegemony, but were not represented in the *synedrion*. The allies were guaranteed autonomy and freedom from the tribute. Athenian ownership of land or property in allied states was prohibited, i.e. the Athenians refrained from the system of cleruchies. In practice, the alliance soon deviated from these principles. By 373 BC the tributes – called *synataxeis*, to avoid the term *phoroi* – were collected to meet the costs of campaigning. Probably in 365 BC the practice of cleruchies was revived at Samos (though technically not a member of the league). The integrity of the league was severely threatened by revolts of Rhodes, Chios, Cos, and Byzantium in 357 BC (supported by Mausolus of Caria), which led to the Social War between Athens and its allies. In 355 BC Athens was forced to accept the secession of virtually all significant members, except Euboea and a few northern Aegean islands.

Unlike the partial alliances of Sparta and Athens, several attempts were made to establish a combined military league of – at least theoretically – all Greek states. The scope of a "Hellenic League" was to defend Greece proper against foreign invaders. In autumn 481 BC a Hellenic League was founded at Sparta, to meet the impending invasion by Persia. Its designation, promoted by its members and widespread among historians, is slightly misleading, since the league by no means included all Greeks. The allies agreed to end wars among themselves and to give mutual aid at all times. Each member state elected one *proboulos* (representative) and had an equal vote in the council. Since the Spartans had the greatest military strength of land forces, it was agreed that they should exercise the *hegemonia*. Athens, contributing more than half of the fleet, had some claims on the maritime command, but the allies distrusted it. The symmarchy fell apart when the Spartans withdrew from the alliance in 478 BC. A second Hellenic League was founded in 340 BC against Philip of Macedon, mainly on the initiative of Demosthenes. A *synhedrion* was established in March 340 at Athens. The hegemony rested with the Athenians, who were also responsible for the collection of allied *syntaxeis* (tributes). The league was defeated on the battlefield at Chaeronea in 338 BC. In return, Philip summoned the Greeks to Corinth the following summer and united all Greek states (except Sparta) in the so-called League of Corinth. Its constitution, set down by Philip, embodied traditional clauses both of earlier military leagues and of common peace treaties from the 4th century. Each member state had one vote in the *synedrion* and was obliged to send troops according to its population. Philip himself, the league's *hegemon*, presided over the

synedrion. The allies swore not to change their constitutions and not to revolt against the king, which reveals that the league was designed to consolidate Philip's position after Chaeronea. Its military purpose, sponsored by Philip and propagandistically heralded at Corinth, was to make war against Persia. The concept of a Hellenic League was temporarily revived by Antigonus Monophthalmus and Demetrius Poliorcetes in 302 BC, and finally by Antigonus Doson in 224 BC, envisaged as a league of federal states.

Minerals and Other Natural Resources

A large number of different minerals and other natural resources have been exploited in Greece over the centuries. Major metallic ore minerals (gold, copper and tin, silver and lead, iron) exploited in antiquity are discussed elsewhere.

Clay was a very important resource in antiquity – most was used for pottery, but some special types had medicinal uses. To a geologist the term clay applies to both a group of platy minerals, and a rock dominated by these minerals. Clay minerals are commonly formed by a chemical process – weathering of older rocks on the surface, or the action of hot water (200–400°C) associated with volcanism or the emplacement of intrusions. Most deposits of the rock clay are formed by the physical process of erosion of clay-mineral-bearing rock. The liberated clay is then transported and sorted by rivers and finally deposited in a lake or the sea. Many of these clay-rock deposits were exploited directly. However, many clays are mineralogically unsuitable for making pottery as they are too stiff or they do not fire well. Suitable clays were commonly deposited in shallow continental lakes surrounded by vegetation. Eventually accumulation of sediments made the lake so shallow that plants grew abundantly. The plants died but did not decay in the stagnant water and their remains were transformed into lignite, a low-grade coal. Some red pottery clays were also obtained from the *Terra Rosa* soils developed on limestone by washing and settling of the liquid, a treatment that resembles the natural processes.

Alumen is the name given to a natural mineral that was used as a deodorant, as a salve when mixed with honey, and as an emetic when mixed with copper salts. It was also used in dyeing, soldering, and in cloth finishing. It was probably bentonite, a clay produced by the weathering and alteration of volcanic rock, that is common on Melos.

Ochre is a red powdery earth made dominantly of hydrated iron oxide. It was used for cult purposes and as a pigment, but not as a source of iron metal. It can be produced by alteration of iron deposits or by deposition directly from springs. Ochre comprises several different minerals – haematite gives a red colour whereas the iron hydroxides goethite and limonite give yellows and browns. In Palaeolithic times red ochre was extracted on Thasos for cult purposes from one of the largest underground mines in Europe. Another important source of ochre was Moschylos on Lemnos. Lemnian earth was used from antiquity down to the 19th century for its medicinal properties, and is still used locally. It was known to the Romans as *Terra Sigillata*, or “stamped earth”, as it was made into little cakes, stamped with the head of Artemis. Lemnian earth was deposited from former springs. Rainwater falling on the nearby volcanic tuffs soaked

into the rock and broke down the minerals. Iron was thus liberated and dissolved in the water. Where the springs debouched, the iron was oxidized by the air and precipitated as ochre.

Pigments used in frescos were derived from a variety of sources, both organic and inorganic, and artificial and natural. These pigments should not be confused with glazes on fired pottery, which have very different compositions. Black pigments were based either on carbon from charcoal, or on preparations of hydrated manganese oxides which occur in some sedimentary rocks. Two different blue pigments were used. The strongest blue was obtained from imported Egyptian blue. Although dominated by copper compounds, the presence of tin suggests that it may have been prepared from bronze. A much paler grey-blue or purple pigment was derived from the mineral glaucophane, which is found in metamorphic rocks from the Cyclades. A range of red, yellow, and brown pigments were all natural forms of ochre (see above). Haematite also gives a red colour.

The bright yellow mineral sulphur was used for many purposes: the pungent fumes given off when it is burnt were used as a disinfectant and for religious purification; it had many external medical uses and was applied as a poultice; it was also used in wool preparation to make it white and soft. Sulphur occurs as the native element in volcanically active areas. It can be gathered directly from the surface and purified by melting. Sulphur has been mined sporadically on Melos and Nisyros at least since Hellenistic times. Sulphur crystallizes directly from hot volcanic vapours where they leave the ground (fumaroles). These gases are usually dominated by steam and carbon dioxide, but commonly contain small amounts of sulphurous gases which crystallize to form the mineral sulphur on or just beneath the surface. The sulphur in these gases is probably derived largely from the molten rock itself, unlike the water which is generally recycled groundwater. Sulphur does not survive for a long time on the surface as it is easily oxidized to the gas sulphur dioxide or consumed by bacteria and turned into sulphate.

Emery was important as an abrasive to shape marble and other stone. It contains corundum, a hard oxide of aluminium, together with magnetite and other minerals. It is formed by the metamorphism of bauxite layers in limestone (see below). Although it occurs at several places in the Aegean, rarely does the quality match that found on Naxos. In antiquity emery was extracted from a large number of shallow quarries, principally in the eastern part of the island. More recently it was extracted from underground mines and transported by aerial tramways to the coast.

Asbestos was used for making fireproof cloth. That used in Greece is a fibrous form of the serpentine mineral antigorite that crystallizes in

veins up to 5 cm wide in the rock serpentinite. The crystals are generally lined up at right angles to the direction of the vein, and form as the vein opens up. The ancient sources were on Mount Ochi northeast of Carystus in Euboea, but the mineral has been exploited recently elsewhere.

Very little metallic zinc was produced in antiquity, but brass, an alloy of copper and zinc, seems to have been known in Greece from about 700 BC. Zinc ore is quite common, often in association with lead and copper ores. The main ores are the sulphide sphalerite or calamine, a mineral produced by alteration of sphalerite on the surface. Metallic zinc was rarely produced because it is volatile at the temperatures necessary for smelting it. The resulting zinc vapour condenses on the sides of the furnace, where most of it is converted to zinc oxide. In some cases the oxide was the desired product as a salve, as recorded by Galen on visit to Cyprus. Pliny mentions zinc oxide as *lauriotis*, probably after the mines at Laurium. In the 19th century zinc and antimony were produced on Siphnos and Thasos, partly from mines that produced lead and silver in antiquity.

Mercury was known in the Old World from around 1600 BC. It was used for silver and gold plating (gilding) and in the recycling of gold thread from cloth but not apparently for mining gold. Mercury is a volatile metal and it was recovered from the sulphide ore cinnabar by distillation. The main sources in the Aegean were around Smyrna (modern Izmir), where the ore is associated with young volcanic rocks. In Roman times much mercury was produced in Spain.

Obsidian was a rare and important resource in the prehistoric period as it could be readily formed into sharp blades. It is a natural volcanic glass. That used in the eastern Mediterranean for blades mostly came from Melos; further west, Lipari was the main source. Obsidian was used extensively in early times for the manufacture of tools and weapons and fulfilled the same functions as flint (which forms in sedimentary rocks) did in northern Europe. It was not completely displaced by copper or bronze as it was sharper and cheaper than both metals. Only the use of iron finally supplanted obsidian in weapons and tools. However, its use did continue in ornaments and mirrors.

Bitumen (pitch), a natural petroleum product, was used in antiquity for caulking ships and wine barrels, for protecting metals, and for magical and medicinal purposes. It is the residue left where petroleum has seeped up to the surface and the lighter, more volatile components (similar to paraffin/kerosene and petrol/gasoline) have been lost by evaporation. There are natural springs and pools of bitumen near Limni Keri, Zakynthos, that were mentioned by Herodotus. The bedrock here is Plaeocene-Oligocene limestone, but the petroleum is

probably derived from deeper rocks, perhaps the Cretaceous limestones seen elsewhere in the island. In such sedimentary rocks petroleum forms from plant remains by the action of heat in the absence of oxygen. It is lighter than water and hence tends to migrate upwards through permeable rocks or along faults, unless trapped. Despite the presence of bitumen, economic reserves of petroleum have not yet been found in the region.

Amber was used for jewellery and small items. There are no sources in the Aegean region – all must have been transported overland from the Baltic sea, where it occurs abundantly along the coast. Amber is light and few journeys would be necessary to furnish all the amber found so far.

Mines and Quarries

The common use of the Greek word *metallon* to describe both a mine (e.g. Xenophon, *De Vectigalibus*, 4. 4) and a quarry (e.g. Strabo, 9. 1. 23) shows that little distinction was made between the two in antiquity. Both types of working were considered to provide resources which were of benefit to the community, either as building material or for financial profit.

Mines

Iron is found in several locations throughout Greece and the Aegean. Some of the more significant workings were in Boeotia and Laconia. It is perhaps no coincidence that the earliest Laconian currency consisted of iron “spits”. Strabo (10. 1. 9) recorded the presence of copper and iron mines at Chalcis, on the island of Euboea, though there is little substantive evidence. Iron ore was extracted on Seriphos during the 14th century by the Venetians.

Precious metals were mined at several sites throughout Greece and the islands. Silver was mined on the island of Siphnos from the Bronze Age onwards and a number of workings have been investigated at

Hagios Sostis in the northeastern part of the island; some of the ancient workings were identified as early as 1700 by P. de Tournefort. Further investigations in the 19th century and in more recent decades have revealed evidence of slag, litharge, and tuyères. Study of the workings themselves shows that metal chisels and picks were used in the galleries. Carbon samples suggest that some of this activity can be dated to the first half of the 3rd millennium BC. Further evidence of metalworking, though not of mine workings, has been found in the southeast of the island. The mines continued to be productive in the Archaic period; this is attested by the presence of Archaic pottery at Hagios Sostis, and the city felt able to dedicate as a tithe a treasury in the sanctuary of Apollo at Delphi. It was reputed to be the richest treasury at Delphi, on account perhaps of its contents rather than of the sculptural decoration on the outside (Herodotus, 3. 57). Coinage issued during the 5th century BC suggests that the mines continued to be worked after the Archaic period. It seems that the workings eventually went too deep, with the result that the mines were flooded at some point before the 2nd century AD (Pausanias, 10. 11. 2).

Some of the best-investigated silver mines in the Greek world are those located around Laurium in southern Attica. At Velatouri mining activity can be traced back at least to the Early Bronze Age. A particularly rich discovery at Maroneia probably in 483/82 BC provided funds that allowed the Athenians, under Themistocles' guidance, to construct a fleet which was to defend the Greek world in the Battle of Salamis. It seems from inscriptions and other historical records that mining concessions were leased out to individuals. Leases show that some individuals held concessions at more than one location. The system largely depended on slave labour for mining and processing of the ore. Nicias was reported to have had 1000 slaves hired to work in the mines during the late 5th century BC, and Xenophon reported that some 10,000 publicly owned slaves were employed in the mines.

Linked to the mines themselves were a number of processing installations for washing and processing the ore. One of these *ergasteria* (workshops) was the subject of a speech by Demosthenes (37). The *ergasterion* concern had been acquired by Pantaenetus and employed around 30 slaves. As the money needed to acquire the *ergasterion* had to be raised on credit, these 30 slaves had to work hard enough for the installation to make at least the 1260 drachmas necessary to pay off the interest on the loan. A series of *ergasteria* have recently been excavated at Agrileza; material suggests that they were in use in the 4th century BC. The level of output from the Laurium mines is hard to estimate and there are few firm figures. The Maroneia mine may have yielded between 50 and 100 talents (the equivalent of

1.3–2.6 tons of silver). The mines themselves were probably abandoned during the Hellenistic period, as by Strabo's day (9. 1. 23) the silver supplies were described as having failed, and indeed the slag heaps were being processed to extract ore.

The output of the Laurium mines may well have been small compared to that of mines in Macedonia and Thrace. Ancient sources hint at the wealth derived from these sources. For example, the gold mine at Dysoron in Macedonia had a daily output in the mid-5th century BC of one talent of silver (Herodotus, 5. 17). Mines controlled by Philip II of Macedon near the later site of Philippi apparently had an annual output in the region of 1000 talents (Diodorus, 16. 8. 6). The source of wealth of individual cities in the region is reflected in the depiction of metal ingots and picks on the coinage. The island of Thasos was also widely exploited by mining and Herodotus (6. 47) was able to observe a mountain which had been ransacked by such activity. Sometime in the 460s BC the Thasians came into conflict with the Athenians and as a result were forced to hand over control of their mine on the mainland opposite their island (Thucydides, 1. 100. 2). The historian Thucydides himself had control of gold mines in Thrace.

One of the more unusual materials mined in antiquity was miltos on the island of Ceos. It was used for a variety of purposes including medicine and fulling, as well as its more popular use as a wash on the surface of Attic pottery. A number of possible mine workings have been found on the island, including those at Trypospilies. There is a reference to this ore in an inscription from the Acropolis in Athens.

Quarries

Quarries, or *latomeia*, were widespread throughout the Greek world. Often such quarries are linked to building projects in nearby cities or sanctuaries. The extensive quarries of Syracuse were used as a prison for some 7000 Athenian prisoners after the disastrous Sicilian expedition. Some of the earliest examples of marble quarrying have been found at Apollona on Naxos. A number of unfinished male statues (*kouroi*) have been discovered there, including what appears to be a large statue of Dionysus which was never removed from the quarry face. Naxian expertise in working marble during the Archaic period is reflected in their major dedication of a colossal statue, along with a substantial marble base, on the island of Delos. Marble quarries have also been identified on Paros. In the Archaic period marble from the island was transported over long distances, for example for building on the island of Siphnos (Herodotus, 3. 57).

Some of the finest marble in the Greek world came from Attica itself, and in particular from the quarries on Mount Pentelikon and Mount Hymettus, which were celebrated by Strabo (9. 1. 23). Pentelic

marble, in particular, was widely used for architecture, sculpture, and inscriptions. Indeed the *metalleis* mentioned among those involved with the Periclean building programme at Athens may have been quarrymen (rather than miners). Study of stones from the Periclean buildings shows that Pentelic marble was used in a wide range of temples including the Parthenon, the Erechtheum, the Hephaesteum, and temple of Athena Nike, as well as public buildings in the Agora such as the stoa of Zeus. In the 4th century BC Pentelic marble was used for part of the Telesterion at Eleusis. Pentelic marble continued to be exported in the Roman period; for example, it has been identified at Cyrene, where it was used in the Antonine period.

The Pentelic quarries seem to have been located on the western and northeastern sides of the mountain, where the existence of some 25 quarries has been located. These were certainly active in the Archaic period, as is suggested by the find of an unfinished *kouros*. It has been estimated that some 400,000 cubic m may have been extracted. Facilities for removing the stone included the paved road which has been found at the Spelia quarry. The quarries on Hymettus may be linked to activity in the Roman period. These seem to have been located on the northwestern slopes of the mountain and also to have been served by a quarry road. Hymettan marble, with its bluish tinge, was used for the roof tiles of the Hekatompedon on the Acropolis during the Archaic period.

In spite of the quality of the marble from Pentelikon and Hymettus, other buildings in Attica were constructed of locally quarried marble and stone. Indeed it is rare for buildings in Attica to feature stone from quarries more than 4 km distant. For example, the marble for the temple of Poseidon at Sunium was extracted from a quarry in the Agrileza valley just a few kilometers away. In the workings by the cliff tower, cuttings in the quarry suggest that one of the column drums had been extracted from there. The temple of Nemesis at Rhamnous features marble quarried locally at Hagia Marina.

Attic quarries are occasionally mentioned in inscriptions. For example, one dispute related to the rent on a quarry at the Piraeus in the late 340s BC. Rent from quarries could contribute to the maintenance of cult. For example, the sacrifices at the Asclepieum at the Piraeus were paid for by the rental of the quarry, and at Eleusis quarrymen in 332/31 BC made payments to the cult of Heracles in Akris.

Black limestone from near Eleusis was used on the Erechtheum and the Propylaea. Local limestones (poros) were used for public buildings in the Agora such as the Old Bouleuterion, as well as for building projects at Brauron and the Amphiareion. Imported stones in Attica include Aeginetan stone that was used on the Erechtheum and the

Hephaestum, and Parian marble for the Hephaestum. At Eleusis stones were imported from the Piraeus, Steiria, and Aegina, suggesting the relative ease with which stone could be transported by sea.

Some of the major building projects in Greek sanctuaries required the movement of stone from quarries some distance from the place where it was to be used. For example, rebuilding of the temple of Apollo at Delphi in the 6th century BC involved marble from Paros (Herodotus, 5. 62), and in the 4th century BC the whole temple was rebuilt in limestone quarried from near Corinth. Marble imported from Paros was also used for the pediments and metopes of the temple of Zeus at Olympia. The blocks needed to carve the pair of centaurs with lapith women in the west pediment would originally have weighed some 15 to 20 tons. It has been estimated that the construction of the temple of Zeus would have required approximately 160 tons of marble.

More specialized marbles were also quarried in Greece. *Rosso antico*, also known as *marmor Taenarium*, was a red to purple fine-grained marble quarried on the east side of the Taenarus peninsula in Laconia. The quarries, noted by Strabo (8. 5. 7), may have been worked as early as the Bronze Age. Marble from here was used in the so-called Treasury of Atreus – a Mycenaean tholos tomb – at Mycenae; other examples of its use are known in Crete and Thera. The marble seems to have become popular for inscriptions during the Hellenistic period, and two honorary decrees from Delos, one for a Spartan and the other for a resident of Cythera, used the stone. It was even exported to Cyrene for a statue of Ptolemy II Soter. Sculpture in *rosso antico* also became popular in the late Hellenistic and early imperial periods. From the same area was quarried *nero antico*, a grey to black marble (Pliny, *Historia Naturalis* 36, 135).

Other exotic stones from Laconia include *verde antico*, which Pliny the Elder (*Historia Naturalis*, 36, 55) described as “brighter than any other marble”. These quarries were mentioned by Pausanias (3. 21. 4) as being near the village of Krokeai. The stone was apparently extracted like river pebbles. In the Roman period the mines may have been imperial property. Other Laconian quarries are known in Taygetus, which may have been Roman imperial property, as Strabo (8. 5. 7) recorded that they had been newly opened in his day. On the island of Euboea green cipollino was quarried in Carystus (Pliny, *Historia Naturalis*, 36. 48). Strabo (10. 1. 6) noted that in his day the quarry from which the columns came was located at Marmarium. Strabo (9. 5. 16) noted other exotic marbles from the Greek world, including “decorated” (*poikile*) marble from the island of Skyros.

Archaeological evidence for later quarrying in Greece has been hard to detect. Quarries on Mount Tisaion in Thessaly were probably

worked in the Byzantine period, and perhaps also the white marble quarry at Aliki on the southeastern coast of Thasos. The latter appears to have continued being worked into the Middle Ages.

Minoans

Bronze Age inhabitants of Crete

This people, termed Minoans by archaeologists after the legendary king Minos, created between 3500 and 1000 BC a palace-based culture akin to those of the Near East and Egypt. Many of their trappings were adapted later by the Mycenaeans of the mainland (c.1600 BC).

The varied natural terrain and therefore resources (organic rather than mineral) of this strategically placed island permitted Neolithic peoples (from Anatolia and the mainland) to prosper by 4000 BC, after three millennia of slower development: their main achievement was the tell at Knossos. Though their material culture was unspectacular, these Neolithic farmers provided the solid base on which the Minoans flourished.

During the pre-palatial or Early Minoan (EM) period (3500–2000 BC) small farming communities were increasingly established in the most accessible and fertile areas – in the coastal plains and the Mesara – though the marginal zones were also exploited and transhumance was probably practised. Many arts and crafts were established, if at a relatively simple level: ceramics, textiles, woodworking, seals, and vases of stone were developed using local resources, but trade and exchange were required to import obsidian, all metals, ivory, faience, and so on. No doubt ideas and concepts accompanied them. Houses were fairly simple, but they had acquired considerable sophistication of plan and furniture by 2500 BC. Tomb architecture tended to be communal: round tholoi were common at the centre of the island, while square bone enclosures and caves were used elsewhere. The burial customs are somewhat obscure, but inhumations were the rule. The varied grave goods deposited point to a hierarchical society. Evidence for religion (and dress) is mostly procured from clay figurines; many were deposited at open-air sanctuaries set on high peaks within sight of the villages they served.

As the population increased and more land was occupied, regional centres emerged: some (e.g. Knossos, Phaestus, Mallia) were destined to last, others (e.g. Monastiraki) were eclipsed. Since weapons were fashioned, this process was probably not entirely a peaceful one. By 2000 BC (Middle Minoan I, or MM I) the first palaces had emerged – administrative and religious centres, controlling territories in the island. The physical expressions of this development had much in common: the palaces were ranges of rooms built around a central court and oriented to the compass points. The social complexities that created them also demanded a system of writing (hieroglyphic), as well as an ever-increasing range of material products, partly for the consumption of the elite, partly for exchange in markets abroad.

Though hard to document, expertise in almost every craft was established: Kamares pottery, the exploitation of hard stones, and objects in metals are notable. New ideas continued to flow to Crete down these trading arteries, especially from the east.

Damage, perhaps from earthquakes, around 1700 BC (MM III) only served to spur on Minoan efforts: the Second Palaces arose. The next two centuries witnessed the culmination of power and material splendour – an intensification of all the existing themes. This is the likely time of Minos' thalassocracy: certainly Minoan culture was enormously influential throughout the Aegean and into the Peloponnese; Minoan traders moved and settled from Asia Minor to Egypt, visiting north Greece and probably travelling west to Italy. Modern appreciation of Minoan culture is largely based on the range and quality of goods that poured from the artisans' work areas: elegant, flowing designs; a lively palette; a concentration on natural subjects, courtly themes, and the interplay of this and the other world. The apparent harmony and balance are to our tastes, but they were not achieved in a Utopia. In comparison with the Near Eastern civilizations, the Minoans were less overtly militaristic and grandiose in their portrayal of their world; but they were not pacifists. There is ample evidence for military activities from artefacts and portrayals of warfare; some sports were violent; human sacrifice was practised. Knossos may have achieved a dominance over other cities at this time – as much through economic and religious avenues as by sheer strength. The religious centres were more localized on the palaces; chamber tombs were for collective burials of ordinary people; a few graves, as with the town and country houses, were more splendid and destined for the elite. Indeed, the building campaigns throughout the island represented a profligate expenditure of energy that may have overstretched Minoan resources: there are indications of troubled times in the 1500 BC, perhaps partly prompted by the natural disasters accompanying the eruption of Santorini. Whatever the exact mix of causes, during the last decades of LM Ib (Late Minoan Ib, after 1500 BC) settlements both great and small were destroyed, often by force, and not immediately reoccupied.

Whatever the reasons, the ultimate benefactors were the Mycenaeans, those seemingly aggressive and expanding kingdoms of southern and central Greece who took over Crete around 1450 BC. This can be deduced from the appearance on Crete of material objects, details of dress, burial customs, and other cultural traits that have precursors on the mainland. The centre (Knossos to Phaestus) of Crete became the axis of the Mycenaean power base, their control of the island being loosest in the east. Essentially, the newcomers merely adopted existing Minoan customs: by means of a scribal bureaucracy

the palaces maintained a firm grasp on the human and natural resources of the domains, assessing what was available and determining what produce was expected where and from whom. Labour forces in some intensive crafts (such as textiles) were maintained by rations and appear to have been of a subordinate status. Writing was essential to regulate this activity and the script employed is known as Linear B, a syllabary adopted from the earlier Minoan equivalent (Linear A), but now used to write Greek. The Mycenaean/Minoan elite was every bit as successful as its predecessor, the only real departure being the decline in some luxury goods.

By 1375 BC (LM IIIA1) Crete had recovered something of its former pattern of settlement and a prosperous level of material comfort (e.g. burials with bronzes): whatever the exact amalgam of Minoan and Mycenaean, society appeared to be settled. But evidently it was not: Knossos, both town and palace, went up in flames. The cause – disaffected Minoans, another jealous Mycenaean power, or some raid from further afield – is not known. The aftermath is not yet fully comprehended by modern scholarship: debate is divided between those who believe that Knossos and the Mycenaean remained in control for another two centuries, and those who think that palatial control was now mostly swept away.

Something of both factors may have been involved: the pattern of subsequent habitation and burial activities at Knossos and in the Phaestus region points to at least a decline in population and material prosperity, though at Chania something more traditional persisted for some generations. If the balance of control moved away from centralization, nonetheless a broad-based prosperity is much in evidence in the postpalatial period (LM IIIA2-IIIC). Trade networks, an integral factor in Mycenaean control of the Aegean, were still crucial to the acquisition of metals – at least one commodity can be recognized in the large-scale export of oil (perhaps perfumed) in jars manufactured in west Crete. This solid prosperity had a very practical base to it: gone are the luxurious aspects of life, gone indeed are the more rarefied crafts themselves. Gradually new religious icons (goddess with upraised arms) appear; new cultural traits gain favour (larnax, or coffin, burials); iconographies alter (increased stylization in patterns).

Though it is an island, Crete could not escape the disconcerting events that unfolded throughout the eastern Mediterranean after 1200 BC. Most of these had negative consequences for the established cultures: destruction and disturbance of peoples became common from Anatolia to Greece to Egypt. Such events are visible in Crete in the abandonment of settlements and cemeteries from 1200 BC (Later LM IIIB), in increasing material impoverishment and regionalization (e.g.

small tholoi at the east). After 1100 BC (LM IIIC) people took to the hills in scattered refugee settlements (e.g. Karphi). This erosion was periodic, but relentlessly accumulative; all but the most immediate survival needs were jettisoned. The ebb and flow may have removed some Cretans east to Cyprus, and introduced other elements from the west and north into the island, including those that later became culturally definable as Dorian Greeks. (The east of the island preserved more of its Bronze Age characteristics). By 1000 BC the Iron Age was evolving: the cemeteries north of Knossos show some continuity, retained by an energetic and emerging society with ties to Athens and further afield east and west.

What memories survived from the Bronze Age are largely centred around legends concerned with Minos; more tentative connections were kept alive by such factors as the recognition that the inhabitants of eastern Crete (the Eteo-Cretans) were in some way more “native”. Symbols derived from the Bronze Age past were always used: local pride placed the labyrinth on Knossian coins; Minoan finds were portrayed on stamps of the new Cretan state at the start of the 20th century. To many Cretans today the Minoans are somehow their direct ancestors, whose achievements are to be lauded, protected, and kept unsullied.

Missionaries

The Great Commission is the missionary duty given to Christians by Jesus Christ before his Ascension. The Gospel of Matthew reports that Jesus commanded his followers to “go out, and make disciples of all nations” (28: 19). Christianity is a universal religion that enjoins its followers to spread the good news of salvation to the ends of the earth. The universal character of the Christian faith contrasts starkly with the local or tribal and non-missionary character of most other religions.

The book of Acts records the beginning of the great apostolic missionary work, when the apostle Peter preached in Jerusalem at the Jewish Feast of Pentecost. Several thousand people became converts on that day (Acts 2: 1–41), and the new faith quickly spread to Greek-speaking Jews in Jerusalem. These were so numerous that a conflict developed between the Aramaic-speaking and Greek-speaking converts over the distribution of food to the widows in the community. To handle this a special ministry was created, the office of deacon. The first deacons all have Greek names (Acts 6: 5).

One of the original deacons, a Hellenistic Jew named Stephen, was the first martyr (*martyrion*, witness) of the Church. His death signalled open persecution, which caused the new community to disperse. This provided the opportunity for new fields of mission over the known world of the day. Acts describes how Philip, another Hellenistic deacon, converted an Ethiopian. The man is identified as a eunuch, and the treasurer of the queen of the Ethiopians (Acts 8: 26–39). The story illustrates the point that the universal message of the Gospel is no respecter of human conditions, but accepts all.

More than half of Acts is devoted to the missionary work of the apostle Paul who made three major missionary journeys. On the first he left Syrian Antioch, sailed to Cyprus, crossed the islands, sailed to Pamphilia, and then travelled to other places including Iconium before returning to Antioch. The second journey again started in Asia Minor: Paul travelled to Macedonia after receiving a vision of a man there beckoning him to come over. Eventually he arrived in mainland Greece. Everywhere new churches were started. This journey reinforced the work of the previous two.

The mission work of Paul was facilitated by the Greek language. As the lingua franca of the eastern part of the Roman empire it made communication with vast numbers of people possible. The translation of the Hebrew scriptures into Greek, the Septuagint, had occurred well before the Christian era. This meant that Paul and other missionaries could use the Old Testament in Greek. Also the widespread use of koine Greek offered a ready medium for writing the documents that eventually became the New Testament. All but five of the New Testament books are pastoral letters by Paul or others. Most of them were written to mission churches to deal with pastoral concerns.

There were many Greeks or Hellenistic Jews in Paul's circle of missionary associates. Yet from internal evidence in the Book of Acts and other New Testament sources, such as Paul's letters to Timothy who was ministering on Crete, it is evident that from the beginning much of the mission work was being done by nameless Greek-speaking individuals.

Monarchy

The political landscape of the Mycenaean period consisted of independent powers of different size with a palace as their political

and economic centre. The head of each palace and its surrounding territory was a king (*wanax* in Linear B) whose power was based on his control of the palace economy and his military leadership. It has also been assumed by scholars that the king was the high priest of his realm and thus also had a prominent cultic function. His power seems not to have been unrestricted, however, since he had to consider the demands of a strong aristocracy.

To a certain extent the societies of the Homeric epics resemble the Mycenaean world. Essentially an aristocratic world is depicted, though the terminology for the leading authorities is not absolutely consistent. Basically a single ruler and a council of noblemen have to be distinguished. The designation *basileus* for the noblemen obviously derives from the Linear B word *qasireu/pasireu*, which describes an official with certain limited powers. In contrast the *basileis* of the Homeric epics form the leading group of a community. The translation of the word *basileus* as “king” may be misleading at this stage; the terms “leader”, “lord”, or “chief ” correspond better with the actual connotation. The *basileis* of the Homeric epics are distinguished from the other people by certain conditions. They are members of the leading families, which implies that they descend more or less directly from a god and that they had a profound material basis. Within this group of *basileis* there existed a code of virtues, the most prominent of which are courage, wisdom in council, and piety. Adherence to these virtues determined the actual status of a *basileus*.

Whereas the term *basileus* is often used in the plural, the denomination *anax*, which derives from the Linear B word *wanax*, is exclusively used in the singular form, thus implying some sort of monarchical power. The word may be translated as “master” or “prince”. In each community, whether within the Greek army at Troy or in the smaller principalities, there exists just one *anax*. The *anax* himself is also a *basileus*, that is a nobleman. The *anax* fulfils a number of functions within the community: he is responsible for sacrifices; he is the commander-in-chief of the army; and he administers justice, thus combining sacral, civil, and military roles. His powers are not unlimited, however, since he has to consult the council of *basileis* on important questions. Although the actual status of the *anax* depends on his adherence to virtues, his position, being basically hereditary, is never seriously contested.

In the Archaic period the reality and the terminology of monarchy experience a considerable development. First, on the island of Cos, the term *monarchos* appears to become fixed quite early in the Archaic period to describe the phenomenon of a single magistrate ruling the polis. Second, and more important, the Greek world in the 7th and 6th centuries BC experienced the phenomenon of more or less unrestricted

monarchs ruling a polis. The term *tyrannos* for these monarchs derives from the Anatolian languages of western Asia Minor. The prototype of a tyrant was the Lydian Gyges who in the early 7th century BC came to power by usurpation. The Phrygio-Lydian term can be translated as “chief” or “master”.

While the word *tyrannos* was absent from Homer and Hesiod, archaic poets, especially Solon, Theognis, and Alcaeus, contrasted it to the denomination *basileus* as actually expressing the opposite of aristocracy: the monarchical power of a tyrant contradicted the claims of the aristocratic class for equality (*isonomia*) among themselves. The tyrant, as a member of the leading group which consisted of *basileis*, aimed at monarchical power, thus opposing the values of his class. This opposition to the values and virtues of aristocratic society was called *hybris* (presumption, insolence). In the Archaic age therefore to be a tyrant meant being in the possession of monarchical power, but not necessarily being a violent despot. That meaning of the term developed in the course of the experience of violent rule of tyrants and within the theoretical discussion of the Classical period.

Whereas tyrannies, especially in Ionian Greece, continued to proliferate under Persian rule, in mainland Greece they had mostly disappeared by the end of the 6th century BC. In the 5th century BC some monarchies existed at the fringes of the Greek world, in Macedonia, Epirus, and Aetolia. In central Greece with the growth of democracy and in the aftermath of the Persian Wars a negative view of monarchical power prevailed: it was regarded as a form of government fitting slavish barbarians, not the free citizens of a Greek polis. Sparta had had a double kingship since Archaic times, but for the limited power of these kings the term monarchy is not really appropriate.

The movement of the Sophists stimulated theoretical discussions about different forms of government. It was in this context that monarchy began to be regarded at least theoretically as a good form of government. The rise of new monarchies in the Greek world in the 4th century BC and especially the growing power of the Macedonian monarchy under Philip II stimulated a wide-ranging discussion on the basis of the terminology of the Sophists. The discussion is well reflected in Aristotle's *Politics* (3. 14–18, 4. 10). Theoretically monarchy could have a good form, *basileia*, and a bad one, *tyrannis*. The shift of meaning since the Archaic period is noticeable. The main criterion for *basileia*, to be translated here as “royalty” or “kingship”, was to rule according to the law and for the benefit of the subjects. Against this, tyranny meant the usurpation of power to rule for one's own benefit.

In the 4th century BC several treatises on kingship were written,

sometimes aimed at particular kings, e.g. the “Cyprian orations” of Isocrates to Nicocles. In those treatises the picture of an ideal king was developed. A common model of an ideal king was the Persian Cyrus about whom Xenophon’s treatise *Cyropaedia* has survived. Plato developed the concept of the philosopher king possessing absolute knowledge and goodness. Treatises of the 4th century BC have some basic features in common. Essentially the ideal king is portrayed as ruling for the benefit of his subjects which requires him to be generous, to be a military figure, and to be very pious.

Monarchy became the predominant political feature in Greece after the conquests of Philip II and his son Alexander the Great. After his conquest of central Greece Philip became the leader (*hegemon*) of the Corinthian League. It has to be remembered that the constitutions of the Greek cities remained unchanged. With Alexander the character of Greek monarchy changed considerably. After his conquest of Babylon in 330 BC he assumed the Persian title “king of Asia” and tried to model his royalty on Persian kingship, but he met the resistance of his Macedonian companions. Eventually his monarchy turned out to combine Persian and Macedonian elements and some new characteristics. The most important new feature was the order to the Greek cities in 324 BC to grant him divine honours, which was inspired by his achievements as conqueror and his unlimited monarchical power.

After Alexander’s death in 323 BC and the wars of the Successors the Macedonian rulers of his divided empire in 306–304 BC assumed the title *basileus* themselves. By this time, royalty had become primarily dependent on military conquest. The ability to lead an army decided the royal status. Like Alexander, the Hellenistic kings regarded their territory as spear-won land and thus as a personal possession. The other predominant prerequisite of royalty was wealth. The nuclei of the Hellenistic monarchies, as with the Macedonian and Persian monarchies, were the companions (*philoi*) of the king, a group of nobles who together with the army formed the royal establishment. “King, friends, and army” was a common phrase in Hellenistic times.

Apart from these common features the Hellenistic monarchies had considerable differences. These primarily depended on the traditions of their subject peoples and the structures of their empire. The Ptolemies in Egypt established themselves in the tradition of the pharaohs. The Seleucids, who reigned in Syria, but whose empire at its peak stretched as far as India, had many different traditions to cope with. In general they showed piety towards indigenous gods. Both the Ptolemies and the Seleucids received divine honours from the Greek cities. They were honoured as liberators of the cities, as founders, or as benefactors. The cults could be for the worship of the living ruler or

of his dynasty. In contrast the Antigonids in Macedonia did not received divine honours.

In the Hellenistic period a wide range of treatises on kingship were written. Like their predecessors of the 4th century BC, they were mostly aimed at particular rulers. Most of the treatises are lost, but a good insight is provided by the 3rd century BC *Letter of Aristeas* and the Neopythagorean writers Ecphantus, Diotogenes, and Sthenidas. The virtues and achievements of a king according to these treatises are military leadership, generosity, philanthropy, wealth, justice, security, and peace.

With the battle of Actium in 31 BC the last Hellenistic monarchy fell, and for 360 years the Greek world was ruled from Rome. Many traces of Hellenistic monarchy may be observed in the Roman principate. With the establishment of Constantinople as capital of the eastern Roman empire and the final division of the empire in AD 395 the circumstances of monarchy in Greece changed considerably. The emperors regarded themselves as Romans and Christianity was the imperial religion. The official ideology of the emperor consisted of his being chosen by God as lord over the world, as his vicar on earth. The way to power was usually by usurpation: when the usurper was successful, this meant he was chosen by God. Thus, as in previous periods, military victory was one of the determinants of imperial status, both internal and external.

Mosaic

Mosaic is a surface decoration consisting of different particles, such as stone or glass, set in a foundation, usually a mortar bed. It is primarily a form of monumental decoration, but it may also be used on a small scale.

The earliest mosaics, dating from the 4th millennium BC, were found in Mesopotamia. Mosaics existed in ancient Egypt and Minoan Crete, ancient Greece, the Roman Empire, and its Christian successor states, as well as in the medieval Islamic world. There are extensive survivals of early Christian and medieval mosaics in Italy, but the importance of mosaic as an art form there diminished in the Renaissance; north of the Alps mosaic was used only sporadically during the Middle Ages. In Byzantium the medium was exploited on a vast scale, even though its use as the most expensive form of Orthodox Church decoration declined in the second half of the 14th century. Mosaic was revived as a monumental decoration in western Europe in the 19th century, and continued to be employed in the 20th.

Even though pebbles and other natural materials are used for mosaics, in its more developed form it is made from square or rectangular particles specially shaped for the purpose, known as *tesserae* (Latin: “dice”). The more regular shape of the tesserae makes for greater precision in laying the mosaics and allows for special visual effects. The size of the tesserae is often varied, small cubes being used for faces and hands and larger ones for drapery and backgrounds. Apart from different types of stone, tesserae are made of

glass and terracotta, but mother-of-pearl, shells, and semi-precious stones have also been found among mosaics. At times, mosaics are touched up with paint.

Glass tesserae are found in Roman mosaics from the 1st century AD. They were employed primarily in wall mosaics, because their brittleness did not make them suitable for floor covers. The effects of glass mosaic on walls were exploited fully only in the medieval period. Ancient and medieval glass was made from sand, potash, and lime and coloured with metal oxides; tesserae were produced by breaking sheets of glass into small particles. Gold tesserae were made by placing gold leaf on a sheet of glass and then enclosing it within another layer of glass. In early gold tesserae the lower layer of glass was colourless, but from the 8th century onwards red glass came to be used, adding lustre to the metal. Silver tesserae are made by using either silver or tin leaf. Gold and silver tesserae were rarely used before the 4th century AD.

Wall mosaics were executed in situ on a scaffolding. The tesserae were placed in the last of several layers of mortar or plaster that coated the wall (on curved surfaces nails or clamps served to hold the plaster in position). The final layer of plaster was applied in patches corresponding in size to the amount of tesserae that could be laid by the mosaicists before the plaster dried up. Rough outline drawings or, at times, highly finished paintings (e.g. at the Kariye Camii in Istanbul) were applied directly to the plaster to guide the craftsmen. Very little is known about the working methods of mosaicists. The 12th century mosaics in the church of the Nativity at Bethlehem are signed by a certain Ephraim who identifies himself as a painter and mosaicist, but usually there was probably a distinction between artists designing the imagery and those executing the mosaics, not to mention artisans specializing in preparing the plaster bed. Mosaicists are likely to have worked in teams. Larger areas requiring a single colour may have been worked on by apprentices, leaving the faces and other details to more highly skilled craftsmen. In order to facilitate the laying of mosaics, the tesserae were probably sorted into trays according to colour and size. A technical examination of the 11th-century mosaics in St Sophia at Kiev, which appear to have been executed by Byzantine craftsmen, has given some idea of the speed at which mosaics were laid: the 640 square metres of mosaic were executed in 320 days.

Even though there are some examples of mosaics on the outside of churches, especially in the Italian peninsula, wall mosaics are essentially a medium for the interior of buildings. In dimly lit interiors and on curved surfaces they are a visually more effective medium than fresco. In Byzantine art, in particular, the properties of mosaic are

exploited to full effect. Mosaicists used the curved surfaces of domes, squinches, and apses to catch the natural light in order to make the mosaics sparkle and glitter. The refraction of natural light on the tesserae is enhanced by the irregular surfaces; cubes tilted at different angles and irregularly spaced are essential to creating glitter. Mosaic is, however, an inflexible medium because it consists of blocks of pure colour. But because mosaics were designed to be seen from a distance, mosaicists were able to overcome this limitation and created, in the eyes of viewers, the optical illusion of colour gradation.

The earliest surviving mosaics from ancient Greece are the pebble mosaics from Gordium in Asia Minor (8th century BC). Pebbles were used to represent mythological scenes at Olynthus (c.400 BC) and Pella (4th century BC), both in northern Greece. Gradually, mosaic makers realized the advantages of using tesserae. At the temple of Zeus at Olympia pebbles are used in conjunction with cut stones. Mosaics made of tesserae from the 2nd century BC exist on the island of Delos. Pergamum was an important centre of mosaic production. Sosos, who, according to Pliny the Younger was the most famous mosaicist of the ancient world, is said to have been active there. He is credited with having invented the motif of the *asarotos oikos* ("unswept floor") and of doves perched on a vase, both motifs being widely used in Hellenistic mosaics. Greek mosaicists were active at Pompeii, as is suggested by the name Dioscurides of Samos, which is found in two Pompeian mosaics. The surviving mosaics at Herculaneum include not only floor but also wall mosaics, as well as mosaics embellishing garden furnishings, such as fountains and niches. There are extensive survivals of late Roman mosaic floors at Antioch (3rd century AD). The bucolic scenes in the floor mosaic of the imperial palace at Constantinople are a very late example of this tradition, dating from the 7th century AD. Floor mosaics also occur in some Christian churches (Aquilaia, 4th century; Palestine, 6th and 7th centuries; 12th-century France and Italy), but the rarity of such floors indicates that Christian subject matter was generally considered unsuitable for floors.

Museum of Alexandria

The *Mouseion* (Museum) in Alexandria was the most famous of all in antiquity. The members of a *mouseion* were originally connected with the cult of the Muses, who were worshipped at an altar, often in open-air porticoes or courts rather than in a temple, and were dedicated to the arts inspired by them. They were significant centres of literature and education, and often the focus of a society dedicated to the creation of literary compositions.

The Museum was located at Alexandria in Egypt, a city founded by Alexander the Great in 331 BC. Although we cannot as yet identify its exact location within the ancient city, we do know that it was near, or in the grounds of, the royal palace, or *Basileia*, which lay close to the harbour on the northern side of the city. It was founded in 280 BC by Ptolemy I Soter, one of Alexander's generals and a historian himself, on the advice of Demetrius of Phalerum. The latter had been one of Aristotle's pupils at the Lyceum in Athens, but was expelled from the city for his pro-Macedonian sentiments. Demetrius was influenced by the so-called Peripatetic school's approach to the acquisition of knowledge, and upon his arrival in Alexandria he persuaded Ptolemy I to establish an institution dedicated to the pursuit of knowledge along the lines of the Athenian model. The Museum was greatly expanded by Ptolemy II Philadelphus (308–246 BC).

Since we do not have any extant remains, we must rely on Strabo's description of it (*Geography*, 17. 1. 6–10) during the period when he was resident in the city – the late 1st century BC. He states that the Museum was part of the royal palace, and served as a gathering place for scholars, artists, and literary figures who held property in common. The facilities consisted of an *exedra*, or crescent-shaped arcade with seats for lectures, a *peripatos*, or covered walkway planted with trees where discussions often took place, and a large house with a communal dining area.

We know that the Museum was separate from, but closely associated with, the Library, also established by Ptolemy I. It may have had its own collection of books housed in nearby storerooms, but this is only conjectural. The names of those associated with the institution are not known, except for its last member, Theon (c. AD 380), but a number of prominent scholars and scientists lived in Alexandria, some of whom were affiliated with the Library, and no doubt participated in some of the activities at the Museum. These scholars were drawn from a variety of disciplines – both literary and scientific – and are represented by individuals such as Euclid, Eratosthenes, Callimachus, Apollonius Rhodius, Herophilus, Aristarchus of Samothrace, Aristarchus of Samos, Aristonicus, and Apelles. They flourished in an environment of sophisticated literature at the court and the metropolitan atmosphere of the city.

Ptolemy I Soter followed in the tradition of enlightened cultural support practised by kings and tyrants from the 6th century BC (the Pisistratids in Athens and Hieron in Sicily) down to the Macedonian kings in the 4th century BC. There was also a tradition in Egypt, as in the Greek world, of the association of religion with learning, and temples served as centres of literacy and repositories for knowledge. A third factor was the competition between the successors of Alexander the Great for cultural supremacy in an empire divided into factions after his death. The forerunners of the Museum at Alexandria were Plato's Academy in Athens, where the emphasis was on science and philosophy, and Aristotle's Lyceum, also in Athens, which was concerned with the systematic collection, organization, and preservation of knowledge.

The Museum flourished under the rule of the Ptolemies (304–31 BC) and received continued support under the Roman emperors. Its members served as a group of resident scholars invited to Alexandria by the king, who then maintained them at his expense. They were provided with living quarters and food and given salaries; they were also exempt from taxation. The king appointed a president who served as an administrator, or *epistates*, and the priest in charge of the cult of the Muses (*hiereus*). The primary focus was on research, although there may have been lectures, but its members were not required to teach. Dinners and symposia were held, characterized by a search for solutions to a stated problem; the resolutions were later recorded on papyri. Scholars were drawn from all parts of the Greek world to participate in state-subsidized learning – the acquisition of knowledge for knowledge's sake, rather than as the means to a specific end.

Research at the Museum focused on science and literature, unlike its Athenian predecessors, which often emphasized philosophy. In the field of science, the emphasis was on experimentation and the collection of empirical data to support observations and theories, resulting in the development of a scientific methodology for the solution of problems. Textual criticism, and the collection and cataloguing of literary works in order to ensure the preservation of knowledge of Greek and other Near Eastern civilizations – an antiquarian approach to history – were the hallmarks of the institution's literary endeavours. In the course of textual criticism, critical judgements were made regarding the relative importance of different versions of a single text. Revision involved the weeding out of versions considered to be inferior. It is clear from the papyri that one of the great contributions of the Museum was the stability of the texts of ancient authors, especially Homer.

The environment created in the Museum was one of a “worldwide” intellectual tradition resulting from a fusion of oriental and

Mediterranean knowledge with an international centre of culture at Alexandria, where the study of science and literature flourished. This in turn contributed to the formation of a fairly uniform metropolitan urban civilization in the Hellenistic period, of which Alexandria was one of the first examples. The Museum was instrumental in the development of the concept of an institution dedicated solely to the acquisition of knowledge, a forerunner to the universities and research institutes of the present day.

This changed somewhat in the 2nd century BC, when the native segment of the population at Alexandria reacted against the influence of Hellenism. It was reinforced by an economic crisis characterized by rising prices and social unrest, in addition to hostility among members of the royal family. Ptolemy VI Philometor expelled foreign scholars and immigrants (c.146 BC), and their places in the Museum were occupied by native Alexandrians. Now other centres of culture and learning competed with Alexandria for scholars and students – at Pergamum, Athens, Antioch, and Rome. At this point the city lost its position as the primary cultural centre of the Greek world.

The fate of the Museum is still disputed. It seems to have escaped destruction in 48 BC when Julius Caesar burned the ships in the nearby harbour, setting part of the royal quarter on fire. It enjoyed renewed prosperity under the *Pax Augusta*, and the Roman emperors visited and extended the buildings, especially the philhellene Hadrian. In the Roman period the acquisition of knowledge became more secularized, but Alexandria continued to be an important centre of Greek learning. Many renowned residents and visitors were still associated with its research institutions, such as Plutarch, Ptolemy of Alexandria, Lucian, and Plotinus.

Research in science and medicine flourished, as did the study of philosophy which was closely intertwined with religion, but there was a marked decline in literary endeavours. In the 2nd century AD it was famous for the New Rhetoric, and in the 3rd century for Neoplatonism. The Museum suffered under Caracalla, who expelled its foreign members and abolished sustenance payments for others in AD 216. It appears to have been destroyed by Aurelian after the city made an abortive attempt at independence after his defeat of Zenobia, queen of Palmyra, in AD 272, but it soon resumed its activities. In the 4th century Ammianus Marcellinus (22. 16) reports scientific activity, but admits that there was a decline in scholarship. In all probability the Museum did not survive long after Theodosius I's edict in 391 requiring the destruction of all pagan temples.

The collected and evaluated information and wisdom of antiquity, as well as new strides made in the acquisition of knowledge in a variety of scientific and literary fields by members of the Museum in

Alexandria, have been transmitted to the present day through Islamic rulers, who were themselves very interested in Graeco-Roman civilization. In the Arab world of the 7th–11th centuries there was a period of cultural awakening characterized by an interest in learning, and translation of ancient texts by Arab scholars. Great libraries and research centres based on the Alexandrian model, such as the one at Baghdad, were established in the Islamic world. The knowledge acquired by scholars in Hellenistic Alexandria was essential to the scientific experiments of Arab scholars, also conducted according to scientific methods of research developed in that city's institutions.

The Museum at Alexandria, then, was the inheritor of the Classical Athenian tradition of the acquisition of knowledge in an environment dedicated solely to that purpose. It in turn passed that tradition on in a new form, developed as a result of its position as the centre of Greek culture in the 4th and 3rd centuries BC, and the institution continued to diffuse the heritage of Greek culture to the rest of the world in the Hellenistic and Roman periods. Its members contributed a new body of scientific information and methods, and procedures for textual revision and literary criticism in addition to their efforts at collection, collation, and preservation in an attempt to save the knowledge of the past. The Museum passed on a tradition of pure research in the context of an institutional setting to other Graeco-Roman centres as well as the Arab world. Medieval and Islamic scholars, and later Christian scholars and humanists of the European Renaissance interested in Greek and Roman civilization, built on the foundations developed at the Museum in Alexandria. They too established their own research centres dedicated to higher learning – the forerunners of modern-day universities and research institutes.

Music

Music has featured prominently in Hellenic society since the dawn of Greek civilization. The dominant form of musical expression for all periods has been song, the sacred and secular genres of which have included cultivated, rural (“demotic”), and popular repertoires. Despite the existence of Hellenic systems of musical notation since at least the 3rd century BC, the historical reliance of Greek performers on oral methods of transmission has resulted in the loss to posterity of most pre-modern melodies. All of the complete works and substantive fragments preserved from antiquity in vocal and instrumental notations based on the Greek alphabet, for example, fit comfortably on a single compact disc. This loss is offset to some degree by the survival of many ancient song texts, from which certain rhythmic details may be recovered, as well as by rich philosophical and theoretical traditions of writing about music. No secular melodies have been preserved from the Byzantine empire, but its liturgical chant is transmitted in neumatic notation by an impressive body of manuscripts dating from the 10th to the 20th century AD. However, the realization of these neumed sources presupposes knowledge of orally transmitted conventions of performance practice, the amount of which increases with the antiquity of the manuscripts.

These daunting gaps in the historical record have made it difficult for scholars either to trace the development of Hellenic music as a continuous tradition or to draw more than superficial conclusions about its diachronic character. Interpretation of the available evidence, particularly with regard to the musical effects of interaction with neighbouring peoples, has been further complicated by the cultural politics of the 19th and 20th centuries. While some Greek scholars have made exaggerated claims for continuity, Western musicologists have until recently tended to see mainly discontinuity between the musics of ancient Greece, Byzantium, and modern Greece. Reflecting such broader cultural phenomena as the struggle to define a modern Greek identity in the face of Western expectations, these views have led to a priori rejections by various groups of a wide array of living and historical repertoires as unacceptably tainted by foreign influence, usually identified as either “Arabo-Turkish” or “Western”. These criticisms notwithstanding, only in the later decades of the 20th century has the study of problems for which enough

sources survive to make comparative study meaningful – for example the relationship of post-Byzantine and Ottoman music – progressed sufficiently to yield reliable preliminary results.

The following brief historical survey will be limited to music created and performed by speakers of the Greek language. Further developments of Hellenic musical traditions by others – notably the medieval Latin, Arabic, and Turkish extensions of ancient Greek and Byzantine music theory, and the impact of Renaissance humanist study of Classical Greek music and drama on the development of opera – will therefore not be considered. For technical expositions of Greek and Byzantine music theory, readers are referred to the specialized studies in the appended bibliography.

Portrayals of musicians and musical instruments in Cycladic, Minoan, Mycenaean, and Cypriot art of the 2nd and 3rd millennia ^{BC} show that these societies employed music in public ritual and domestic entertainment. Echoes of these early traditions may be discerned in the narratives and poetic structures of the Homeric epics, works which mark the transition from an era of purely oral transmission to one in which the texts of certain cultivated genres of song were regularly committed to writing by their poet-composers. Witnesses to the subsequent development of Hellenic music include the texts of Greek lyric poetry, literary references to music, and depictions of musicians in pottery and other art. A formative era reportedly marked by Phrygian and Lydian influence was followed in the 7th and 6th centuries ^{BC} by the emergence of regional schools of composition and the diffusion of their characteristic forms. Lesbos produced intimate monody in the form of Sappho's Aeolian lyric, while more public forms of art were encouraged by the city states of the Greek mainland through their sponsorship of music competitions held in conjunction with such civic and religious festivals as the Spartan Carneia and the Pythian Games of Delphi. At these events professional soloists demonstrated their skill on the *kithara* (lyre) and the *aulos* by performing set pieces (*nomoi*), while choirs of amateur singers and dancers were incorporated into presentations of choral lyrics, out of which eventually developed both the Dionysian dithyramb and tragedy.

As the traditional repertories of cultivated song reached their apogee in the 5th century ^{BC} with the works of Pindar and the Attic tragedians, the study and performance of *mousike* – music conceived as an indissoluble complex of poetry and melody – achieved an unprecedented (and since unequalled) level of significance in Greek society. The ideal Hellenic gentleman thus became a cultivated amateur musician trained by an educational curriculum in which poetry sung to lyre accompaniment held a place of honour. By the

turn of the 4th century BC, however, the cultural consensus surrounding music began to dissolve in the face of internal and external pressures. Melodic and metrical innovations by such composers as Euripides and the virtuoso Timotheus (c.450–c.360 BC) transgressed the stylistic boundaries between traditional genres, provoking harsh criticism from Aristophanes and other musical conservatives. Symptomatic of these changes was the progressive replacement of an older modal system of melodically and rhythmically distinct modes (the Dorian, Phrygian, etc. *harmonia*) with a complex system of interlocking scales (also called *harmoniai*) designed to facilitate modulations. The bonds between music and poetry in Greek culture were thus left greatly weakened for the remainder of antiquity, as were the ties between amateur and professional music making. Although musical performances remained ubiquitous in the Hellenistic and Roman periods, vocal and instrumental music outside cult and state ceremony was largely reduced to entertainment. Professional musicians, whether male virtuoso kitharists or female *aulos* players offering sexual services to symposiasts, were accordingly relegated to a low place in the social order.

Perhaps the most enduring musical legacies of the Classical period are to be found in the critical, scientific, and speculative traditions of writing about music that emerged from it. The figure of Pythagoras (fl. c.530–497 BC) stands at the head of two complementary streams of Greek musical thought: the one emphasizing philosophical, social, and metaphysical concerns, and the other a theoretical tradition originally concerned not so much with the craft of composition (the subject of most Western “music theory” since the Renaissance) as with the physics of sound and the systematization of tonal systems. Fundamental to both approaches was a belief in a kinship of mathematics and music, a concept extrapolated from observing that a resonating string divided in length according to the ratios 2:1, 3:2, and 4:3 produced the intervals of, respectively, an octave, a fifth, and a fourth. The influence of Damon and other early authors whose writings are now lost may be discerned in the works of Plato, a musical conservative who eschewed the use of technical terminology while exalting an idealized version of the previous century’s cultivated amateurism. In the *Laws* and the *Republic*, Plato assigned *mousike* a prominent but carefully regulated role in education by emphasizing the governance of texts over melodies, which should be set only in the Dorian and Phrygian *harmoniai*. He wished to ban the remaining modes from his perfect state because of their inherently unsuitable ethical qualities, thus reflecting his belief that each of the Greek modes possessed a distinct ethos which could be imparted through habituation. The means for achieving these effects are intimated in the

Timaeus, in which Plato echoes Pythagorean doctrine by suggesting that both the human soul and the universe as a whole are constructed according to the mathematical proportions of the harmonic series. Aristotle, while sharing Plato's distaste for contemporary virtuosity, rejected such metaphysical speculations in favour of a more empirical approach. Believing that ethos could be mediated by abstract instrumental as well as texted vocal works, Aristotle saw the ethical force of music arising from the embodiment of emotional states in sound and rhythm, a theory subsequently disseminated by his students and further developed by the Stoics. Although advocating in his *Politics* a total proscription of the *aulos*, Aristotle more closely reflected the societal standards of his time by admitting all the modes and accepting entertainment alongside education as a legitimate use of music.

Treatises of music theory also demonstrate a remarkable degree of continuity from antiquity through the Byzantine period, the significance of which is much debated because of uncertainties about the degree to which theory and practice diverged after the 4th century ^{BC} as the academic study of music became firmly entrenched among the sciences. Ancient theorists pursued two basic approaches to the definition of tonal space, both of which may be regarded as approximate theoretical rationalizations of actual practice: the accurate but cumbersome Pythagorean tradition of defining musical intervals arithmetically according to ratios of string lengths; and the linear method of Aristotle's student Aristoxenus, who believed intervals to be capable of infinite subdivision and proffered scales built on units of equal size. All ancient theorists after Aristoxenus, however, followed him in constructing larger tonal systems spanning two octaves (the Greater Perfect, Lesser Perfect, and Immutable Systems) from sets of conjunct or disjunct perfect fourths. Whereas the outer notes of these tetra-chords were fixed, the relative positions of their inner pitches were determined by their genus (diatonic, chromatic, or enharmonic) and "colour" (*chroa*). In the surviving fragment of his *Harmonics*, Aristoxenus gives the following sequences of whole (= 1) and fractional tones for the tetrachord E-F-G-A:

	<i>Sequence of Intervals</i>
<i>Genus</i>	<i>(E - - - A)</i>
Tense diatonic	$\frac{1}{2}-1-1$
Soft diatonic	$\frac{1}{2}-\frac{3}{4}-1\frac{1}{4}$
Tonic chromatic	$\frac{1}{2}-\frac{1}{2}-1\frac{1}{2}$
Hemiolic chromatic	$\frac{3}{8}-\frac{3}{8}-1\frac{3}{4}$
Soft chromatic	$\frac{1}{3}-\frac{1}{3}-1\frac{1}{6}$
Enharmonic	$\frac{1}{4}-\frac{1}{4}-2$

The theories of Aristoxenus were rearticulated in a group of treatises from the first few centuries AD, some of which modify them with material drawn from the Pythagorean tradition. These works include the comprehensive expositions of Claudius Ptolemy and Aristides Quintilianus, as well as the practical handbooks by Cleonides, Gaudentius, and Alypius, the last of which contains the fullest surviving account of the vocal and instrumental systems of ancient Greek musical notation. Manuscripts of these and other theoretical treatises not only continued to be studied and copied throughout the Byzantine period, but some treatises previously identified as Late Antique may have been compiled at the court of Constantine VII Porphyrogenetos (913–59). Western scholars have nevertheless customarily dismissed Byzantine interest in the theoretical tradition of antiquity as encyclopedism covering an ever-widening gap between musical theory and practice. This hypothesis is currently being reconsidered by researchers who see evidence for a dynamic application of ancient theory to liturgical music in an enigmatic compilation known as the *Hagiopolites* (a 14th-century manuscript some of whose contents may be several centuries earlier), as well as in the discussions of modal theory contained in the late-13th-century treatises of Manuel Bryennios and George Pachymeres.

Mycenae

Bronze Age type site

Mycenae stands on a rocky knoll tucked into the northeast corner of the Argolid. Today it appears as a walled citadel with an external circuit of about 1 km. On the slopes to the north and west lie areas of settlement and beyond that at least 250 family chamber tombs in 27 separate cemeteries. These lie along a network of well-built roads which link the site to the rest of the Argolid and to the Corinthia to the north. The overall area thus used has been estimated at 32 hectares.

The site is known from Homer as the home of Agamemnon, leader

of the Achaean forces before Troy, and has been the scene of archaeological investigation since the middle of the 19th century when in 1841 Kyriakos Pittakis completed the clearance of the Lion Gate on behalf of the Archaeological Society of Athens. Heinrich Schliemann's excavations of 1874 and 1876, which followed his work at Troy, disclosed the rich tombs now known as Grave Circle A and brought international renown. These finds form the spectacular core of the Mycenaean Room in the National Museum at Athens. The site has given its name to the Late Bronze Age civilization of mainland Greece but its remains are too rich for the site to be considered typical of that period. Subsequent research has been by the Archaeological Society: Panaiotis Stamatakis, Christos Tsountas, Ioannis Papadimitriou, George Mylonas, and Spiros Iakovides, and (through the generosity of the Archaeological Society) by the British School at Athens (BSA): Alan Wace and Lord William Taylour. The site was mapped in 1887/88 by Bernard Steffen; an area survey by Iakovides and Elizabeth B. French (BSA) has recently been completed.

It is now known that the site was settled in the Neolithic period (6500 BC) but only became rich in the late Middle Bronze Age (c.1650 BC) when it seems to have taken over hegemony of the Argive plain from Argos. A series of warrior princes were buried in shaft graves (Grave Circles B and A) or, later, in built tholos tombs of which there are nine in total in three groups of three. There was a bureaucratic, centralized, possibly "palatial" society. Overseas links extended throughout the eastern Mediterranean and as far as Italy, Sardinia, and on occasion Spain to the west. It seems probable that it was the ruler of Mycenae to whom a letter from the Hittite king was addressed using the terms "Brother" and "Great King". At Mycenae itself, as elsewhere on the mainland of Greece and at Knossos, records were kept in the Linear B syllabic script, shown by the decipherment by Michael Ventris in 1952 to be an early form of Greek. This society collapsed around 1200 BC, probably as the result of earthquakes which disrupted the elaborate economic system. There was however no cultural break and the site continued to be inhabited, though by ever smaller numbers of people, until the Persian Wars when Herodotus says Mycenae, with Tiryns, sent a contingent of 400 to fight at Plataea. The name is inscribed on the serpent column which originally held the memorial tripod for this battle at Delphi but was later removed to the Hippodrome at Constantinople. The continued inhabitation of the site may have been linked to its control of Argive religious centres or to its position in Greek mythology. As well as an Archaic temple (of Hera or Athena) on the summit of the acropolis, there are Archaic dedications at the Treasury of Atreus and a shrine with dedications to Agamemnon of Hellenistic date, though the shrine

itself originated in the late Geometric period. It has been suggested that this timing may reflect the circulation of the Homeric poems.

In 468 BC the town was attacked and captured by Argos and its fortifications disabled. The 5th century BC tragedians, when dealing with the myths of the Oresteia cycle, mix Mycenae and Argos. Details in Aeschylus' *Agamemnon*, particularly the account of a series of beacon stations linking to Troy, seem to belong to Mycenae itself and the naming of Argos is thought to reflect political considerations at a date, 458 BC, soon after the downfall of the site. Schliemann thought that Euripides must have known the site in order to describe it so tellingly.

In the Hellenistic period Mycenae was revived as a *koma* or fortified settlement by Argos; the citadel walls were repaired, the lower town enclosed by a wall, the temple rebuilt, and a theatre and fountain house built. This town gradually declined and by the 1st century BC to the poets of the *Greek Anthology* (notably Alpheus of Mytilene) had become a byword for faded glory. However, in the 2nd century AD Pausanias saw monuments which can be related to the site as known today, particularly the Lion Gate itself and the tholos tomb which he called the "Treasury of Atreus".

Though well known by name, the site is not correctly positioned on maps until the late 18th century and the Lion Gate is not mentioned after Pausanias until a Venetian document of 1700. Some damage was done to two tholos tombs (those known as the Treasury of Atreus and the Tomb of Clytemnestra) by Veli Pasha in the early 19th century and both Lord Elgin and Lord Sligo brought back pieces of the facade of the Treasury of Atreus which are now in the British Museum. The lion sculpture over the main gate was luckily considered too heavy to move. During the 19th century the site was frequently visited and was illustrated mainly in watercolour by many travellers, but it has appeared in literature, either Greek or other European, less frequently. Sartre's terrifying *Les Mouches* is once again set in Argos. A notable exception is Sacheverell Sitwell's *Agamemnon's Tomb*, reflecting an aspect little felt by the modern tourist.

Mycenaeans

“Mycenaeans” is the term applied both to the inhabitants of Mycenae itself and to the inhabitants of the whole of southern and central Greece (as far as Mount Olympus) in the Late Bronze Age (1600–1050 BC). The term was also originally used by Sir Arthur Evans for the inhabitants of Crete at a similar date before, in 1905, he put forward the new term “Minoan”.

It is now known for certain, since the decipherment in 1952 by Michael Ventris of their written language in the Linear B script, that the Mycenaeans were Greeks. It is still a matter for debate when this Indo-European people entered Greece or if the language developed in situ from the original core. A common interpretation of the evidence postulates that they can be identified as immigrants from northwest Anatolia whose different, rather inhibited, culture can be widely seen in the closing years of the 3rd millennium BC.

By about 1600 BC a warrior elite had come to power at a number of centres, notably in Messenia and at Mycenae. The growth of wealth among this group can clearly be traced in the finds from Grave Circle B at Mycenae, followed by those of Grave Circle A. The presence in the 15th century BC of single tholos tombs at various sites suggests the model of Early State Modules which become linked through vassaldom, intermarriage, etc. This structure can still be seen in the Homeric poems, especially the Catalogue of Ships, which appear to reflect Bronze Age conditions with adjustments for later political factors.

The simple basic culture of the late Early Bronze Age and the Middle Bronze Age developed with the access of wealth and under Cretan artistic inspiration (and possibly actual craftsmen). However, it retained its separate identity and is notable for the stylization of natural motifs into symmetrical often heraldic patterns and for the portrayal of warfare with only the rarest representations of the actual rulers in any guise.

Between 1400 and 1200 BC the influence of the Mycenaeans grew throughout the Mediterranean. They had contact, presumably from trade, with an area stretching from Sardinia in the west to the Levant coast in the east and to the north into Albania and Macedonia. Sporadic Mycenaean imports are also found in Egypt. Current research is investigating the degree of acculturation which resulted in the various regions with which they had contact. The growth of power and influence caused the culture to become more centralized and an

elaborate bureaucracy is attested in the Linear B documents. Artefact production seems, from what has been preserved, to have changed from elite specialities to bulk manufacture.

The second half of the 14th century and the 13th century formed the acme of Mycenaean influence. The term *Ahhiyawa*, as used in Hittite texts, seems to refer to the Mycenaeans during this period; the ruler is on one occasion referred to as “Great King”, a term usually employed for the ruler of Egypt and other major contemporary states.

At the end of the 13th century BC a series of disasters, possibly the result of earthquake or climatic instability, caused the collapse of the centralized bureaucracy. Though the period called Mycenaean continued until the mid-11th century BC, the artistic and cultural activity of the various regions of Greece is more diverse and there is no further evidence of literacy. By the point at which the hallmark stirrup jar is no longer produced, the Mycenaeans can be considered to have given way to the more obviously direct ancestors of the Classical Greeks.

The later Greeks were well aware of their ancestors of the Mycenaean period, though the term “Mycenaeans” is never used to refer to them. In Homer the adjective applies only to the people of the city itself. It was once thought that this awareness was not the result of cultural continuum from the Bronze Age but resulted from the rediscovery of tombs of Bronze Age date, often assigned to heroes, and from an interest in the past revived by the epics of Homer. Archaeology has now shown this not to be the case; for instance the “heroic” burial at Lefkandi in Euboea dates to the 10th century BC but is of Homeric type. The influence of this legacy on the development of myth and of legends associated with local heroes is much discussed. Homer is now thought to reflect a mainland oral tradition. The cumulative result is seen in all the surviving works of ancient authors, from Hesiod to Pausanias. The respect accorded to heroic ancestors, whether genuine or invented, is epitomized by such events as the diversion of Alexander to make offerings at the supposed tomb of Achilles in the Troad.

Mysticism

The term "mysticism" is a neologism. It is, in fact, characteristic of the Greeks not to have invented a separate, abstract, term for the kind of experience they deemed inseparable from true philosophy and theology. What we do have in Greek are terms for "mystery", "mystic", and "mystical", deriving from the verb *muein*, to close the eye, to initiate into the mysteries. These terms denote that which is hidden, that which lies beyond the realm of ordinary existence. In this essay we shall take a broad definition of mysticism: the quest for, and experience of, unmediated contact with the divine.

Alongside the anthropomorphic polytheism of Greek religion there was an alternative form of religion represented by the mystery cults. These offered a direct apprehension of the divine unattainable within the civil religion. Of these cults the Eleusinian and Dionysian mysteries are of particular importance. The origins of the Eleusinian mysteries are pre-Hellenic. They consisted in the re-enactment of the myth of Demeter, the earth-mother, and her daughter Kore, or Persephone. They involved several stages of initiation, producing fellowship with the goddesses and culminating with the beholding (*epopteia*) of the revelation of these deities at the shrine of Eleusis. The Dionysian mysteries went beyond the Eleusinian in seeking actual possession by and union with the deity. This was to be attained through rites of an orgiastic character in an outgoing of consciousness, or ecstasy. Both cults were associated with the triumph over death and the rebirth into immortality. The myth of the death and rebirth of Dionysus became a prominent feature of the Orphic movement, active from the 6th century BC. The Orphics sought deliverance from the cycle

of transmigration and reincarnation through union with the divine, understood not merely as a transient ecstatic experience but as a permanent state of blessedness.

Plato's philosophy has a profound mystical element. His philosophy was pre-eminently a way, a means whereby man might reacquire true, participatory knowledge of the real, the eternal. The way's end is variously described: it is Being in the *Phaedo*, the Good in the *Republic*, Beauty in the *Symposium* and the *Phaedrus*, and the One in the *Philebus*. Unawakened to the real, eternal world, man perceives only the phenomenal world, the world of sense perception. In his famous cave simile Plato compares the situation of the unawakened to men shackled in a cave, able to see only the shadows of those who pass by behind them. Reawakening to the real world, the noumenal world of ideal Forms, is a painful but necessary experience. From that awakening one must strive for the apprehension of the transcendent reality that is the source of all that is. This way of contemplation and of intuitive, participatory, knowledge is a guiding principle in Plato's work. It is, for example, the way that the rulers of the city state must follow. It was to be an important influence in shaping the Christian mystical tradition.

The mystical way enunciated so clearly by Plato suffuses much of the Hellenic philosophical tradition. Aristotle, notwithstanding the many differences he had with his master, speaks of the contemplative life as a participation in the divine life in which the subject-object distinction between man and the divine disappears. The successors of Plato elaborated the mystical element in his work. The Stoicized form of Platonism known as Middle Platonism, which held sway roughly from the 1st century BC to the 3rd century AD, developed a much clearer idea of the transcendence of God, as opposed to the divine, than that found in Plato himself. It was against this intellectual background that many of the most outstanding examples of Hellenic mysticism emerged.

The work of Philo (late 1st century BC–mid-1st century AD) represents a form of Judaism profoundly shaped by the Middle Platonism of his day. Philo presents God as radically unknowable in himself but made known in his powers or operations. This distinction, not original to Philo, was to have a long and eventful history. For Philo, God reveals himself according to man's capacity to apprehend him. To describe this process of revelation, Philo does use the language of the mystery religions, although he was not directly influenced by them. He describes the soul's journey to God as beginning with conversion and the recognition of the createdness of the universe. Through moral purity the soul comes to know itself and to recognize its utter dependence upon God. Knowledge of God is a divine grace, not a

natural capacity. It entails a going out of oneself, a form of ecstasy seen most clearly in the Hebrew prophets. The shining of the light of God within entails the suspension of the faculties, entails “ecstasy and divine possession and madness.” In such a state the soul is “superior to man but less than God.”

The Hermetic movement that developed in Egypt in the first three centuries of the Christian era made some use of the Egyptian religion, and certainly drew upon Judaism, but was profoundly Hellenic in inspiration. The Hermetic texts present a guide to mystical experience, viewed from a variety of stand points. They speak of God as ineffable but knowable by man by virtue of man’s divine nature. The great evil is ignorance; the mystical way consists therefore in the reacquisition of self knowledge, which is knowledge of the divine, and the ascent to the ecstatic vision of God in which man is deified, or rather realizes his own divinity.

The extraordinarily complex and seductive set of traditions known as Gnosticism posed a grave threat to Christianity in the first three centuries of the Christian era. While teachings and practices varied greatly, Gnosticism was essentially an attempt to present Christianity as a mystery religion, analogous to the mysteries of Mithras, Cybele, and Isis that were flourishing at the time. Teaching a radical form of dualism between God and the world, the Gnostics offered an initiatory form of knowledge whereby those who had a divine spark within them might escape from the material world and find salvation. Gnostic dualism found a new expression in the 3rd century AD with the rise of the Manichaean religion.

The finest example of Hellenic mysticism is to be found in the teachings of Plotinus (AD 204–70), founder of the tradition known as Neoplatonism. Plotinus took up the perception of the transcendence of God found in Middle Platonism and developed it into a thoroughgoing statement of divine incomprehensibility. Plotinus’ teaching is centred upon the soul’s ascent to reunion with the One. We know from his biographer, Porphyry, that Plotinus himself experienced mystical union with the One on several occasions. Plotinus teaches a way whereby the obscurities and accretions of the material life might be removed and the return to God accomplished. Plotinus had a far more positive attitude to the material world than did the Gnostics, but is at the same time unequivocal in his understanding that the material is to be left behind on the soul’s journey back to God. The return to the contemplation of God in Plotinus is also the return to oneself. It is a return to the vision of light in which the subject–object distinction between man and God disappears, in which the soul becomes that light, being “raised to Godhood or, better, knowing its Godhood”. Centre coincides with centre: “This is the life of gods and of the

godlike and blessed among men, liberation from the alien matter that besets us here, a life taking no pleasure of the things of the earth, the passing of the alone to the Alone.”

The Christian mystical tradition took up and reshaped many features of the mysticism of the Hellenistic period, being principally indebted to Philo and Plotinus. Indeed, while Philo’s influence on the Jewish tradition was initially minimal, and many of Plotinus’ successors lapsed into theurgy, or magic, it was the Christians who preserved many of the insights of these two great teachers within the context of a living tradition.

Clement of Alexandria integrated much of Philo’s mystical teaching within the Christian tradition, most notably the motif of the divine darkness of Mount Sinai used to express God’s incomprehensibility. Clement went beyond Philo in speaking quite unambiguously of man’s deification. Like Philo, Clement used the language of the pagan mysteries to describe the mysteries of his own faith: “O truly holy mysteries, O light unde-filed. I am led by the torch-bearer to be initiated into heaven and God. Through initiation I become holy; the Lord is my hierophrant and as one-who-leads-by-light [*photogogos*] seals the votary for himself.” We should not forget how attractive this sort of language would have been to the 2nd-century Alexandrine ear.

Origen’s work has a deeply mystical character, something that those familiar only with his *On First Principles* and *Contra Celsum* can be prone to overlook. For Origen the mystical life is a realization of the union with Christ effected at baptism. His *Commentary* and *Homilies* on the Song of Songs develop this theme. Origen takes Proverbs, Ecclesiastes, and the Song of Songs to refer to the three stages of the ascent to God, that is, to the acquisition of the virtues, to the proper understanding of the natural world, and, finally, to enoptic, or inspective, contemplation of God. In this understanding, the goal of the mystical life is union of the spiritual intellect, or *nous*, to God through contemplation. It does not entail ecstasy.

The Alexandrine mystical tradition formed a crucial component of the teaching of the Cappadocian Fathers. This is most evident in St Gregory of Nyssa’s *Life of Moses*. It is also apparent in the works of Evagrius of Pontus and pseudo-Macarius. Evagrius made Origen’s threefold distinction of the spiritual life classic. He also refrains from speaking about ecstasy. Macarius is less reserved, and speaks of the intellect as “utterly suspended and ravished”, carried away by prayer and become one with it. He also follows Clement and Philo in using the phrase “sober drunkenness”, a motif avoided by both Origen and Evagrius.

There was a danger in the Christian usage of the Hellenic mystical tradition that the mystical life would be seen as circular, as an escape

from matter and a return to pre-cosmic unity. This element of circularity is palpable in the teachings of Origen and Evagrius. It was avoided by the Cappadocians and by Macarius in their emphasis on personhood and the integrity of the body. Union with God in these writers has no connotations of reabsorption into the divine. The teachings of pseudo Dionysius the Areopagite, deeply influenced by the Neoplatonism of Plotinus and Proclus, do not adequately avoid the dangers of circularity. While their wonderful evocations of the suprarational and ecstatic apprehension of God in the state of perfect unknowing were to be enormously influential, they lacked the personalistic element so vital to true Christian mysticism.

Mythology

The Greek word *mythologia*, which occurs for the first time in Plato, simply means “storytelling”. But in modern usage “mythology” refers both to the corpus of myths and to its systematic study. Taken in the former sense, Greek mythology consists of a large number of stories about gods, heroes, the nature of the cosmos, and religious practices. According to one well-known classification associated with early 19th century folklorists and students of non-classical legends, including the brothers Jacob and Wilhelm Grimm (cf. H.J. Rose, *Handbook of Greek Mythology*, (1964), ch.1), these stories consist of three main types.

(1) Myths proper, i.e. pre-scientific and imaginative explanations of real or supposed phenomena which appeal to emotion rather than reason. As these phenomena are mostly natural, nature myths are preponderant. The stories are mainly concerned with gods, their birth, their relationship to one another, victories over monsters and rivals, love affairs, special powers, connections with shrines, or rituals. They are often aetiological in purpose, in that they attempt to provide explanations of phenomena which appear wonderful or puzzling. They are concerned with the causes of all manner of things from apparent movement of the heavenly bodies to the shape of a neighbouring hill or the origin of a local custom.

(2) Legends or sagas, i.e. accounts of heroes who were thought of as actually having lived in the distant past and as having taken part in

quasi-historical events, such as battles and adventures, which were generally accepted as actually having happened. Thus the story of the Trojan War, whose origin tradition traced to Paris' abduction of Helen, is thought to reflect a concerted attempt by the Achaeans, a conquering feudal aristocracy, to seize the Black Sea trade at the beginning of the 12th century BC. It seems to have consisted in a blockade of the fort of Ilium, thus interrupting Trojan communication with neighbouring countries, and the issue seems to have been decided by the economic and military exhaustion of the Trojans which led to the subjugation of the cities allied with them and finally to the fall of Ilium itself. Thus the story is based on some kind of memory of the past and, with the exception of the part played by the gods (which really belongs to myth proper), the progress of the war is described in largely realistic terms. It is a human story unfolding in a human environment. With constant repetition through many generations such legends undergo all sorts of mutations – additions (mostly of imaginary and therefore picturesque material), omissions (mostly of real details), modifications, and rehandlings. Occasionally, the story may be completely fictional, but it will nevertheless be modelled upon real semi-historical narratives. On the other hand, there are instances of fragments of real history being preserved in legends of the peasantry over an extraordinary length of time.

(3) Folk tales told for popular entertainment, mostly stories of adventure dealing with natural or supernatural matters. Varieties include fairy tales, animal fables, and stories about witches, giants, ogres, and magical objects. Despite these supernatural elements, the main character is generally a human being, usually of humble origin, striving to achieve a human goal in spite of, or with the help of, such fantastic forces. The theme may also be a contest or trial, e.g. to defeat a monster or win a bride; or it may involve a more domestic challenge such as circumventing a malicious stepmother or jealous brothers or sisters. Many of these characteristically involve trickery or ingenuity or the use of magic. There may also be an element of wish fulfilment or the acquisition of a treasure or a great reward for apparently small but often highly moral actions, such as the solving of a riddle. A story, such as that of Cadmus, Perseus, Heracles, or the Argonauts, may contain elements from more than one of these types.

The ancient Greeks themselves had various attitudes to their myths. Some people no doubt accepted them as literally true and considered their narratives to be historical accounts. However, many thoughtful people must have found it difficult to accept them or their implications. Their reaction was broadly twofold: rationalization, which appears to have begun with Hecataeus of Miletus (550–480 BC); and allegorization, which probably began with Theaganes of Rhegium

in the 6th century BC and, through its use by the Stoics, persisted until late antiquity and survives in the work of some early Christian writers and artists.

Myths performed a number of important functions in ancient Greek society in the various spheres in which they were employed. Turned into epic, they served to preserve and immortalize the famous deeds of men (*klea andron*). They provided education (often intertwined with entertainment) as examples or allegories. They gave pleasure and aroused feelings which, in some cases such as tragedy (if one follows the interpretation of *katharsis* as purgation) may have been considered therapeutic. Myths were also employed, especially in rhetoric, to explain the present in terms of the past, and to justify political or military decisions.

Greek mythology probably originated from the primitive forms of worship which existed in ancient Crete from about 3000 BC, and which were associated with animistic and magical beliefs. Over time such beliefs evolved into a body of legends involving natural objects, animals, and the anthropomorphic gods, and some of these legends found their way into the corpus of Greek myth. It may be observed that many of the principal Greek myths are connected with centres of Minoan and Mycenaean civilization. The legends of Perseus and Atreus are associated with Mycenae itself, while that of Oedipus is associated with Thebes, and that of Heracles with Thebes and Tiryns. It is therefore possible that these myths existed in some form in Mycenaean times.

Clay tablets from the time of the Mycenaean civilization (which reached its peak between 1400 BC and 1200 BC) provide earliest records of Greek mythology, and suggest that some of the main Greek gods and goddesses were known in the late Bronze Age. According to them, Poseidon was the principal god of the Mycenaeans, while Zeus held a less important place. The presence of the formulae "mother of the gods" and "Drimius, son of Zeus" suggests a divine genealogy. During the so-called Dark Age this mythology combined with that of the Dorians to form the mythology of Classical Greece.

The variety of factors that contributed to the formation of Greek myths and mythological personages resulted in the lack of unity, consistency, or coherence that pervades Greek mythology. The immense diversity stems partly from geographical considerations, since in widely differing regions there evolved different conceptions of the gods of the Greek world and varying rituals of propitiation. Moreover, the myths are often found in fragmentary form and in sources ranging in date from the 2nd millennium BC to beginning of the Christian era, and it is important to realize that the older sources do not necessarily preserve earlier or more authentic traditions. In many

cases the myths and fragments belong to large mythological cycles current in various communities and often not known to us in their entirety. Moreover, the myths contain elements originating in a varied historical and cultural background. In particular, the Mediterranean peoples, who worshipped an earth goddess, were conquered by successive waves of Hellenes bringing with them some form of tribal sky god. Thus, while gods like Zeus represent mainly the Indo-European cultural element, Demeter, Aphrodite, and Rhea probably represent Minoan-Mycenaean and Near Eastern elements. In fact, many deities, such as Demeter, Athene, and Zeus himself, combined in a single divinity both Mediterranean and Hellenic traits. Moreover, the myths have been subject to interpretation by poets and philosophers who have utilized many strands and varied traditions of the mythological cycles. The diversity of local legends may serve to explain the frequent sexual alliances of gods and heroes with their close relations, an idea repugnant to Greek custom. This may be the result of blending together of different legends representing a god and goddess (such as Zeus and Hera) either as husband and wife, or as brother and sister.

Greek myths are nevertheless relatively free of cloudy, grotesque, and horrible details such as are found in the legends of many other nations. Even their monsters are not particularly ugly or uncouth; nor is there much that is dreadful in their witches, ghosts, and demons.

Present knowledge of Greek myths rests principally on ancient Greek literature. The earliest surviving literary sources are the poems of Homer and Hesiod. The *Iliad* and the *Odyssey* focus on events surrounding the Trojan War, but involve the activities of the gods and refer to earlier legends such as the Theban cycle, the voyage of the Argo, and the exploits of Heracles. Hesiod narrates the birth of the cosmos, the succession of divine rulers, the ages of human existence, the origin of mankind's sufferings, and the source of sacrificial practices. Other sources of myths are the Homeric hymns, fragments of the cyclic poets, lyric poets (especially Pindar), the tragedians and comedians, Hellenistic poets and scholars, and writers under the Roman empire such as Plutarch and Pausanias. To these must be added various representations in the visual arts, among which temple friezes and vase paintings are of special importance.

Greek religion was not based on revelation and, with few exceptions (mostly associated with mysteries) did not involve spiritual teaching; and, although state officials in charge of religious matters are not unknown, there were no formal structures and no written codes embodied in a sacred book. There was, therefore, a great variety of beliefs and practices, and a resulting multitude of variations in the myths. The Greek myths embrace most of the themes commonly found

in the mythologies of the world such as creation and origins (aetiological myths), birth of gods and other divine beings, death and the afterlife (eschatological myths), and the renewal and rebirth of the world.

Greek myths show certain characteristic features. They embody an anthropomorphic and non-fantastic view of the gods: the gods are depicted in human form and have human feelings. Strange and scandalous details, which have survived in locally established traditions, are usually suppressed in Homer and other archaic poets. The gods lived on Mount Olympus in Thessaly, in a society that ranked them in terms of authority and powers. They moved freely, however, and individual gods came to be associated with the three principal domains – the sky, the sea, and the underworld – while the earth was held in common. They were immortal, and controlled all aspects of nature. Human lives were totally dependent on their goodwill. Relations between men and gods were generally friendly; but the gods severely punished mortals whose behaviour was unacceptable to them. Excessive arrogance, ambition, or even extreme prosperity provoked divine wrath and punishment. Consequently, there emerged the idea of a dual motivation according to which human destiny came to be viewed as the outcome of joint action by men and gods. Hence the *Odyssey* attributes the destruction of both Odysseus' crew and Penelope's suitors to their own folly and the action of divine justice. Similarly, the Sophoclean Oedipus, while attributing his blinding to Apollo, nevertheless says that it was his own hand that did it (*Oedipus Tyrannus*, 1329–31]. Since the Greek gods were largely personifications of natural phenomena, Greek mythology emphasized human weakness in facing the awesome powers of nature.

Most, if not all, heroes of Greek legends were mortal. They were subject to birth, old age, and death. Nevertheless, they associated with the gods, and many of them claimed their descent from the gods. The majority of Greek heroes and heroines belong to one of two principal groups, namely those who lived before the Trojan War (such as Jason, Theseus, and Oedipus) and those who fought in that war (such as Hector, Achilles, and Odysseus). Some of the heroic tales, such as those of Helen and Achilles, appear to go back to Indo-European times, while others, such as that of the cattle-raiding Heracles, may go back even further. Another distinctive feature of Greek mythology is the prominence of initiatory myths. It has been pointed out that early accounts of pan-Hellenic expeditions contain many elements of male initiation, while legends of heroines reflect the final transition into womanhood.

As scholars such as Peter Walcot (1966) and Martin West (1971)

have demonstrated, Greek mythology is also heavily indebted to the rich mythologies of Anatolia and Mesopotamia, probably through contacts during the Early Iron Age. In his *Theogony* Hesiod has incorporated some violent myths of Hurrian origin concerning, among other things, the cannibalism of the gods which, at a later date, evinced the protests of Pindar: "It is not for me to call one of the blessed gods a cannibal: this I avoid." The castration of Uranus by his son Cronus derives ultimately from the Hurrians through Hittite and Phoenician intermediaries; the division of the universe by lot between Zeus, Poseidon, and Hades (*Iliad*, 15. 187–93) derives from the Akkadian epic *Atrahasis*; and the figures of Oceanus and Tethys (*Iliad*, 14. 201) derive from Apsu and Tiamat in the Babylonian creation epic *Enuma Elish*. The last great wave of mythological invention was the result of Greek colonization of the Mediterranean and the Black Sea during the 8th and 7th centuries BC. Not only the *nostoi* but also the much older voyage of the Argonauts enabled newly founded colonies to relate themselves to the pan-Hellenic past as reflected in these myths and legends. Dynasties and heroic feats were among the more favoured themes of Archaic legend; but with the evolution of a more organized society, family relations received greater attention. Stress within the family leads to lies, betrayal, counter-seduction, and other forms of inhuman revenge – situations which Aristotle advised the poet to seize upon – but occasionally the family acts together to repel stresses from outside. The implicit drama of family stress is not confined to semi-realistic legends such as those of the houses of Labdacus and Atreus, but is also exemplified in the myths of the gods. Moreover, Athenian tragedy, in particular, concentrated more on the role of the individual in relation to the city-state and the value of democratic institutions. A large number of the stories belong to the category of aetiological myths, i.e. they originated as explanations of the birth or function of natural phenomena or religious rituals. In the latter case, it often happens that the myth survives in a detached form even after the ritual has disappeared. Many such myths are recorded by Pausanias (2nd century AD). Closely related are the myths of metamorphoses which, though found as early as Homer (e.g. Niobe and Proteus), came into their own in the Hellenistic age. The Hellenistic versions are aetiological in that they explain a present creature or landmark, though they lack the moral symbolism and the correspondence of animal and human traits characteristic of Ovid's narrative.

The commonest themes of Greek myth emphasize such preoccupations as contests and quests, particularly involving monsters; the relations between men and gods, whether of love, protection, or oppression; and the already mentioned stresses within the family,

leading to acts of vengeance and displacement. Other themes emphasize fertility (though it did not find in Greece many different forms of mythical, as distinct from ritual, expression) and the displacement of elders. Eschatological myths include narratives of the imaginary world of the dead: how gods or defunct mortals pass beneath the earth, what they see on their way, the geography of the underworld and the aspect of its rulers and their subjects, the sufferings caused to the dead by neglect of their funerary rituals on earth, and so on. The developed and detailed eschatology is reflected not only in Near Eastern-type stories of disappearing gods, but also in the theme of heroic *katabasis*, or descent into Hades, e.g. that experienced by Heracles, Theseus, Orpheus, and Odysseus. The so-called Orphic tablets of the late 4th century BC instruct the dead about the topography of Hades, the springs of remembering and forgetting, and what the soul must say to prove its purity. Similar Orphic beliefs are also attested by Plato. Herodotus, probably rightly, traces such eschatological myths and rites to Egypt, but Mesopotamian influence cannot be ruled out (cf. G. S. Kirk, 1970, pp. 260–61).

Although the collection and interpretation of myths as a serious discipline did not begin until the latter part of the 18th century, ancient Greeks were not without thinkers and writers who reflected critically on their myths and expounded them. The first Greek physicist, Thales of Miletus (6th century BC), is represented as adopting a critical attitude towards the myths. By maintaining that the earth floats on water and that things come from water and go back to water, he attempted to correct, with the help of foreign myth known to him, what he saw as defects in the mythical cosmology of the Greeks. Criticism of the myths thus constituted a search for a rational understanding and control of the world. Myths lend themselves to change and adaptation to altered historical circumstances, and in ancient Greece the process continued down to the time when the claims of truth had to satisfy the new requirements of an emerging rationalism. Xenophanes attacked the anthropomorphic depiction of the gods in the myths, and this attack took on a moral dimension with him as well as with Pindar, Euripides, and Plato, on the grounds that the gods were depicted as immoral, adulterous, vengeful, and generally inferior to human beings. Allegorical interpretations (both physical and moral/psychological) were basically reactions to these attacks.

Herodotus (2. 53) believed that many Greek rituals were inherited from the Egyptians, and that the systematization of the Greek pantheon was due to Homer and Hesiod, who gave the deities their titles and distinguished their several provinces and special powers. Before that, the Pelasgians, on all occasions of sacrifice, called upon

“the gods”, but gave neither title nor name to any of them. Thus, according to Herodotus, and in the words of J. Harrison the mythology (or theology) of the Greeks “was not in the main the simple outcome of popular faith; still less was it a compilation due to a priesthood; it was the work of the poets”. Prodicus of Ceos taught that the gods were personifications of natural phenomena. Plato employed myths and mythical modes to provide an insight into the deeper truths of philosophy not accessible to dialectical reasoning (cf. especially the *Symposium*). Although Aristotle is known to have been critical of the myths as fanciful and failing to embody truth about human life and the world, he realized their value in producing the tragic effect and, in his *Poetics*, advised would-be poets to keep as far as possible to the traditional stories. In the 4th century BC the mythographer Euhemerus in his *Sacred History* gave expression to the widely accepted belief of his time that myths were nothing other than distorted history, and that the gods were in effect kings and heroes who had been glorified over time and were worshipped for their deeds. Thus Zeus was an ancient king of Crete who rebelled against his father Cronus, the former king, and overthrew him. Biographies of other gods were similarly provided. Against this it has been argued that, to make a dead man into a god, one must already believe in some sort of gods, so that this theory cannot serve as an explanation of the origin of either religion or mythology.

During the Hellenistic period Greek beliefs were gradually modified under the influence of new philosophies (such as Stoicism) and the influence of neighbouring civilizations, but the myths recorded and adapted by Callimachus and his contemporaries were not directed at the general public (as were those of the Classical Greek poets), but at a small circle of connoisseurs. The Hellenistic and early imperial period saw a number of collections of myths compiled by scholars in order to elucidate allusions in the Classical authors. Most significant in this respect was the collection of mythological scholia on Homer which circulated as a separate book at least during the first five centuries of the Christian era. There were also collections which concentrated on a single theme, such as the book of star myths compiled by Eratosthenes, and the famous *Bibliotheca* ascribed to Apollodorus which organized the myths according to families. It is chiefly to collections such as these that we owe our knowledge of the lesser-known Greek myths. With the coming of Christianity, the gods of antiquity came to be interpreted either euhemeristically or as inferior demons, while the myths themselves came to be rejected as untrue or were interpreted allegorically as moral or exemplary stories – an approach which persisted until the Renaissance. A striking example is the 3rd-century fresco from the Catacombs of Domitilla in

which the risen Christ is represented as Orpheus returned from Hades. Appropriated thus by Rome, both pagan and Christian, Greek mythology has been repeatedly represented through the ages in the literature, painting, sculpture, drama, dance, and music of the west; and its impact on certain other cultures (e.g. Hindu and Buddhist legends) has now been established, even though the theory of Greece borrowing from India still has its adherents also.

N

Naucratis

City in Egypt

Naucratis, on the east bank of the Canopic branch of the Nile, 84 km southeast of Alexandria, was a Greek city in Egypt. It was the birthplace of Athenaeus, and Sappho's brother Charaxas visited the city on business.

Naucratis has been identified with the mounds of Kom Ga'if. Excavations of the site were first carried out in 1884–86 by W.M.F. Petrie and E.A. Gardner, followed by D.G. Hogarth in 1899 and 1903. Since 1977 an excavation and survey by an American team led by W.E. Coulson have been under way. Half the site was destroyed by local people in the 19th century and a lake now covers the area of the old excavations. Modern excavations thus focus on the outskirts of the site and its surrounding territory.

Although both Herodotus (2. 178–9) and Strabo (17. 1. 18) provide lengthy information on Naucratis, many questions relating to the city remain unanswered and subject to dispute. It was initially established as a trading settlement (*emporion*) in about 650 BC, during the reign of the pharaoh Psammetichus I (664–610 BC) and under pharaonic control. Under Amasis (570–526 BC) the Hellenion was built by Ionians from Chios, Teos, Phocaea, and Clazomenae, and by Dorians from Rhodes, Cnidus, Halicarnassus, Phaselis, and Aeolian Mytilene. Aegina, Samos, and Miletus had erected their own temples dedicated to Zeus, Hera, and Apollo (Herodotus, 2. 178–9).

The earliest Greek pottery at the site, about 21 known examples, dates from the last quarter of the 7th century BC and belongs to the transitional and early Corinthian period. There are substantial quantities of middle Corinthian and early Attic black-figure ware, dating from the end of the 7th/early 6th century BC onwards, which probably reflect the extensive scale of Greek activity in Naucratis from the end of the 7th century BC. Nearly all archaic pottery found there accords with information given by Herodotus on the joint establishment of Naucratis by a number of Greek cities: there are ceramics of Rhodian type; Chian and Samian pottery; *fikellura* of Rhodian, Samian, or Milesian production; Clazomenian, Spartan, Corinthian, and Athenian vases; and Aeolian (Lesbian) plain pale grey *bucchero*.

Architectural remains are in very bad condition. Dedicatory inscriptions and offerings to temples help to identify to which gods or

goddesses temples were erected. The temple of Aphrodite, not mentioned by Herodotus, lies in the southern part of the town. Temples to Hera and Apollo stand next to one another, and a small shrine to the Dioscuri (again not mentioned by Herodotus) was excavated in the northern part of the site. In this area of the city a large sanctuary was discovered. Inscriptions on vases unearthed there mention several deities, sometimes just “the gods of the Greeks”, and these dedications give grounds for identifying this sanctuary as the Hellenion mentioned by Herodotus, the joint foundation of several eastern Greek states. Archaeological material from these temples shows that these cults date back to the early days of the settlement, and the temples were rebuilt or replaced several times in different periods.

East of the temple of Aphrodite was a small factory that produced faience scarab seals. It was active mainly in the first half of the 6th century BC. There were also local workshops producing Greek-style pottery (identified by style and technique) for local use as votives. Faience scarabs and figure vases were well known throughout the Greek world. In the 6th and 5th centuries BC there are isolated instances of Greek-manufactured objects directed to specific sites in Egypt. Thus, the inhabitants of Naucratis, not a large settlement, supported themselves by trade and craft work. In the literature, Naucratis is often compared with such commercial outposts of the British empire as Hong Kong or Shanghai.

The exact status of Naucratis is disputed. According to Herodotus and some modern scholars, the settlement was divided into two parts: a polis, inhabited by permanent settlers, and an *emporion* (trading settlement) peopled by Hellenion (visitors). It is possible that when Naucratis was under Persian rule in the 5th–4th centuries BC it was a polis. What little evidence exists (decrees and a tombstone with the ethnic of settlement as part of a personal name) is not very clear. By the Ptolemaic period, immediately after Alexander’s conquest of Egypt, Naucratis did have the status of an autonomous polis. It had its own laws (including a ban on intermarriage), citizenship, and coinage. Graeco-Macedonian rulers recognized the site as a centre of Hellenic culture. With the Macedonian conquest the separate sanctuary area (the northern part of the settlement) lost its importance and was combined with the rest of the city (the southern part of the settlement). The settlement was reformed and adopted the Milesian calendar and laws.

In the Roman period Naucratis retained its Greek constitution; citizens had no right of intermarriage with Egyptians. It had a *boule* (council) and held annual public games. It remained a trade and craft centre throughout the Ptolemaic and Roman periods.

Naupactus

Port on the gulf of Corinth

Naupactus (modern Nafpaktos) is a strategically located port on the northern coast of the gulf of Corinth, just east of its narrowest part. Originally called Locris (Apollodorus, 2. 8. 2–3), it became known as Naupactus (“ship-construction” or “shipyards”) after the Heraclid Temenus built a fleet there (see also Pausanias, 10. 38. 10; Polyaeus, *Stratagems*, 1. 9; Suda s.v. *Naupaktos*). According to Apollodorus, this fleet was later destroyed at Naupactus when one of the Heraclids, Hippotes, killed a prophet whom he mistook for a Peloponnesian. The killing of this prophet apparently angered the gods, who brought doom upon the Heraclid forces and their fleet.

Other myths or legends associated with Naupactus are not extensive. Aeschylus (*Suppliant Women*, 260–70) relates that Apollo’s son Apis, a prophet and healer, came from Naupactus and rid the Argolid of monsters that threatened humans. One tradition also suggests that Ktimenos and Antiphos, Ganyktor’s sons, murdered the poet Hesiod at Naupactus (Pausanias, 9. 31. 6; Plutarch, *De Sollertia Animalium*, 969e), and that Hesiod was buried there (Pausanias, 9. 38. 3). Numerous references exist to an epic poem called the *Naupaktia*, which according to Pausanias (2. 3. 9) described Jason’s life on Corfu after his expulsion from Iolkos. The authorship of the poem was uncertain; though Pausanias (10. 38. 10) reports that by tradition the poem was usually attributed to a Milesian, he believed that the author

was Carcinus of Naupactus.

The strategic importance of Naupactus emerges in the 5th century BC. In the early 450s BC the Athenians, under the command of Tolmides, captured Naupactus from the Ozolian Locrians, who had apparently colonized Naupactus during the first quarter of the 5th century BC. After capturing Naupactus (probably by the mid-450s BC), the Athenians colonized it with some Messenians, who had rebelled against the Spartans, were besieged by them on Mount Ithome, and eventually surrendered. The Spartans, however, at the behest of the Delphic oracle, allowed the Messenians to leave the Peloponnese, after which they were received by the Athenians, who colonized Naupactus with Messenians because of their mutual enmity towards the Spartans. Having an ally at Naupactus would allow the Athenians to put both military and economic pressure on the Spartans' ally, Corinth. With Athens' own port in the east and Naupactus in the west, the Athenians could dominate the Greek seas. (See Thucydides, 1. 103. 1–3, 2. 9. 4; Isocrates, 12. 94 (*Panathenaicus*); Diodorus, 11. 84.6–7, 12. 44.3, 12. 47. 1; Pausanias, 4. 24. 7, 31. 7, 10. 38. 10).

Messenian occupation of Naupactus continued for the next few decades, and when the Peloponnesian War broke out in 431 BC, Messenian hatred of the Spartans and their friendship with Athens allowed the Athenians to use Naupactus as a base of operations against the Spartans and their allies. With Naupactus at their disposal, the Athenian naval presence in the gulf of Corinth could counter the Spartans' allies Corinth to the east, as well as the Spartan-controlled port of Patras. Moreover, thanks to superior naval forces, the Athenians held sway in the gulf of Corinth during the Peloponnesian War. Phormio's victory over the Peloponnesians in 429 BC, despite being outnumbered in ships more than two to one, is still admired for its tactical brilliance (see Thucydides, 2. 69.1, 2. 83; Diodorus, 12. 47. 1–48. 1; Pausanias, 4. 26. 1; Polyaeus, *Stratagems*, 3. 4). By the century's end, though, the Spartans had crushed the Athenians, and between 403 BC and 397 BC they expelled the Messenians from Naupactus (see Xenophon, *Hellenica*, 3. 2. 21–3. 1; Diodorus, 14. 34. 2; Pausanias, 4. 26. 2; 10. 38. 10).

After the expulsion of the Messenians, Naupactus came under Locrian control. Between 395 BC and 389 BC the Locrians were again supplanted by the Achaeans, who held Naupactus until 366 BC when Epaminondas drove them out. After this, Naupactus again became a Locrian possession. How long the Locrians retained Naupactus is not clear, but Demosthenes (9. 34) indicates that in 342 BC the Achaeans held the port and this continued until 338 BC when Philip II of Macedonia seized it and handed it over to the Aetolians.

Naupactus resurfaces in 217 BC as the site of a conference between

Philip V of Macedonia and the Aetolians and Achaeans, a meeting that resulted in a peace accord between the two sides (Polybius, 5. 102–103). Livy reports that Roman commanders made use of the port in 211 BC and 208 BC, and that the Aetolians used it as a meeting place in 200 BC, 193 BC, and 191 BC. The Romans besieged Naupactus in 191 BC when the Aetolians revolted against the Roman cause. After two months, though, the siege was ended through negotiations (Livy, 36. 35), but the enmity between the Aetolians and Romans ultimately became irrelevant since Greece became a Roman province in 146 BC.

During the later Roman republic and empire, little mention of Naupactus exists other than the Caesarian Calvisius' expulsion of a Pompeian garrison there in 48 BC. In the 2nd century AD Pausanias (10. 38. 6–7) describes a few shrines and sanctuaries dedicated to Poseidon, Artemis, Aphrodite, and Asclepius, the last of which was in ruins in Pausanias' day and of which a few remains are extant.

Nauplia

City in the Peloponnese

Nauplia (modern Navplion, medieval Anapli or Napoli di Romania), an important and picturesque harbour town of about 12,000 people, is situated on the Argolic Gulf in the Argolid region of the northeast Peloponnese. It lies beside the sea at the base of two summits: Akronavplia (or the Its Kale), a relatively low but precipitous promontory of c.84m, and the Palamidi, a rocky peak of some 215m on which stands an imposing fortress. The town is now best known as a cultural and tourist centre, but it has had a long and illustrious, if sometimes very troubled, history.

Tradition associates Nauplia both with the mythical Nauplius, son of Poseidon, and with Nauplius the Argonaut who avenged himself on the Greek participants in the Trojan War after they betrayed and

killed his son, Palamedes. Settlement at the site may be traced as far back as the palaeolithic period, with remains from that date and from neolithic times found on Akronavplia. During the Bronze Age the main centre of habitation seems to have been the Pronoia area to the east of the old town; Mycenaean chamber tombs have also been found nearby. The settlement continued to exist in the Dark Age and a cemetery of the Geometric period has been excavated. Traces of occupation continue until the Hellenistic period, but evidence is rather limited. Indeed, historical accounts mention that Nauplia was destroyed by its neighbours, the Argives, during the reign of king Damocratidas (no later than c.600 BC), after which the town became the harbour of Argos (as it may have been in Mycenaean times). By the Roman period the site was deserted since Pausanias, who visited it in the 2nd century AD, reports only a sanctuary of Poseidon there; even the fortress walls were in ruins by his day.

Navy

Greece has a mainland coastline of about 16,600 km together with over 4000 islands, islets, and rocks. It occupies an important geostrategic position in the eastern Mediterranean and merchant shipping has become a significant element of the national economy. Not surprisingly, Greece has a long naval history and maritime tradition, and it is to its naval fighting abilities “that Greece owes its existence – an existence whose character was formulated and strengthened by the sea” (Alexandris, 1987, p. 92).

The development and employment of maritime power was a vital characteristic of Greece’s ancient history. In the 2nd millennium BC the Minoan empire in Crete emerged as the first organized naval power in the world. Later, during the 5th century BC, the success of Athens and the “golden age” of Pericles depended on the systematic development of sea power. Though the first Persian invasion of Greece by Darius in 490 BC was defeated by the Athenian army at Marathon, the Athenian politician Themistocles was quick to recognize that, in any future

attack, land forces alone would not be enough in the face of the vast numerical superiority of the Persian army. Using new-found revenues from the state silver mines at Laurium, the Athenians decided to build a large fleet. The principal fighting element of the new fleet, and a significant Athenian technological innovation, was the trireme – the fastest warship of its time, which could ram and sink enemy ships without exposing itself to the risk of grappling and boarding its opponents.

Themistocles' rationale for developing a naval capability was subsequently vindicated. During 480 BC the Persians, under the generalship of Xerxes, attacked northern Greece with land forces and a fleet of over 500 ships. The invading army destroyed an outnumbered Spartan force at Thermopylae and then engaged in an indecisive naval battle with a Greek fleet off Artemisium. At the subsequent Battle of Salamis, the Persian and Greek fleets were evenly matched in numerical terms, but the edge provided, *inter alia*, by the triremes enabled the Greeks to win a decisive victory. The Battle of Salamis conclusively demonstrated the ability of Athens to wage war from the sea and it was an essential precursor to its wealth and dominion.

Naxos

Island in the Cyclades

At 428 sq km in area, Naxos is the largest island of the Cyclades. It is also the most fertile, being provided with a large coastal plain to the

southwest. The interior of the island is mountainous, the highest peak being Mount Zas, which takes its name from the father of the gods; an inscription on the mountain reads “Mountain of Zeus Milesios”. The cave of Zas on this mountain is said to be the place where Zeus and Dionysus were reared, and Naxos is said to have been called both “Zia” and “Dionysia” in ancient times. Dionysus is especially associated with Naxos, where he was said to have taken Ariadne from Theseus. Fittingly, Naxos was known for its viticulture in ancient times and continues to produce wine to the present day. Other produce, such as grain, figs, olives, and citrus, is also abundant and it is not surprising that Naxos has been renowned for its prosperity.

Naxos is also rich in marble, as well as the emery used to work it. It is the sole source of emery in the Cyclades, and its white marble is plentiful but coarser than Parian marble. Naxian sculptors are first in evidence in the early Cycladic period, when they produced fine vessels and the stylized figures with triangular heads that are unique to the Cycladic culture. Many have been found in the area of Grotta, near the site of modern Naxos city, which appears to have been inhabited almost continuously over the past 5000 years. The later Bronze Age was less productive, but at the beginning of the Archaic period in the late 7th century BC Naxos was at the forefront of Greek marble sculpture production. Indeed, it has as good a claim as anywhere in Greece to be the birthplace of the Archaic style of monumental statuary. The nearby island of Delos received many statues from Naxos, including the female figure dedicated by Nikandre, which is the earliest surviving complete marble statue of monumental size, the Naxian sphinx, and a colossal *kouros*, which was famous in ancient times but is now lost. *Kouroi* were youthful male figures, pictured naked with one foot advanced, and often associated with Apollo. They are the most abundant Naxian work, including several unfinished sculptures remaining in Naxian quarries. A 10m-long unfinished colossus is locally believed to represent Apollo, but has a wedge left by the chin that could represent a beard, in which case it would be disqualified as a *kouros*. The entire area of the quarry is, in fact, associated with Apollo, including the nearby village of Apollo-nia. A large marble temple, variously attributed to Apollo and Dionysus, was erected on a small island outside Naxos city. It is said to have been commissioned by the tyrant Lygdamis. Today only a pair of doorposts and a lintel remain as a landmark. By the time that sculpture passed into the severe Classical style in the late 6th century BC, Naxian marble had faded from prominence. The reasons for this decline, and for the unfinished statues, are unknown.

Lygdamis had risen to power in Naxos in the middle of the 6th century BC, and carved himself an empire in the surrounding islands

with the help of Pisistratus, tyrant of Athens, to whom he had given aid at the time of his exile and restoration. By 528 BC the Naxian tyranny had weakened, and the deposed oligarchs were recalled. Interestingly, among the few records of these events, there is mention of unfinished statues to be returned to them. Twelve years later, according to Diodorus, the Naxians controlled a thalassocracy, which lasted a decade. Coinage was becoming widespread in the Aegean at this time, and Naxian influence on the silver trade may have led to the story that coinage was invented on Naxos. In 499 BC the island was conquered by the Persians. The Naxians helped to expel the Persians in the last stages of the war, but did not fully regain their former power. They joined the Delian League, then later resigned from it. Athenian influence was succeeded by Spartan after the Peloponnesian War, although Naxos was the site of a major Athenian victory in 376

BC.

Necromancy

Belief in necromancy, the employment of the spirits of the dead in divinatory or magical techniques, is attested from almost all periods of the Greek tradition; while treated with disapproval or scepticism by some, and at times subject to harsh legal sanctions, its existence and validity appear, nevertheless, to have been widely accepted on a popular level. It forms only one part of a much wider range of belief and practice concerning the dead within this tradition, however, and also contains elements drawn over time from neighbouring cultures, such as Judaism.

Although the idea of necromancy almost certainly goes back to prehistoric times, the first evidence for it in the Greek literary tradition is found in the *Odyssey* of Homer (10. 501–11) where an elaborate sacrificial ritual for summoning the spirits of the dead is

described by Circe and then carried out by Odysseus and his men. A number of references to it in writings of the Classical period suggest a general attitude of intellectual scepticism but popular belief (see, for example, Aeschylus' *Persae*, 609–842, Aristophanes' *Birds*, 1553ff., and Plato's *Laws*, 10. 909b; cf. 11. 933a–e). Herodotus (5. 92) recounts how the Corinthian tyrant Periander sought the help of the oracle of the dead on the river Acheron in Thesprotia and, much later, Plutarch (*Consolatio ad Apollonium*, 109b–d) also refers to such a cult (*psychomanteion*); in the latter case, at least, the ritual concluded in an incubation, with the spirits appearing and revealing in a dream vision the information being sought. Evidence that necromancy continued to find a place in the Greek tradition during the Roman imperial period may also be found, for example, in such works as Lucian's satirical *Menippus* (or *Nekyomanteia*), written in the 2nd century AD, and Heliodorus' *Aethiopica* (6. 14–15), written in the 3rd; both describe necromantic practices in some detail and at least provide evidence of popular views on the subject, if not necessarily of their own belief in its efficacy or acceptability. The information they give is paralleled by contemporary treatments of the subject in a number of Latin authors, while the Romans legislated severely against necromancy and various references show that the allegation of involvement with it could form a useful and dangerous weapon for attacking political or other opponents.

Apart from information to be obtained from literature, there is also a wealth of material evidence for belief in necromancy from the older Greek tradition, particularly in the form of inscribed curse tablets. These tablets, together with bound figurines and similar objects that belong to related practices, were being placed in graves and at other places where the spirits of the dead might be thought to lurk from at least the 5th century BC, but their use appears to have been most common in the Hellenistic era and does not fade away until the advent of Christianity. Material evidence of ancient necromantic practice also comes from archaeological excavations such as those near Ephyre in Epirus which have uncovered the remains of an elaborate oracle of the dead, evidently conducted in an underground chamber beneath a sanctuary complex; there are many indications (see, for example, the episode recounted by Herodotus) that this area around the river Acheron was that most widely associated in Greek antiquity with necromantic rituals, but it seems that similar oracles existed from time to time at other locations notorious as entrances to the underworld. The oracle of Ephyre, which evidently developed from the 4th century to peak in the 3rd and 2nd centuries BC, appears to demonstrate that necromancy was not confined to individual belief and practice but also played a role in highly organized and officially

sanctioned oracular cults, although some have challenged this view.

Much of the information on necromancy provided by the various literary sources, as well as that derived from the curse tablets, tallies closely with technical material on the subject to be found in surviving manuals of magic. Thus many passages in the Greek magical papyri (2nd century BC to 5th century AD) reveal that the spirits, or perhaps “ghosts” of the dead (the usual term is *nekydaimon*), were believed to act as intermediaries between the magician and the chthonic powers; especially useful were those thought to be trapped in some way between the worlds of the living and the dead, those, for example, who had suffered an untimely or violent death (the *aoroi* or *biaiothanatoi*). Made vulnerable and weak by their marginal status, these souls still possessed the power to bridge the divide between the different levels of existence and so were ideal instruments of the magician in effectuating the aims of a particular procedure, whether this was a curse, a love spell, or a divination. Furthermore, because these spirits fell within the sphere of control normally ascribed to the major deities of the underworld and to others, such as Hecate or Hermes Psychopompus, these greater powers also came to be associated with and invoked in such magical procedures as attempts were made to ensure their compliance. At other times in these sources, however, the notion of the spirits of the dead as mere intermediaries (and often as more or less witless beings) is replaced by one that treats them as malevolent forces in their own right, quite capable of vindictively pursuing the victims of the magician who is manipulating them and, indeed, of turning on their employer if due precautions are not taken. In both cases, however, it is clear that the spirits of the dead were thought to be of crucial importance in empowering many techniques of ancient Greek magic and this undoubtedly explains why, at least in popular belief, magicians were associated with such things as the theft of corpses, ritual murder, and infanticide.

Neoplatonism

“Neoplatonism” is a modern label for the Greek philosophy of the late ancient, early Byzantine period (late 3rd to 7th century AD). The label is inadequate. First, “Neoplatonism” amounted to Greek philosophy in general: it incorporated Aristotelian, Stoic, and Pythagorean tenets (Epicureanism was rejected) and had no other philosophical competitors. Second, there were many diverse, often rival, brands. Third, “Neoplatonism” is very different from the standard Plato, yet shows close links with some renditions of the late Plato and the early Academy. The Neoplatonists fostered allegiance to the Classical past (Neoplatonists wrote most of the commentaries on Aristotle and Plato), but simultaneously promoted a fresh, dynamic philosophy.

Neoplatonism was consolidated and brought into mainstream academic teaching by the Athenian school, and especially Proclus. Its principal founders were Plotinus, Porphyry, and Iamblichus.

The Neoplatonists were primarily philosophers with their own ideas about truth and reality. They reasoned that these come in degrees or levels, each appropriate to the means of knowledge in use. Sense-perception addresses the physical mode of things, reason the conceptual, abstract, or mathematical mode of things, and direct intellectual apprehension the essences, principles, and Forms of true reality. However, all knowledge and being derive from an ultimate principle, the “One”, which by definition is beyond the system.

In descending order, the main metaphysical levels were, the One, Being/Intellect (*ousia/nous*), and Psyche (as self-organizing life/soul/mind). Body and Matter in themselves were considered passive. More detailed orderings made explicit the functions of the One (transcendent – causal, determinative – unlimited), and the structure of Being/Intellect as essence, potency (*dynamis*), and overt actuality (*energeia*).

Neoplatonism is neither just idealism nor realism. Objects are contained in consciousness, and differ according to the mode of awareness and cognition. At the level of pure intellection, being and thought coincide. However, phenomena and reliable conceptions

depend on transpersonal realities, which are self-sufficient.

Psyche in Greek philosophy meant the self-propelled (*auto-kineton*) life that defines living beings. Human psyche consists of a rational (mind) and a non-rational life (self-movement, senses, instincts). With the psyche man can compare sense-perceptions and thoughts, mentally weigh evidence, and arrive at conclusions and understanding (*logos*). Each psyche, however, has only a “particular” perspective. Because of this combination of self-motivation and limited vision, which is its individuality, it “dares” to leave its level, and invariably “fall” into body. Yet, psyche is an extension of atemporal, unlimited, objective principles. To these it yearns to “ascend” by the Neoplatonic routes of love, contemplation, and faith.

From their readings the late Greek philosophers concluded that Plato was nearest to a complete account, provided his writings were interpreted correctly. Aristotle, Plato’s rival, was valid for the domain of sense-experience, ordinary language, and basic logic. Neoplatonic education, as taught at Athens and Alexandria, thus started with Aristotle and progressed to Plato; studying could last six years. Learning stimulates the soul to reflect on its self, and through it on the levels of reality that substantiate it. Salvation comes with the deepening of knowledge, for philosophy aids the soul to recover its full integrity. This is preserved by a unity, which is of divine origin.

Accordingly, Neoplatonists studied an encyclopaedic range of subjects and philosophies, including literary works and criticism, psychology, politics, Pythagoreanism, Stoicism, and Hedonism. First they trained in ethics and logic, i.e. the basics of good living and sound reasoning. Then they learnt physics and mathematics (geometry, arithmetic, astronomy, and harmonics) as the representations of reality. Thinking about being, existence, properties, and causes, and about concepts, knowledge, and truth brought the students nearer to the core concerns. In the final step of “analysis”, they encountered the ultimate foundation of metaphysics, epistemology, and ethics: the unconditioned, ineffable unity, whose traditional appellation is God.

Plotinus (3rd century AD) was born in Hellenized Egypt, and first sought philosophy with the scholastic teachers of Alexandria. Having found them disappointing, he turned to an Ammonius Saccas, who propounded the agreement of Plato with Aristotle. Among his audience were Longinus and the Christian Origen. After 11 years, and a short adventure in the East, Plotinus settled in Rome, where he attracted a large circle of followers, including senators.

For Plotinus, inward contemplation of human nature takes the philosopher on a journey of discovery. Man’s inner capacities reveal universal realities, and exemplify deep philosophical issues. The

relation of body with psyche, for example, shows the difficulty of referencing immaterial existence by the normal material-bound standards. He regarded Plato correct, and Aristotle selectively wrong, especially on the categories of being. Yet, Plotinus' doctrines were not dogmas but the results of lengthy debates with his followers. He was conscious of his unorthodox Platonism: that the Forms are identical with the contents of divine Intellect (interpretation traceable to the 2nd-century Aristotelian professor Alexander of Aphrodisias), and that an aspect of human psyche remains undescended in body. Later Neoplatonists accepted a modified articulation of the former, but rejected the latter.

Plotinus' writings were edited and publicized by Porphyry. Although Porphyry records their chronological order, he arranged them in six thematic groups of nine, henceforth known as the *Enneads*. In this they conform to an ascending scale from ethics and physics, to psyche, *nous*, and finally on to the divine One. This is the hierarchy of virtue, being, and knowledge, which will typify later Neoplatonism and its curriculum.

Porphyry (3rd to early 4th century AD) was born in Hellenized Phoenicia of Syrian parents, and first studied at Athens with the prominent scholastic Longinus. From him he inherited breadth of learning and source material, organized, critical thinking, and clear, concise expression. However, he became more attracted to Plotinus' philosophy. After five years, he disagreed with Plotinus, left him, and pursued his "harmonization" of Aristotle's logic and metaphysics with Plato. Nevertheless, Plotinus entrusted him with the publication of his doctrines. Porphyry disseminated widely their new philosophy with his numerous writings (including a key work on vegetarianism and ecological philosophy) and high scholarly reputation.

For Porphyry, Aristotle is true, within the limits of sense-experience, physical reference, logic, and semantics. Plato addresses the intelligible but intangible reality. In ethics and religion, Porphyry promoted the ideal of the simple living philosopher-priest. He was the first to write on the "Chaldaean Oracles", proverbs written in Greek but of uncertain origin, that later Neoplatonists used as revelatory support for their ideas; he was also the first to elevate faith, love, and truth alike to the divine virtues. Porphyry saw reason as the surest path to God, and rejected Christianity and Gnosticism as irrational or fraudulent. Indeed, the "harmonization" was motivated by his concern to defend Hellenic philosophy.

In the meantime, Plotinus' chief spokesman, Amelius, had also left him and settled in Apamea, Syria. Amelius bravely postulated that the Platonic Forms must be infinite (subsequent Neoplatonists rejected it), and, unlike Porphyry, believed that ritual practices enable contact

with divinity. Further, he introduced a tripartite distinction in *nous*. His first doctrine influenced Theodore of Asine, a student of Iamblichus, but was rejected by other Neoplatonists. The last two show influence from Numenius, a Neopythagorean who flourished at Apamea in the 2nd century AD. He had introduced ideas later typical of Neoplatonism (Plotinus was once accused of plagiarizing Numenius): the Forms as contents of *nous*, threefold divisions, the Pythagorean reading of Plato, theurgy, and the value of revelatory oracles.

The Syrian Iamblichus (4th century) was at first an acolyte of Porphyry, but disagreed over the role of theurgy. After a short stay at Caesarea, he established a school at Apamea, which seems to have offered both philosophy and conventional rhetorical education. Iamblichus' school proved exceptionally popular, only to be surpassed by that of his student Aedesius the Cappadocian, at Pergamum. Their students spread and influenced the Byzantine empire from its very beginning. Iamblichus' student Sopater of Apamea advised the emperor Constantine the Great, and presided over the consecration of Constantinople's foundation in 330. Aedesius, through Maximus of Ephesus, converted the emperor Julian (361–3) from Christianity to a universalist "Hellenism".

Iamblichus took Porphyry's "harmonization" of Aristotle with Plato further into ontology and psychology, and added Neopythagorean number metaphysics. He sought to mathematize all areas of philosophy and religion, because mathematics made possible their scientific study. He analysed the Neoplatonic levels into transcendent and immanent aspects, and, for the first time, he saw time not as a by-product of psychological activity but as substantial reality. He concluded, against Porphyry, that divinity cannot be reached by reason but by an appropriate act of transcendence: supra-rational theurgy. Against Plotinus, he pointed out that embodied souls do not access higher planes, but are fully immanent in matter. Nevertheless, they contain a divine spark which is the source of salvation both of individual souls and of matter.

The Iamblichean version incorporated most of Porphyry and Plotinus, but rejected Theodore of Asine. In a modified form it was eventually accepted by the chief mainstream schools of Athens and Alexandria. Through them the Neoplatonic educational philosophy became the curriculum of Byzantine higher education until the 15th century.

Nero ^{AD} 37–68

Roman emperor

Nero (54–68) had a more complex relationship with Greece than any Roman emperor before or after him. Although other men, such as the Egyptian Amasis (Herodotus, 2. 178) and the Roman general Antony (Plutarch, *Antony*, 23), had been called philhellenes, Nero as Roman emperor had unprecedented power to express his love for Greece on a vast scale. Nero's philhellenism can be divided into two categories: first, there is his own personal pursuit of Greek culture, music, and literature; secondly, there is his adoption of a foreign policy that was beneficial to Greece as a country.

Early signs of Nero's love of Hellenic culture are clear from his enthusiasm for the Greek language: under Claudius, he gave speeches in the senate in Greek on behalf of the Rhodians and the Trojans.

Some critics have suggested that Nero did not write these speeches himself (cf. Tacitus, *Annals*, 13. 3. 3: Nero was “the first ruler to need borrowed eloquence”). That may be so, but his public demonstration of competence in the Greek language certainly contrasts with previous emperors, such as Tiberius, who could speak Greek fluently, but only ever did so in private. Another early sign of his philhellenism can be seen in his staging of Pyrrhic dances by young Greeks in AD 57 (Suetonius, *Nero*, 12. 2). Yet it was not until after the murder of his mother Agrippina that Nero was able to give full and free expression to his personality. In AD 59 Nero himself performed on the cithara at the Juvenalia, where he celebrated the first shaving of his beard (Suetonius, *Nero*, 11.1; Tacitus, *Annals*, 14. 15. 1; Dio, 61. 19. 1). Not only Nero but certain Roman aristocrats also appeared on stage, acting dramatic roles. Yet the Juvenalia took place within the palace grounds in private: it was not until AD 64 that the 27-year-old Nero made his debut on the public stage, at Naples (Tacitus, *Annals*, 15. 33–34 and Suetonius, *Nero*, 20. 2–3). Conspicuously, he avoided Rome for this performance, perhaps anticipating a hostile reaction.

Yet his confidence quickly grew. In AD 60 he had instituted a quinquennial contest along Greek lines called the Neronia, in which participants competed for prizes in oratory, singing, playing the lyre, and poetry (Tacitus, *Annals*, 14. 20. 21; Suetonius, *Nero*, 12. 3; Dio, 61. 21. 2). According to the sources, at the second Neronia in AD 65, despite the senate’s attempts to dissuade the emperor from performing, Nero recited a poem on stage and then accompanied his singing on the lyre (Tacitus, *Annals*, 16. 4. 5; Suetonius, *Nero*, 21; Dio, 62. 29. 1). If these festivals were designed to inspire fellow Romans with a passion for Greek culture, Nero was unsuccessful. Subsequent historical and literary accounts cast the emperor in a tyrannical light, partly because the spectators at his shows were increasingly obliged to become the focus of attention themselves: either they performed on the stage or their reactions to Nero’s display were carefully monitored by imperial agents. Nero’s manipulation of his fellow Romans was too overbearing and superficial, rather as when Peter the Great tried to make his fellow Russians more “western” by getting them to shave off their beards.

When Nero died, the pretence of philhellenism that had gripped Rome perished with him. The new Flavian dynasty bolstered their own power by reversing many of Nero’s policies and ideologies. Thus, Vespasian rejected Nero’s infamous Golden House as an imperial residence, rehabilitated the colossal golden statue of Nero to represent the sun, and refurbished the temple to the Divine Claudius, which Nero had deliberately neglected. The theatrical philhellene Nero had temporarily redefined the imperial identity, but this proved unpopular

with the senate, so the more austere Vespasian wisely took as his role model Augustus rather than Nero. Yet there is evidence that Nero was missed by some. After his death, no fewer than three men appeared, each one falsely claiming to be the emperor. The first surfaced on the island of Cynthus in AD 69 (Tacitus, *Histories*, 2. 8–9), the second in Asia Minor in AD 80 (Dio, 66. 19), and the third among the Parthians in AD 88–89 (Suetonius, *Nero*, 57. 2). Whatever their personal motives, such impostors clearly hoped to win the public approval of those who, long after the emperor's death, “used to lay spring and summer flowers on Nero's grave” (Suetonius, *Nero*, 57). The fact that all three pretenders materialized in the east suggests that Nero's posthumous standing there was much stronger than in the west.

Nero's treatment of Greece itself can be seen as inconsistent. After the fire of Rome in AD 64, the emperor sent agents to Greece to remove treasures (including statues of the gods) from shrines at Athens, Delphi, Olympia, and Thespiae. Pausanias says that Nero “robbed Apollo of five hundred bronze statues, some of gods and some of men” (10. 7. 1). This move may have been necessitated by short-term financial expediency, but it should warn us not to over-romanticize Nero's relationship with Greece. He owes his reputation as a philhellene above all to his liberation of Greece from taxation and Roman administration. This flamboyant emancipation took place at a special celebration of the Isthmian games at Corinth on 28 November AD 67, while Nero was conducting an artistic tour of Greece. By this action he recalled the actions of Titus Flamininus in 196 BC, who had also liberated Greece (Polybius, 18. 46). On a damaged marble stele a version of Nero's speech from this occasion is preserved, together with a decree from Akraiphiai in Boeotia honouring the emperor (*Inscriptiones Latinae Selectae*, edited by Hermann Dessau, 1892, reprinted 1979, no. 8794). Although Nero told his Greek audience that he acted “not out of pity for you but out of goodwill”, there are hints in the speech that his action was not entirely altruistic. Nero also boasted proudly that although other leaders had liberated cities, only he had liberated a province. The competitive emperor seems concerned here, not with promoting the well-being of Greece, but with bolstering his own reputation. At one point Nero even wishes paradoxically that Greece were still at its peak so that more people might enjoy his favour. This, surely, is a revealing formulation, which puts into perspective Nero's reputation as a philhellene, as did the fact that he called his Greek games the Neronia, after himself. The Akraiphiai decree shows that in AD 67 there was gratitude in Greece for the liberation, but this may not reflect universal opinion: as Tacitus says in a different context, “Services are welcome as long as it seems possible to repay them, but when they greatly exceed that point they

produce not gratitude but hatred” (*Annals*, 4. 18). In any case, Nero died so soon afterwards that no consolidation of the grant was possible. After the civil wars of AD 68–69 the new emperor Vespasian complained that Greece had forgotten how to be free and Nero’s gift was swiftly cancelled.

Nero’s benefaction had an immediate impact in the short term, as the Akraiphiai decree shows, but did his treatment of Greece make any long-term difference? In some ways, it was a mixed blessing for Greece to have received such a conspicuous benefaction from this disgraced emperor. Even in the Akraiphiai decree Nero’s name was deliberately erased from the stele after the senate had condemned the dead emperor to oblivion (*damnatio memoriae*). Nero himself was quickly cast in the literary tradition as a yardstick for monstrosity even by Greek writers, as when Philostratus makes Vespasian say that he would rather have Nero come back to life than surrender the empire to Vitellius (*Vita Apollonii*, 32). Even so, despite the backlash against Nero, there are signs that some Romans began to embrace Greek culture. Juvenal (2nd century AD) included in one satire a xenophobic tirade about Rome being infiltrated by Greek habits (*Satires*, 3. 58–125), and under Trajan (AD 98–117) new senators were recruited from Athens and Sparta, which resulted in significant cultural interaction. During the 2nd and 3rd centuries AD there was a period of cultural renaissance in Greece, which became known as the “Second Sophistic”. Some scholars suggest that Nero’s shortlived liberation of Greece even provided the spark that caused this intellectual revival. Nero’s unsubtle attempts to inculcate philhellenism in his fellow Romans certainly failed, but the theatrical liberation of AD 67 still heralded a remarkable new era of literary creativity in Greece.

RHIANNON ASH

Biography

Born in AD 37, Nero succeeded Claudius as emperor in 54. After the death of his mother Agrippina he felt free to indulge in his love of Greece. He himself sang and performed on stage, and he introduced Greek-style games at Rome (called the Neronia). In 66–67 he toured Greece and liberated the province from Roman administration and taxation. The gift was cancelled soon after his death in 68 but it may have helped to pave the way for the Second Sophistic movement of the 2nd and 3rd centuries.

Nicaea

City in northwest Asia Minor

Nicaea (modern Iznik) is strategically located on main highways at the edge of a lake in northwest Asia Minor, a day's journey from Constantinople. A centre of Hellenism in the Hellenistic, Roman, and Byzantine periods, it played a major role in the history of the Christian Church.

Established originally by Antigonus I, Nicaea was refounded around 300 BC by Lysimachus who named it after his wife. From 281 to 74 BC it was one of the centres of the kingdom of Bithynia. Under the Romans, Nicaea controlled a vast territory, and struck an extensive and varied coinage. It was built on a rectangular plan and adorned with numerous public buildings, some of them on an extravagant scale that attracted unfavourable comment from Pliny, who governed the region from AD 110 to 112. Few monuments have survived from these

peaceful centuries. The troubles of the 3rd century, however, produced powerful surviving fortifications that allowed Nicaea to resist all attacks for a thousand years.

Nicaea was an early centre of Christianity (a late tradition has its church founded by St Andrew) and home of several saints and martyrs. In 325 the first Ecumenical Council met there. The emperor Constantine presided over the gathering of 318 bishops who defined orthodox doctrine against the Arians, producing the creed that is still recited. During late antiquity Nicaea flourished as an administrative centre, but suffered from devastating earthquakes and the growth of nearby Constantinople. Several of its buildings were restored by the emperor Justinian in the 6th century.

Nicander

Poet of the (?)2nd century BC

Nicander of Colophon, a Hellenistic poet of disputed date (probably 2nd century BC), wrote at least 20 works, most in dactylic hexameters or elegiac couplets. Like other erudite Hellenistic poets, he also wrote works of a lexicographic and linguistic nature in prose. A “metaphrast”, he converted the prose treatises of earlier writers into epic verse, even when he had no expert knowledge of the subject. Only his *Theriaca* (958 hexameters on poisonous creatures and on antidotes for their bites and stings) and *Alexipharmaca* (630 hexameters on antidotes to poisons) are extant. Among his more influential lost poems are *Georgics* and *Melissourgika* [Bee Keeping], both of which were used by Virgil in his *Georgics*, and *Heteroioumena* [Metamorphoses], which directly or indirectly provided Ovid and Antoninus Liberalis with material for their *Metamorphoses*. Fragments of other poems, for example on geography and local history, are extant, but of many attested works (such as Nicander’s rendering in epic verse of the Hippocratic treatise *Prognostic*) there is almost no trace.

The poem *Theriaca* is probably an adaptation of the prose work *On Wild Animals* by an early 3rd-century BC expert on poisons, Apollodorus. Both *Theriaca* and *Alexipharmaca* also discuss the effects of plants on the human body, and for this Nicander likewise appears to have been indebted to Apollo-dorus, who in turn might have used Diocles of Carystus’ work *Rhizotomikon* [Root-Cutting].

The ostensible aim of *Theriaca* is to help those suffering from the stings and bites of snakes, lizards, tortoises, turtles, frogs, toads, fish, scorpions, spiders, bees, wasps, beetles, moths, and flies. Like other Hellenistic scholar-poets, Nicander in fact strives to amaze his readers with a dazzling display of technical virtuosity in the poetic representation of a recalcitrant, unpoetic subject. Seemingly disparate, incompatible elements – archaic epic diction (including numerous Homeric hapax legomena), bold neologisms, technical zoological terminology, epic verse, botany, medical prescriptions ostensibly addressed to a physician, and learned allusions to earlier poetry (especially to Callimachus) – are skilfully woven into a recondite, affectively rich poem.

Exploiting the tensions between his science and his poetry, between his subject and his presentation thereof, Nicander in *Theriaca* describes the poisonous aggressors and their poisoned victims in such a way as to convey his predecessors' "objective" zoological, botanical, and medical expertise, while also using striking metaphors, similes, and aetiological myths to evoke the physical peril, the aesthetic revulsion, and the fright and terror to which the victims are exposed. The tension between science and poetry, which is also reflected in many lexical, semantic, metrical, and syntactic strains in Nicander's language, is thus cleverly translated into a suggestive tension between the victim as scientific object and as terrorized subject in need of the poet's aid.

Further evidence of the poet's aspiration to display technical virtuosity is the insertion of an "epic" catalogue of 82 plants (*Theriaca*, 837–914) in the concluding section on general remedies – plants whose "clinical" applications are not specified – and the covert integration of an acrostic signature of Nicander's own name (*Theriaca*, 345–53) in a purple passage on the burning thirst caused by the bite of a smallish viper, the dipsas. *Theriaca* ends not only with another reminder of the poet's name and of his birthplace (Clarus, near Colophon), but also with a bold attempt to assimilate Nicander's didactic meta-phrasis to Homeric epic: "And now you should hereafter preserve the memory of Homeric Nicander, too, whom the snow-white town of Clarus nurtured" (*Theriaca*, 957–58).

Nicander's hexametric poem *Alexipharmaca* exhibits many of the same characteristics as his *Theriaca*. After a proem addressed to Protagoras of Cyzicus, it presents 22 substances and entities – animal, vegetable, and mineral – that are fatal or harmful to human beings. Some of the more notorious toxic substances known to antiquity are included: hemlock, aconite, opium, henbane, and blister beetle. In each case, the poet first describes the symptoms produced by the poison, and then the antidotes. The poem ends with a *sphragis*

(authorial “seal”) very similar to the one in *Theriaca*: “And now you should hereafter preserve the memory of Nicander, composer of songs, and guard the law of Zeus, protector of guest-friendships” (*Alexipharmaca*, 629–30). In both extant “seals” Nicander therefore presents a poetic, not a scientific self-understanding (“Homeric Nicander”, “composer of songs”), signalling that his poetic identity is a key to understanding his extant works.

Nicander’s influence on later Greek and Latin literature was considerable. Not only did Virgil, Ovid, and Antoninus Liberalis draw on his works (see above), but Lucan, Pliny the Elder, Erotian, Aelian, and Athenaeus of Naucratis also benefited from direct or indirect familiarity with Nicander. In the 1st century BC the enormously learned scholar Didymus (“Chalcenterus”) appears to have made extensive use of Nicander’s lexicographic contributions. Although Dioscurides only twice cites Nicander’s views in his *Materia Medica* (3. 29, 4. 99), Galen in his pharmacological works quotes a number of verse passages from Nicander. Papyrus fragments from the 1st to 3rd centuries AD further confirm Nicander’s popularity in the Roman empire.

An invaluable corpus of ancient scholia became attached to Nicander’s two extant poems. The extant scholia not only explain many of Nicander’s words, expressions, and references but also report extensively on the views of Hellenistic authors whose works are lost, including three of the six attested ancient commentators on Nicander. Furthermore, the scholia offer rich data on folk traditions, including superstitions concerning spiders, snakes, toads, frogs, wasps, and salamanders.

Extant Greek paraphrases of *Theriaca* and *Alexipharmaca* were composed by Eutecnius some time after the 2nd century AD. They are included in one of the most famous Byzantine scientific manuscripts, the illuminated “Vienna Dioscurides” (Vienna, Österreichische Nationalbibliothek) produced in Constantinople in AD 512–13. Eutecnius’ prose versions here are accompanied by magnificent illustrations of snakes, insects, spiders, scorpions, and other animals. These illustrations also appear in a 10th-century copy of the “Vienna Dioscurides” (now in the Pierpont Morgan Library, New York). In the 10th century a remarkable illuminated manuscript of Nicander’s two poems was produced (Paris, Bibliothèque Nationale, Suppl. gr. 247). It contains images not only of the snakes, scorpions, plants, etc. mentioned by Nicander, but also of human figures displaying the effects of the poisonous substances or illustrating Nicander’s mythological allusions. In the 13th century Maximus Planudes also showed a keen interest in Nicander, producing a manuscript (Florence, Biblioteca Medicea-Laurenziana) that contained both poems.

The scholia, paraphrases, and illustrations are further evidence not

only of the interest that Nicander continued to stir among the later ancient and Byzantine cultural elite but also of their fascination with the amalgam of science, folklore, myth, poetry, and magic that is characteristic of much of the ancient Greek toxicological tradition. This fascination continued to a striking degree in the 16th century, during which many printed editions, several translations into Latin, including one in epic verse, and a verse translation into French were published. A critical appreciation of Nicander's technical virtuosity was widely shared in the early modern period.

HEINRICH VON STADEN

Biography

Born at Clarus near Colophon probably in the 2nd century BC, Nicander wrote at least 20 works, of which two survive: *Theriaca* on poisonous creatures, with remedies against their stings and bites, and *Alexipharmaca* on antidotes to poisons. Both are indebted to Apollodorus. They mix superstition with botany and medicine. Lost works include poems on geography, local history, and medicine.

Nicopolis

City in Epirus

Situated on the isthmus of the Preveza peninsula 6 km north of Preveza, which is itself at the entrance to the Ambracian Gulf opposite Actium, Nicopolis was founded by Octavian on the site of his army encampment during his campaign against Mark Antony in 31 BC. From the outset it operated as an administrative centre serving the cities of northern Epirus. Self-consciously Greek, it never accepted (unlike Corinth) the status of a Roman *colonia*. Its pride in its status is instanced by Epictetus, who lived there at the end of the 1st century AD (*Dissertationes*, 4. 1. 14), and confirmed by its coinage that continued to be minted until the reign of Gallienus (AD 253–68). During its early years, in the reign of Augustus, it had been chosen as the site of the Actian Games, celebrated every four years and given equal status with the major Panhellenic games.

Christianity came early to Nicopolis. Paul asks Titus to come to him there for he “had determined there to winter” (Titus 3: 12) at an unknown date, depending on the chronology of Paul’s last years. There was a well-organized community in the city in the early 3rd century AD, for Origen visited Nicopolis c.220 and found a copy of the scriptures there, which he used as an authority in compiling the *Hexapla* (Eusebius, *Historia Ecclesiastica*, 6. 16. 2). In the 4th century Nicopolis achieved metropolitan status and, as elsewhere in the Hellenic world, Christianity gradually became the predominant religion in the city. Two large basilicas dating from the early 6th century have been discovered and excavated. One, built by bishop Alkison (died c.515) within the city’s walls, measured 68.90 by 31.60m; the other, built by bishop Dunetios, had excellently preserved mosaics. The site of the metropolitan’s palace was found near Alkison’s basilica.

Nonnus

Epic poet of the 5th century AD

Although Nonnus was born in Panopolis, he most probably lived in

Alexandria, and travelled extensively in the eastern part of the empire, particularly Asia Minor and Constantinople. He wrote an epic poem of approximately 25,000 lines with the title *Dionysiaca*. As the title suggests, it is about Dionysus, dealing particularly with the subject of Dionysus in India (books 13–40). There was a fascination with Dionysiac themes in both art and literature in late antiquity and Nonnus was not the first to deal with this topic: Euphoriion and Dinarchus from Delos were his predecessors in the choice of Dionysiac themes in poetry.

His work stands on the borderline between the ancient and the Byzantine worlds. There is an apparent imitation of Homeric forms, although the metrical similarity is strictly technical. The decision to write an epic poem would almost inevitably put an author in competition with the Homeric poems. Nonnus uses Homeric vocabulary, although as a student of Hellenistic poetry he transforms it into more sophisticated usage. He is inspired by Homeric narrative techniques as well as the epic heroic atmosphere, which he tries to recreate in his own work. Passages such as the two proems, the weaving of Aphrodite in book 24, the shield of Dionysus in book 25, the theomachy in book 36, the various extensive catalogues (books 13, 14, and 26), as well as the presentation of the gods bear witness to both a structural and a more substantial inheritance from Homer. Nonnus was also influenced by Hellenistic poetry. There are many parallels with some love epigrams of the *Greek Anthology*. His use of *propemptika* (dirges) and erotic narrative, as well as his erudite concern with aetiological stories and pastoral motifs, place him in the literary tradition of the Alexandrian school. The pastoral mode is only too evident in the episodes of Actaeon and Ampelus, and Hymnus and Nicaea.

The context of the *Dionysiaca* is inspired by Alexander's expedition to India, the "new Dionysus". This gives Nonnus the opportunity to present an accumulation of various legends and fables on the Dionysiac tradition, with the defect of creating a heavily erudite style, as many scholars argue. Such condemnations, however, do not take into consideration the literary tradition that Nonnus had inherited and the transition in the literary tradition that took place at this very time, with the result that even recent scholarship lacks appreciation of late antique poetry. The historical element that is inserted in an epic context reshapes the poetic ideals of the epic. On the other hand, a rigorous rhetorical tradition has been established and plays an important role in contemporary literary products. There is also a significant debate as to whether there are inter-textual allusions to Latin poetry, particularly Ovid and Virgil, which has not yet reached a conclusion. His choice of fusing Dionysian motifs with Alexandrian

legends could be appropriated by the emperors who campaigned in the east, revealing also that literature is not alien to contemporary politics, and has a cultural, historical, and even political context.

A major innovation is Nonnus' choice to make Dionysus the central hero of an epic that clearly is indebted to the Homeric epics, even though Dionysus is almost absent in Homer. There was a rich literary and artistic tradition associated with the figure of Dionysus that Nonnus exploited. Dionysus, the wandering god, who transformed himself from youth to old man and vice versa, enjoyed an immense popularity and proved to be the other side of the coin to the Alexandrian theme. Dionysus had a particular appeal to contemporary ideological tensions, for both pagans and Christians. According to Eusebius, Dionysus played an important role in soteriological hagiography, since he appeared from antiquity as a god offering salvation. John Malalas, a historian of the 6th century AD, argued that Dionysus was a mortal, stating that his tomb could be found at Delphi. Glen Bowersock (in Hopkinson) writes that the parallel between Christ and Dionysus was responsible for producing the semi-theatrical work *Christos Paschon* [Christ Suffering], in which Christ replaces Dionysus in a verse borrowed from Euripides, an identification that lies, according to Eusebius and Malalas, at the heart of the Nonnian epic.

Nonnus is also believed to be the author of a paraphrase in epic hexameters of St John's gospel, with the title *Metabole of John's Holy Gospel*. This is not a simple paraphrase of the gospel, and it renders the personality of Nonnus even more complicated. Some scholars have argued against Nonnian authorship of this work, adducing mostly stylistic arguments. Although the Christian religion had long been established in the Roman empire, the polarities of paganism and Christianity still existed. Some scholars have argued that it is due to Nonnus' conversion to Christianity that the *Dionysiaca* was left unfinished; others say that the domination of pagan motifs was not as unacceptable as we may think for a Christian poet, and place Nonnus' conversion much earlier, if it ever happened.

Biography

Born in Panopolis in Egypt in the first half of the 5th century AD, Nonnus probably lived in Alexandria and travelled widely in the eastern empire. He was the author of an epic poem entitled *Dionysiaca* in 48 books which deals particularly with Dionysus in India. He is also credited with a poetic paraphrase of St John's gospel.

Novel

Five complete lengthy fictional prose narratives (conveniently called “novels” or “romances”) survive from Classical antiquity: *Callirhoe* by Chariton of Aphrodisias (8 books; probably 1st century AD); *Ephesian Story* by Xenophon of Ephesus (5 books; probably pseudonymous; 1st–2nd century AD); *Leucippe and Cleitophon* by Achilles Tatius (8 books; late 2nd century AD); *Daphnis and Chloe* by Longus (4 books; 2nd–3rd century); and *Ethiopian Story* by Heliodorus of Emesa (10 books; 3rd–4th century AD). In addition Photios in the 9th century read and summarized at length two works now lost: *The Wonders beyond Thule* by Antonius Diogenes (24 books; late 2nd century AD) and *Babylonian Story* by Iamblichus (16 books; soon after AD 165). Since the 19th century, our knowledge has been supplemented by the discovery of papyrus fragments of several more lost novels, the most important of which is the so-called *Ninus Romance*, probably of the 1st century BC and thus the earliest known example of the genre.

The extant works form a tightly knit corpus of “ideal” romances, all sharing essentially the same plot: a beautiful and noble couple fall in love and, either before or just after marriage, pass through a number of adventures, generally including separation and extensive and perilous journeys during which they encounter pirates and suffer shipwreck, apparent death, and unwelcome amatory advances from rivals of both sexes, remaining faithful to one another until they are eventually reunited and return home, implicitly to live happily ever after in a state of wedded bliss. The patron gods of the romantic world are Tyche (Chance) and Eros; the role of the protagonists is generally to suffer nobly and lament tragically, rarely to act decisively. Despite the skill that some novelists show in characterization, the interests of the form as a whole are with plot rather than psychology. However, all the individual writers vary the basic formula to some extent, and some of the papyri are radically different in tone and content, indicating that the apparent uniformity of the genre is in fact largely

due to the tastes of Christian Byzantium.

The novel was the last of the literary genres to appear in antiquity, and much scholarly labour has been devoted to the question of its origins. Particularly influential was Erwin Rohde's hypothesis that it arose from a combination of travel stories and Hellenistic erotic narrative poetry. Others have suggested that the novel evolved out of Hellenistic historiography, with its concern for emotional effect, or New Comedy, with which it shares plot elements of amatory intrigue, or obscure local legends, or have sought the roots of the Greek novel in the narrative traditions of Egypt and the Near East. More recently, however, a consensus has emerged that the undoubted similarities and references to earlier literature – particularly the central texts of Homeric epic, and Classical tragedy, rhetoric, and historiography – are less a sign of the genre's origins than of a deliberate self-positioning in the Classical tradition on the part of its exponents.

This bears on the important question of the readership of these early novels. There is very little direct evidence on this point. The novel was neglected by ancient critics, to the extent that there was not even an agreed term for this type of literature before the Byzantine period. The few references to novels and novel-reading are unanimously uncomplimentary. This silence played to the prejudices of 19th-century scholars against romantic fiction, and gave rise to a widely held view that the novel was intended for a mass readership created by the spread of literacy in Hellenistic times, and including such marginal groups as women, young people, and the half-educated. However, as physical objects the novel papyri are indistinguishable in quality from other texts, in no way suggesting a cheap and down-market product, and their numbers remain relatively modest, although we cannot be certain to what extent any given copy may have circulated from reader to reader. Even the simplest of the novels would require a high level of literacy on the part of its readers, and the intertextual play of most of them implies an audience intimately familiar with a wide range of literature. In other words, it looks as if the people who bought and read novels were more or less those who read the rest of Greek literature.

This conclusion in its turn implies that the novel as a genre emerged to supply a market demand for pleasurable reading among the educated urban elite of the Greek east in the Hellenistic and imperial periods. We must not, of course, assume that every reader at every period had the same motive for reading novels, but it seems likely that the novel, as a form, was intended for private reading and that the thematic centrality of love reflects a new concern with the individual self. Moreover, all the novels deal in some oblique form with the question of what it means to be Greek and stress a continuity with the

Hellenic past that pointedly ignores the very existence of Rome. Interestingly, none of the surviving novelists was a native of the Greek mainland, and several of them were of non-Greek extraction, indicating that the national identity they assert was cultural rather than racial. The central feature of the romantic plot, the exclusive and passionate love of a heterosexual couple, is an important cultural innovation. The Classical model of disparity between sexual partners with an interior dialectic to master potentially disruptive emotions is replaced by a fully reciprocal passion, viewed positively as a valid basis for personal happiness and marital stability. It is difficult to know to what extent the sexual ethic of the novels reflects a movement towards romantic behaviour in real life, but the aspirations it embodies are as much civic as personal. The marriage that is consummated or resumed at the climax of the plot is not just a way of socializing passion, but is in itself a social function, a celebration of the ancestry and self-perpetuation of Hellenic aristocracy and its values and culture.

The earliest novels have a distinctly historical thrust, as if legitimizing their problematic fictionality by filling up the unwritten corners of history. The earliest known novel takes the legendary figures of Ninus and Semiramis – accepted as historical from Herodotus onwards – and transforms them into romantically attached adolescent cousins coyly seeking parental assent to an early marriage. Chariton sets his story in the years following the Peloponnesian War, with a heroine who is a historically attested daughter of the Syracusan statesman Hermocrates, and a Persian king Artaxerxes facing a revolt in Egypt apparently modelled on that of 360 BC. Among the fragmentary novels is one whose protagonists are the son of Miltiades and the daughter of Polycrates of Samos, and whose scenario plays out around events recorded by Herodotus. Later novels emancipated themselves from literal historicity, and in some cases moved their plots into more exotic locations, which none the less adhere to a geographical and historical verisimilitude defined by Greek literary tradition.

There is a marked division among the five extant novels between, on the one hand, Chariton and Xenophon, who are relatively simple in construction and expression, and, on the other, the three later authors, whose erudition and complexity are clearly linked with the rhetorical renaissance known as the Second Sophistic. Chariton tells his story with pace and skill, in a style modelled on that of Xenophon, maintaining the pose of a historian roughly contemporary with the events he narrates. Although his is probably the earliest European novel to have survived, it is already playing with the ethical simplicity of its generic stereotypes. Its heroine, for example, is apparently

kicked to death by her beloved but jealous husband near the beginning of the book. Reviving in the tomb, she is stolen by tomb-robbers and taken to Miletus, where she discovers that she is pregnant and reluctantly agrees to a bigamous second marriage for the sake of her unborn child. The second husband, who fills the conventional role of rival, is no villain, but a cultivated and morally scrupulous gentleman, agonizing over his infatuation. Xenophon's novel is, in terms of literary quality, the weakest of the five: baldly narrated and luridly imagined adventures succeed one another rapidly and with little rational connection, prompting the theory that what we have is only an epitome of a more satisfactory original. Of the sophistic novelists, Achilles Tatius is the only idealistic novelist to employ a first-person narrator, and his story often comes close to parodying the genre: the heroine Leucippe, for instance, would be only too happy to lose her virginity prematurely to the hero and narrator, Cleitophon, and is saved only by a comically sexual dream that leads her mother to interrupt their illicit tryst. Later, the theme of apparent death takes a Grand Guignol twist when Leucippe is ritually disembowelled before her lover's eyes and her entrails cooked and eaten, only for him to learn a couple of pages later that her sacrifice was an elaborately staged trick with a retractable knife and a sheep's bladder. Cleitophon for his part, when Leucippe is apparently decapitated, obsessively maintains his chaste devotion despite being married to an amorous and increasingly frustrated widow from Ephesus; but when his beloved and his wife's husband return miraculously from the dead, he casually consummates the now void marriage on a jailhouse floor before escaping disguised as a woman. Achilles packs his pages with sophistic digressions and rhetorical debates, for example on the relative merits of heterosexual and homosexual intercourse or the effects of love in the natural world. Of the two novels summarized by Photios, that of Antonius Diogenes was untypical of the genre: immensely long and relegating the love interest to subordinate episodes, it dealt primarily with travel and geographical paradoxography, leavened by a dose of black magic and the supernatural, and was elaborately structured as a series of concentric narratives, including some plausibly serious Neopythagorean philosophy. Iamblichus' novel seems to have been full of sensational and melodramatic incident, and innovated by keeping its lovers together in body but separated by psychological forces such as the heroine's homicidal jealousy.

The ideal romance was not the only form of fiction written in ancient Greek, but the absence of critical discussion from antiquity makes it impossible to know precisely how fictional genres were conceptualized. The old distinction between the serious idealistic

Greek romance and the comic-realistic novel represented by the Latin writers Petronius and Apuleius seems untenable in the light of the recent identification of fragments such as those of the *Phoenician Story* of a certain Lollianus, which combine blood-curdling horror and scatological comedy. It may be that other boundaries, such as that between full-length novels and *Milesian Tales*, short stories of scabrous content, are equally illusory.

With the probable exception of Heliodorus, the production of novels apparently ceased early in the 3rd century AD, although papyri indicate that they were still read, at least in Egypt, in the 7th. The disappearance of the genre may be partly due to its inherent limitations and progressive ossification, but the most important causes must be sought in the changing cultural circumstances of late antiquity which removed its market appeal. However, motifs from the romances find their way into Christian narratives such as hagiographies, martyrologies, and apocryphal acts, and at least one of them (*Metiochus and Parthenope*) was absorbed into Near Eastern traditions. In Byzantium, Heliodorus and Achilles Tatius were to some extent privileged by the fact that their authors were believed to be Christian; Achilles' protagonists even resurface as the parents of St Galaktion of Emesa! Despite spasmodic signs of interest, including Photios in the 9th century and a spate of learned imitations in the 12th, the survival of the rest was precarious, and they had little direct influence either on the later vernacular romances or on the birth of the modern Greek novel, both of which looked to models from western Europe.

Obsidian

Obsidian is a kind of volcanic glass, normally dark blue to black in colour. It is exceptionally hard, fractures in the same way as flint, and, like flint, was employed to provide razorsharp cutting edges for tools (including knives and sickles) and weapons (including arrowheads). Studies of the techniques of manufacture of marble figurines have suggested that obsidian implements were among the tools employed.

In use from the Palaeolithic period, obsidian seems to have been most commonly employed in the Aegean during the Neolithic and Early Bronze Age, before bronze had become widely available. In the Late Bronze Age, vessels were occasionally available. In the Late Bronze Age, vessels were occasionally manufactured of this material, usually a variegated type.

Investigation of the extent to which obsidian continued to be used in later antiquity has proved somewhat inconclusive but it seems likely that, in addition to flint and chert, it was a regular alternative to metal in places where the latter was unavailable because of cost or inaccessibility. Today these materials are still sometimes used by primitive agricultural communities for the “teeth” of sickles and threshing sledges, and they have been employed for gun flints.

The only two ancient Aegean sources of obsidian are on the islands of Melos (in the southwestern Cyclades) and Yiali (by Nisiros in the Dodecanese). That on Melos was the earlier and by far the most important; Yiali obsidian was used for most of the Late Bronze Age vessels mentioned previously. Melian obsidian is widely distributed on prehistoric sites in the central and south Aegean and on the Greek mainland as far north as Thessaly. Sometimes it is found in the form of finished artifacts, sometimes as unworked cores. The finer blades were struck off larger “cores”, or else detached by “pressure flaking” with a wooden tool.

Obsidian was probably an important item of trade in prehistoric times. One theory sees the commodity exploited by the Melians and exported by them, either worked or unworked; another holds that the raw material was removed by visitors to the island, without reference to the locals, and worked elsewhere.

The significant contributions of obsidian to the Greek tradition seem chronologically limited to the prehistoric phase. It certainly played an important part in technological developments which affected warfare and various “industries” and crafts. Just as important however was its

role in stimulating trade and contact, and in giving the Aegean area in general and Melos in particular some economic and cultural sway over their neighbours. Apparently Melian features in the pottery of other islands, and Cycladic exports to and influence on sites on the Greek mainland in the Early and Middle Cycladic periods, may have been brought about in this way.

In Classical and later times the use of obsidian helps to demonstrate the natural dependence of poorer and more remote communities on cheap and accessible raw materials, and thus relatively primitive technology. In this way clearly documented uses of the material can often illuminate prehistoric finds where direct evidence for the function is lacking. Such links also suggest a long and continuous history of use.

Olbia

City on the north Black Sea coast

Olbia, situated on the right bank of river Hypanis (today Bug), near the mouth of the river Borysthenes (now Dnieper) in modern Ukraine, was founded by the Milesians, possibly as early as the end of the 7th century BC (according to the finds). It was one of the largest Greek colonies on the north coast of the Black Sea and was well known in the ancient world. Surrounded by native tribes (Scythians, later Sarmatians), Olbia had close, but sometimes tense, relations with its

hinterland. Already in the first half of the 6th century numerous small settlements had developed on both banks of the Hypanis and Borysthenes, the most important of them on the island of Berezan.

Written sources about Olbia are rather scarce (and are for the most part inscriptions), but there are rich archaeological finds; as there was no later reoccupation of the site, it has consequently suffered only from being used as a quarry in the 18th and 19th centuries for the construction of the Turkish (and later Russian) fortress at Ochakov, and for building houses in the neighbouring village of Parutino. The area has been excavated in many campaigns since 1901.

The ancient city had a triangular shape with an upper town and a lower one which is now largely submerged beneath the waters of the Bug. The upper town began to be settled in the 6th century BC; some of the excavated streets go back to that time (it has now become clear that Olbia never had a unified rectangular street system, as was long assumed). About 550 BC the *temenos* of Apollo Iatros was constructed, some 20 years later that of Apollo Delphinios, and – to the south of it – the agora followed. About 500 BC the style of private housing changed from dug-out dwelling to surface buildings.

The city was most prosperous from the 5th to the 3rd centuries BC. Its harbour was one of the main emporia on the Black Sea for the export of cereals, fish, and slaves of Greece, and for the import of Attic goods to Scythia. Its silver and bronze coins (not minted but cast) circulated widely. In the 5th century Olbia may have been intermittently under the sway of a local tyrant or of Scythian princes; at the beginning of the 4th century the city acquired a democratic constitution (*demos* and *boule* appear regularly in inscriptions). Already in the middle of the 5th century it had undertaken intense building activity (around this time Herodotus visited the city to gather information about the surrounding regions). The territory of the city increased, with the lower town now being populated as well; a water supply system and probably also the first city wall were built. The construction of private houses reached a peak at this time; the houses (built with stone or brick walls and tiled roofs), of one or two storeys, often had a cellar, wall painting, and mosaics. In the necropoleis found to the north, west, and south of the city many graves had vaulted tombs in a form characteristic of the north Pontic area.

The central *temenos* (precinct), dominated by the Ionic temple of Apollo Delphinios, was enlarged and given its trapezoidal form; apart from the main altar (with a platform probably for the priest and three holes for wine offerings), there were several other buildings in the precinct (further altars, a treasury, a cistern, a workshop for bronze). In the agora area a gymnasium was built, probably with a bath (enlarged in Hellenistic times). The western *temenos*, with a columned

hall at its entrance, contained sanctuaries for Apollo Iatros and later for Hermes, Aphrodite, and the mother of the gods, a building of unclear function with three round and six rectangular altars. Since the 6th century BC one of the most important cults in the lower Bug region had been that of Achilles, imported by the Milesian colonists and originally centred on the island of Leuce (thought to be the dwelling place of the great hero), where the inhabitants of Olbia erected several monuments with inscriptions; countless magical graffiti, including the name of Achilles, were found in Olbia itself and its surroundings. Moreover, in the central *temenos* little plates made from bone with graffiti on them testify to the existence of a thriving community devoted to Orphism (a mystery cult centred around Dionysus and Orpheus) at Olbia in the 5th century. Many works of art (sculpture in stone, clay, and bronze and reliefs), imported from Greece as well as of local origin, have been found, such as a late Archaic *kouros* (naked youth) of limestone from the gymnasium, the famous grave stele of Molpagores' son Leoxos (490/480 BC) showing a naked youth in Greek style on one side and a person in Scythian clothing on the other, and the votive relief of the *sitones* (see below). There was also extensive local production of vases.

Reports of further political events are scarce. At the beginning of the Hellenistic period (probably around 325 BC), Zopyrion, Alexander the Great's governor of Thrace, made an unsuccessful attempt to take Olbia by force. New building activity shows the ongoing importance of Olbia as well as the persistence of threats from outside: numerous fortified farmhouses were built in the vicinity; the agora was provided with an impressive portico, and other new public buildings were constructed, the town walls renewed, and several towers added; a new cult, that of the god Demos ("people"), was established. Since the middle of the 3rd century BC, however, the whole agricultural territory of Olbia was repeatedly pillaged by invading barbarians, which put the nutritional base of the city severely at risk. A board of five *sitones* (food commissioners) was then installed who had to procure cereals and distribute them among the inhabitants; later the city tried to check famine, social unrest, and external threats by courting the leaders of the semibarbarian "Mixellenes" as allies. This led to the loss of the city's independence. In the middle of the 2nd century BC Olbia was under the overlordship of the Scythian King Skiluros, and in the 1st century BC it became part of the Bosphorian kingdom of Mithridates Eupator. The biggest disaster, however, came with the sack of the city by the Getae under King Burebista in 55 BC: Olbia was burned down and lost two-thirds of its settled area. Still, it continued to exist, albeit on a much smaller scale; more and more native people were integrated among the citizens, and these Scythian elements

began to play a major role in the political life of the city. Olbia was in this state when it was visited by Dio of Prusa during his wanderings (i.e. shortly before AD 96); Dio has left a vivid description of the city (which he calls Borysthenes, as others do, because of the proximity of the harbour of Borysthenes on the river of that name) in his *Borysthenitic Discourse*. In the 2nd century AD a new period of prosperous stability began: under Antoninus Pius a Roman garrison built the citadel in the southern part of the upper town; under Septimius Severus the region was incorporated into the province Lower Moesia. Two destruction levels show that Olbia was burned down twice in the 3rd century, probably during the so-called Scythian or Gothic wars. When exactly it ceased to exist is uncertain: Byzantine coins found at the site suggest that a settlement (though very much reduced) may have outlasted antiquity.

Oligarchy

Rule by the "few"

Oligarchy ("rule by the few") was a fluid term that first emerged in 5th- and 4th-century BC Greek historical, political, and philosophical texts. In a precise context, oligarchy meant broad-based constitutional government by property owners of the Greek city states, who as exclusive citizens could both vote and hold office; but in a wider sense, oligarchs came to be identified as any group who, whether through legal means or by force, sought to check the power of democracy.

Government during the later Mycenaean period (1600– 1200 BC) was dynastic, controlled by a king (*wanax*) who occupied a centralized fortified palace and its surrounding countryside. And while Linear B tablets reflect cadres of other high political officials, rule was clearly in the hands of a supreme chief who claimed power through inherited privileges.

Myths and stories found in later Greek literature give the impression that local chiefs (*basileis*) controlled tribal organizations during the Dark Ages (c.1200–700 BC). Power was probably in the hands of a single individual, and was passed on to male children. Whereas there were obviously a select few local princes who consulted the king, most government was not constitutional, but based largely on the ability of local potentates to muster subservient shepherds and farmers into successful military bands.

The emergence of more than 1000 Greek city states in the 8th century BC ushered in the first period of truly constitutional government in the Mediterranean – local communities were now often represented by independent landowners who sought political power commensurate with their hoplite infantry prowess and agricultural expertise. Yet, this transition from aristocratic government to rule by property owners was not automatic, but often characterized by periods of autocracy, as transitional tyrants for two or three generations – most often in the commercial, seafaring states near the isthmus or in the islands – might wrest control from noble families in the purported interest of the common people. In some areas of Greece – Thessaly and Sparta are good examples – vestiges of monarchy, coupled with consulting bodies of aristocratic families and supported by serfdom, continued for centuries.

By 700 BC many poleis were beginning to establish governments by property-owning citizens, which might constitute a third to half of the resident native-born male population. Aristotle later called such constitutions either “polities” (“polis governments”) or “timocracies” – rule by those who enjoyed influence, prestige, and property. In fact, such timocratic governments were moderately oligarchic, allowing small land-holders to vote on legislation proposed by elected senior officials.

By the 5th century BC the rights to participate in the assembly and hold office were extended to the landless poor at a few cities – most notably Athens – as part of a slow liberalizing Panhellenic trend that would be characterized by office-holding by lot, public works, navies, urban fortifications, and subsidized pay for jury service and assembly attendance. During the rise of democracy in the 5th century, the definition of oligarchy crystallized as a reactionary alternative to more egalitarian constitutions, and the two words democracy (“power of the

people”) and oligarchy (“power of the few”) first appeared in the Greek language and in clear antithesis to each other.

In reality, it was often difficult to calibrate whether a city state was oligarchic or democratic, since most had councils and elective officials. Aristotle later attempted, without much success, in book 4 of his *Politics* to create a typology of constitutions, characterized by four variants of both oligarchic and democratic government. But “the few” and “the people” were relative terms – some “oligarchic” states might have very low property qualifications and a high percentage of citizen participation, while the offices of nominally “democratic” constitutions could de facto be staffed exclusively by more prosperous landholders.

By the late 5th and 4th centuries, and especially during the Peloponnesian War (431–404 BC), oligarchy took on a far more precise definition: rule of those with capital and in alliance with Sparta. Thus the great revolutions at Corfu and elsewhere during the war were not marked so much by disagreements over the voting franchise or the constitution per se, as by strife among larger landowners and businessmen against those without money. The former welcomed the intervention of Spartan infantry to protect their interests, the latter looked to the Athenian fleet to champion the cause of the poor, who saw democracy not so much as voting privileges but rather as entitlements and subsidies for the landless. Indeed, Aristotle concluded that oligarchy had come to mean simply “rule by the rich”, democracy “rule by the poor”.

The defeat of Athens (404 BC) did not result in a spread of oligarchies championed by the victorious Spartans. Rather, the increasing monetarization of the Greek economy and the corruption of census rubrics brought on by the demands of the war led to a rise in democratic government. States in Boeotia and in the northern Peloponnese increasingly liberalized their constitutions to include participation by most native-born residents, and often gathered neighbouring communities into federal leagues under democratic auspices that would survive into Roman times. Coups by both radical and moderate oligarchs at Athens, Argos, and Mantinea were often shortlived. The harsh nature of Spartan hegemony, and the insular nature of Spartan society, did little to encourage a return among the city states to oligarchic rule.

Most Greek thinkers, themselves aristocrats, preferred moderate oligarchies, as consistent with the traditional values of the old agrarian polis, and a bulwark against the financial and cultural liberalism spawned by imperial Athens. Thucydides felt the brief rule of 5000 property owners at Athens in 411 was the best constitution in the history of the state. Aristotle lamented the passing of the rule of a

middling agrarian population that had avoided the extremes of both reactionary autocracy and radical democracy. The so-called “Old Oligarch” – author of an anonymous 5th-century BC political tract – described the reckless dynamism of Athens largely in terms of its abandonment of traditional oligarchic restraint. Plato’s political ideas are confusing; he clearly did not favour democracy but instead looked to government based on either natural or enforced hierarchies.

In the later 4th century BC the wealthy of the polis continued to yearn for government by the few, and now looked not to traditional oligarchies, but rather to the growth of Macedonian monarchy. Philip II and his son Alexander the Great sought to subsidize wealthy politicians in the Greek city states, promising local autonomy to oligarchic cadres who could maintain order, provide tribute, and furnish manpower for the Macedonian cause. The successors of Alexander in both Greece and Asia Minor continued to favour such oligarchies, which were increasingly narrow groups of wealthy urban elites, often absentee owners of estates in the countryside. Class strife in the ancient world is largely a Hellenistic phenomenon, and was waged by those dispossessed farmers who increasingly became the urban unemployed or rural serfs, and now lacked both the freedom and the rights that had existed under traditional oligarchy.

The nomenclature of Hellenistic government as it survives in the histories and on inscriptions is confused and often euphemistic. It can be assumed that reference to “the people” and “the council” usually meant a select few, who governed under the aegis of monarchy and on the basis of vast wealth. While there were still democratic councils among the federated leagues in Achaia and Aetolia, most city states were increasingly governed by elites owing allegiance to kings. Gone was any traditional idea of oligarchy as the rule by a substantial landowning minority of the town’s residents, who were responsible entirely for a community’s defence, foreign policy, and financial health. Popular rule in the Hellenistic age simply meant for most cities control by the indigenous rich in service to a foreign monarchy. No local oligarchies in the Hellenistic age enjoyed real autonomy.

After the Roman conquest of Greece (146 BC), most Hellenic provinces were run by local oligarchic councils who reported to a Roman executive proconsul. While deliberations were often by consensus vote, and while the language of constitutional government might suggest popular assemblies, in fact foreign executives, backed by the legions, retained the real power. In general, the Romans found that local elite oligarchies ensured that taxes were promptly paid and social unrest minimal.

Olive

The olive is a fruit-bearing tree that is imbued with a symbolic meaning and a practical value that make it of pivotal importance to the understanding of everyday life in Greece, of the socioeconomic realities of the country, and of ritual practices, beliefs, and customs. The olive is the national tree of Greece, while olives and olive oil are its national products.

The olive is one of the oldest cultivated trees in the world. The Greeks were among the first to engage in its systematic cultivation, in the Early Bronze Age, that is in the 3rd millennium BC, though archaeological evidence reveals that olive-oil production started much later, in the Late Bronze Age. Its extraction was facilitated by the introduction of the lever press, which in various combinations remained in use up to the 20th century.

Olives constituted an important ingredient in the diet of the ancient Greeks. It has been suggested that a wealthy household would consume approximately 200–330 kg of olive oil per year. It had many uses, and in antiquity it was considered to be a “luxury product”. It was first used as a perfume or as an essential substance in the production of perfumes and ointments for bodily care, probably because of its therapeutic and cleansing qualities. It was also often used as a means to heal maladies; Hippocrates, the father of medicine, suggested more than 60 uses of olive oil for healing purposes. From the 6th century BC onwards, olive oil was introduced to food and acquired great economic significance. At around the same time it was also increasingly used for lighting. Olive wood was employed for building and in the making of various artefacts. Occasionally olive kernels and wood were also used as fuel.

The olive tree is evergreen and is characterized by its longevity and durability. These three distinct characteristics earned it a central position in Greek religion. Moreover, its sacred symbolism was derived from the great economic importance of its fruits and their products. It is for this reason that the olive tree was considered to be

the sacred tree of the goddess of wisdom, Athena, who was said to have created it on the Acropolis in her contest with the sea god Poseidon for the control of Attica. The olive branch was a symbol of peace and victory and at the Olympic Games olive wreaths adorned the heads of victors. Similarly, olive oil was given as a prize to the victorious athletes at the Panathenaic Games. Because of its symbolic value olive oil was frequently also used for ritual purposes. It was used to smear bodies before burial, offered in the form of libation to the dead and the gods, and fed the lamps in the temples.

Olympia

Sanctuary in the Peloponnese

Olympia is situated in a valley at the confluence of the Alpheus and Cladeus rivers in Elis in the northwest of the Peloponnese. It attracted not only pilgrims and athletes to the sanctuary, but developed into a kind of fairground for traders, artists, and literary figures. Olympia at the time of the festival was said to be crowded, hot, noisy, and full of flies. There was a taboo against females, certainly married women, from participating in the festival. Girls, however, had their own festival there called the Heraia. The importance of Olympia, an otherwise insignificant place, may lie in its association with the cult of Zeus. Strabo also records that its reputation came from its oracle of the Earth Goddess.

The site was not identified during the Middle Ages, but was discovered by Chandler in 1766, albeit covered with some 4 m of alluvium from the changing courses of the rivers. French archaeologists under Maison started digging in 1829 and removed to the Louvre some of the metopes from the temple of Zeus. The later school of German archaeologists to work on this site include Curtius, Dörpfeld, Furtwängler, Kunze, Mallwitz, and Sinn. Many recent discoveries are changing traditional ideas about Olympia, especially dating.

The traditional belief is that there are Mycenaean remains as early as 1500 BC, that the first shrine to Zeus was built about 1000 BC, that athletics were first recorded in 776 BC, and that the games ended in AD 393 with the edict of the Christian emperor Theodosius I. Mallwitz, however, has argued that there is no convincing evidence for a Mycenaean sanctuary, but that Olympia became a sanctuary first in the 9th or 8th century BC and that athletics came later. The foundation date of 776 BC for the games is derived from the lost victory list of Hippias of Elis, but the archaeological evidence of the site, especially the appearance of wells in the eastern part near the stadium at the end of the 8th century BC, may point to a date closer to 700 BC. Recent inscriptions with the names of victors show that the games were still going strong in the 3rd and 4th centuries AD. Coins and other finds in the stadium seem to suggest that the games extended for at least a century longer than the traditional closing of AD 393, and that Christianity, far from destroying pagan cults, existed side by side with them.

The Altis was the walled, sacred area, a grove consisting largely of plane and olive trees. The chief shrine there was the great altar of Zeus, said to be 7 m high, but Olympia was not dedicated to Zeus alone, for Pausanias (5. 14. 4–10) records more than 70 altars in the Altis, although most of them are not directly connected to Zeus and the games, and very few of them can be located with any accuracy. The oldest shrine was that of Pelops. The major buildings in the historical period included the temple of Zeus, the temple of Hera, the precinct of the Earth Goddess, the precinct of Pelops, and the 12 treasuries, which were used by the city states as “bank vaults” and for the display of wealth. Outside the Altis *inter alia* were the council chamber for the Hellanodikai (officials and judges), the workshop of Phidias, and primitive bathing places. In the 4th century BC were added the Metroon, the Echo portico separating the Altis from the stadium, the Phillipeion erected by Philip II of Macedon (showing the political importance of Olympia), and outside the Altis the Leonidaion (the guest house) and southern portico. In the Hellenistic period the triumphal archway into the stadium from the Altis was built. Several

baths date from the Roman period, as the site became more developed. A good water system was made possible by Herodes Atticus in the 2nd century AD with the construction of the monumental fountain known as the nymphaeum. A Christian basilica was built on the foundations of the workshop of Phidias. Other buildings are being discovered including the clubhouse in the southwestern corner of the site. The Altis was also used as a “Hall of Fame”, where victorious athletes were allowed to set up statues of themselves. Bases of statues of Zeus (Zanes) were erected at the foot of the Hill of Cronus at the expense of athletes who had cheated.

Traces of three stadia remain to the east of the Altis on approximately the same site, a flat area at the foot of the Hill of Cronus. Stadium I was partly within the Altis and dates from the Archaic period, though little is known about it. Stadium II, dating from the late 6th century BC, had artificial embankments for spectators on the north and south. Stadium III was more elaborate and was located about 75 m to the east with additional embankments on the east and west together with a judges’ box. The altar of Demeter can still be seen in the stadium. The palaestra and gymnasium were added in the Hellenistic period, but it has recently been suggested that the gymnasium was used not for athletic training, but for cultural purposes. Nothing remains of the hippodrome, although its location between the stadium and the Alpheus river, the elaborate starting device in the shape of the prow of a ship, and other features are known from Pausanias (6. 20. 10–19).

The most famous work of art, the monumental statue of *Zeus* (more than 13 m high) was made of gold and ivory by Phidias, and was considered one of the seven wonders of the ancient world. It stood in the entrance to the Doric temple of Zeus built by Libon, but no longer survives, having been transported to Constantinople in the 4th century AD, where it was destroyed by fire. The museum sculptures include the pediments and metopes of the temple of Zeus, the colossal head of Hera, the *Nike* of Paeonius, the *Hermes* of Praxiteles, clay sculptures of the head of Athena and of Ganymede and Zeus, thousands of bronze statuettes, bronze sheets with reliefs, and various bronze weapons, architectural bronzes, and tripods (the most common votive offering at Olympia).

Olympia was partly destroyed by the invasion of the Heruli in the 3rd century AD and the later invasions of the Slavs. An earthquake in the 6th century destroyed the temple of Zeus and other buildings. The changing courses of the Alpheus and Cladeus have covered parts of the site, especially the hippo-drome (still unexcavated). Today Olympia is a tourist attraction, with a museum area (originally founded in 1886, but now a modern building). The stadium, as we

now see it, is based on the stadium as it was thought to be in the 2nd century AD, with start and finish lines visible about 200 m apart. It remains unimpressive to look at (by comparison with the stadium at Delphi) with grassy banks, dusty track, and no seats for spectators (as it probably was originally), and is totally unsuitable for modern sports. For every modern Olympiad the Olympic torch is ritually lit at the site of ancient Olympia.

Olympic Games

The Olympic Games were the principal athletic games in the ancient world. First recorded in 776 BC, they were banned in AD 393 but

survived in some form until the early 6th century, and were revived as a global event in 1896.

Greek myth attributes the establishment of the Olympic Games to the Idaean Dactyls, the iron-working attendants of the mother goddess Adrasteia who are identified with the guardians of the infant Zeus, to Heracles, and to Pelops in celebration of his conquest of Oenomaus in a chariot race. The traditional date for their establishment in 776 BC may, therefore, indicate merely a revival, but nothing is known of their possible earlier history. They were held at Olympia, a sanctuary named for the presiding deity Zeus Olympios (i.e. of Mount Olympus). Although there is evidence at Olympia, in the western Peloponnese, for habitation from the Early Helladic period, in the Archaic, Classical, Hellenistic, and Roman periods it was only a sacred site (the altis) with an associated stadium and an increasing number of buildings for administration, training, and lodging. It was first under local Pisatan and from c.470 BC under Elean control.

In 776 BC the games consisted of no more than the stade race with athletes drawn from the surrounding area, the inaugural winner being traditionally a local baker, Coroebus. Other athletic events were added in the late 8th century BC, equestrian and boys' events in the 7th century BC, and further additions followed, including competitions for trumpeters and heralds in 396 BC. Many of the early victors were Spartan, but by the 6th century BC the games were truly Panhellenic, competitors travelling from all the Greek-speaking areas of the world and especially from southern Italy and Sicily. The games grew also in duration, from one day to six days in the Classical period. During the Hellenistic period there was no lessening of popularity, as Hellenistic monarchs vied with each other to add new buildings. Although the Roman conquest initially involved a vast diminution in the games' prestige, they now become open to at least some non-Greeks (the last known victor, of boxing in AD 369, was Varazdates, the crown prince of Armenia). In the late 1st century BC, however, king Herod of Judaea became president of the games and by a huge endowment encouraged a revival that was continued by subsequent imperial patronage: Augustus' right-hand man Agrippa repaired the temple of Zeus and both Tiberius and Germanicus won chariot races, while at games postponed for his own convenience (held probably in AD 67) Nero competed in and fraudulently won various events (including chariot racing and some unique musical and literary competitions). Still very popular in the 2nd century AD, the games suffered during the uncertainty of the following century and the sanctuary had to be fortified c. AD 268 because of the threat of the marauding Heruli. Held every four years without intermission from 776 BC until AD 261, they may possibly have been held only sporadically thereafter. Despite St

Paul's enthusiasm for athletics, the games' combination of nudity and paganism must have made the growing number of Christians agree with the words of St Cyprian: "True Christians must shun with eyes and ears those vapid, dangerous, tasteless performances." They certainly would have come under the ban of the edict of Theodosius I in AD 393 that closed pagan cults and sites, but archaeological evidence suggests use of the stadium at Olympia until the early 6th century, and in some form they continued at Daphne, near Antioch, until AD 521.

Through most of their history they were the premier athletic festival. Next in rank were the Pythian Games, held quadrennially at Delphi in honour of Apollo and including many musical competitions, and the other two "crown games", the Nemean and the Isthmian, both held biennially in honour of Zeus and Poseidon respectively. The Olympic Games furthermore served as a model for many other festivals, some of which proudly proclaimed themselves "isolympic".

In the Classical period the first day of the celebrations was probably devoted to sacrifices, prayers, oath taking, and the checking of qualifications. Competition began on the second day. The sacrifice of 100 oxen (hecatomb) was the religious highlight of the third day, and the sixth day ended with further sacrifices and a celebratory banquet for the victors. In addition to the athletic competitions the festival gave visitors a huge fair with a wide array of entertainers, hucksters, and pickpockets.

Before the games Elean heralds proclaimed the Olympic Truce: this demanded safe conduct for all competitors and spectators travelling to and from Olympia and forbade any state to make war against the Eleans. Politics did, however, still intrude into the games, as Pheidon, tyrant of Argos, temporarily took over their organization in the early 7th century BC, and the Spartans turned the celebration of 428 BC into an anti-Athenian demonstration, while being themselves debarred from participation in 420 BC for their refusal to pay the fine imposed by Olympic law for attacking an Elean fortress.

Women, but according to Pausanias not girls, were banned even as spectators since athletes competed nude (there were separate games for girls held at Olympia in honour of Hera, but documentation is sparse). Athletes were required to train at home for at least ten months prior to the games, and during the 30 days of practising at Elis the poorest were weeded out by the judges since only the best would not do dishonour to Zeus. Judges were all Pisatan and later Elean and famous for their impartiality. Infringements of the rules for events resulted in beatings on the spot, disqualifications, and fines, the last of which were spent on statues (*Zanes*) erected in the sanctuary to give warning to others. Although prizes were merely garlands of wild olive,

victors were generally richly rewarded by their home states. Since they could also win valuable prizes in kind and, increasingly in the Hellenistic period, monetary prizes at minor festivals, many were undoubtedly professional. Paid trainers became common from the 5th century BC and by c.50 BC athletes had formed their own trade union.

With the publication by the historian Timaeus, c.300 BC, of a synchronic list of Olympic victors (*Olympionikai*) the practice arose of dating other events by the Olympic quadrennia, Eratosthenes adding the refinement of subdivision into individual years (e.g. summer 774 to summer 773 BC is the third year of the first Olympiad). Despite problems of equating this system with the bewildering variety of other dating systems known in the Classical world, it survived well into the Byzantine period.

Olympus, Mount

Mountain in Thessaly

Olympus is the highest mountain in Greece and the second highest in the Balkan peninsula. It bears the ancient name “Thessalian Olympus” and is the deified mountain bridging Thessaly and Macedonia. It occupies the northeastern part of Thessaly and the southwestern end of central Macedonia, and straddles the boundaries of the counties of Larissa (province of Elasson) and Pieria. The mountain is shaped like a vault, having at its peak a plateau, from which other peaks rise by more than 2500 m. Above a gorge, some 600 m deep, the peaks rise of Mytikas or Pantheon (2,917 m), Stefani or the Throne of Zeus (2,909 m), Skala (2,866 m), and Scholio (2,911 m), forming a semicircle.

Olympus is a large mountain covering a relatively small area. Its width from east to west is no more than 25 km, from north to south 28.5 km, its perimeter 150 km, and its area 500 sq km. It is distinguished by its pointed peaks, its lengthy ridges, and its steep

slopes that are traversed by deep gorges. Its main body, known as High or Upper Olympus, is distinguished from Lower Olympus (of which some specialists consider it to be a part) by the stream of Ziliana, the plain of Carya, and the river Elassonitiko.

The rock consists mainly of limestones and dolomites. From the streams that run down the mountain slopes only one has water throughout the year, the river Enipeas that passes through Litochoro; the rest are seasonal. The vegetation is limited. Typically alpine at 2,000 m and above, the lower zone is covered by forests, which in the higher regions consist of fir trees and in the lower of pines. The eastern side has more forests than the western. More than 1,700 plants have been registered in the area, i.e. about 25 per cent of the entire Greek flora. The fauna does not present any particular features. Some 32 different species of mammals have been identified as well as 108 bird species, while the mountain is famous for its many kinds of butterflies. In antiquity Pausanias reported the existence of lions on Olympus.

The climatic conditions are highly variable. At the foot of the mountain the climate is typically Mediterranean, while the northern and eastern slopes have greater rainfall. Average temperatures range from 0° to 20° C in the summer, and in the winter from (-20° to +10° C. The mountain is covered by snow for about seven months of the year, usually from November to May.

Historically Olympus has been the target of various expeditions and was known as an ideal place for hunting (e.g. by Sultan Mehmet IV). The botanists Theodor von Heldreich and Theodoros Orphanidis carried out a great deal of research on Olympus in the 19th century, while one ambitious expedition was undertaken by the German geographer H. Barth. In 1937 the first National Greek Forest Area was established on Olympus in order to protect the geomorphology, the fauna, and the flora of the mountain. Since 1981 this protected area has been incorporated in the "Programme on Man and the Biosphere" of UNESCO.

In ancient Greek mythology Olympus was considered to be the sacred mountain of Greece. After the victory of Zeus over the Titans, it came under the control of Zeus and became the home of the Olympian gods. Zeus' throne was believed to be at the highest peak, while the other gods resided on the surrounding ones. The mountain was also connected with Orpheus, who taught the Orphic mysteries and died there. It was also dedicated to the Olympian or Pierian Muses.

The name "Olympus" appears for the first time in the Orphic texts and is subsequently mentioned as such by all ancient Greek writers. It is generally held to be derived from a name used by the Aeolians, who lived on the western and southern shores of Asia Minor, and dates

back to 1800 BC. The etymology of the word is uncertain.

Olympus was of great symbolic importance to the ancient Greeks. As the home of the gods, it symbolized immortality, high honour, and ideals. The epithet "Olympian" was given primarily to Zeus and thus signified grandeur and godliness. It occupied a central position in ancient Greek religion and cosmology, was connected with a specific philosophical world-view and attitude towards the world. The Olympian gods were the symbols of a particular *Weltanschauung*, which permeated ancient Greek culture as a whole. It is no wonder that, according to one view, while Delphi represented the *omphalos* (navel) of the earth, Olympus constituted its head (= mind).

In historical times the regions around Olympus were populated by various Greek tribes. Its mountainous routes were of the utmost importance during military expeditions, ranging from the period of the Persian Wars to the Roman conquest of Greece. At the foot of the mountain several significant cities were founded, including Dion and Pythion. The first human settlement on Olympus must have been established around 1000 BC near Hagios Vasileios and Mesonisi, where several tombs have been uncovered dating from 1000 to 700 BC. Further archaeological excavations and topographical research have unearthed numerous inscriptions, coins, and artefacts from various historical periods that point to relations with both Thessaly and Macedonia.

Olynthus

City in Chalcidice

Olynthus was located at the head of the Cassandra gulf on the Chalcidice peninsula, approximately 4 km inland from the sea. It was built on two flat-topped hills rising about 30–40 m above the surrounding plain. According to mythology, the city was named after Olynthus, a son of Heracles and Volve. Another myth refers to Olynthus as a son of the king of Thrace, Strymonas, who was killed during a lion hunt. Thus, Vraggas built the city of Olynthus to honour his brother's memory. The ending of the word Olynthus implies a pre-Hellenic provenance for it. Although the location of the city has been known since the 19th century, it was in the 1920s and 1930s that extensive excavations were carried out by the American Archaeological Mission led by David M. Robinson. The destruction of Olynthus in the mid-4th century BC has preserved a full ground plan as well as individual details of housing, providing unique information for the Classical Greek city.

In the Neolithic period a small settlement was established on the south hill of Olynthus, but Bronze Age remains are lacking. Occupation begins in about the 7th century BC. Herodotus (8. 127) and Thucydides (2. 99) reported that around 650 BC the district was inhabited by the Bottiaeans, a Thracian tribe, under whose rule the city of Olynthus remained until 479 BC. Together with other towns in the area, Olynthus supplied troops and ships to Xerxes in 480 BC, while during the Persian retreat from Greece (479 BC) Artabazus besieged and captured the city, suspecting a revolt. He then slaughtered its inhabitants and handed Olynthus over to Critobulus of Torone. Around that time new settlers from nearby Chalcidian communities immigrated to Olynthus, which thus became a Chalcidian city.

By the mid-5th century BC Olynthus was a relatively small city. As a member of the Delian League, it paid on average 2 talents of tribute from 454 to 432 BC, much less than other neighbouring Chalcidian cities (e.g. Scione paid 9, Mende paid 8, Torone paid 6). The archaeological remains from this period down to the last third of the 5th century BC are exclusively concentrated on the south hill. Two streets ran roughly north–south along the east and west sides of the hill separated from the brow by one or two rows of rooms. Two cross-streets running east–west have also been excavated, while public buildings were located at the north end of the hill. Moreover, a section of the fortification wall was uncovered in this area.

In 432 BC, facing Athenian aggression, Perdiccas, king of Macedonia, persuaded the inhabitants of a number of coastal Chalcidian cities to move inland to Olynthus and to form a single fortified city (Thucydides, I. 58). This moving up (*anoikismos*) is thought to have given the impetus for the expansion of the old city of Olynthus to the flat-topped hill to the north, and for the laying out of a new grid-

planned section of the city there. Olynthus thus became the chief city west of the Strymon and revolted against Athens.

The north hill was not inhabited until the *anoikismos* of 432 BC. This area, measuring 600 × 350 m, was laid out on an orthogonal plan, according to the Hippodamian town-planning system, with a few irregularities. Seven parallel “avenues” 5–7 m wide, running from north to south, were traversed by streets 5 m wide. Each of the blocks thus formed was 35.40 × 86.34 m and usually included ten houses, grouped in two rows of five separated by a narrow alley. On the east side of the hill, however, the blocks were shortened to allow the roads to follow the topography of the hill.

The population of Olynthus numbered 15,000 inhabitants at the end of the 5th century BC. The houses at Olynthus, sometimes two-storeyed, were grouped around an open courtyard, with rooms on two or more sides. As in most ancient Greek houses, the courtyard was located in the southern part of the house with the portico and the main rooms to the north. The rooms had earth floors, unplastered walls, and very few or no features specifying their function. The houses at Olynthus are modest, lacking large common areas; exceptional are a few “villas” with mosaic floors which stood on the southeast slope of the hill (e.g. the Villa of Good Fortune, the House of the Comedian). Public buildings have been excavated both on the south and the north hills. The agora (marketplace) of Olynthus was located on the west side of the north hill and consisted of an open plaza (85 × 130 m), a stoa with shops, a building with a central colonnade (*bouleuterion*), and a fountain house. The three cemeteries of Olynthus were situated outside the city walls.

The city was fortified by a brick wall against which the first row of houses rested. Originally the city wall followed the contour of the hill. However, during the course of the 4th century BC, the city expanded to the east, creating a new suburb down on the plain. The agora occupied a free space where the old and the new settlements met.

The establishment of the Chalcidian League – a political union of certain cities of Chalcidice under the leadership of Olynthus – in 423 BC contributed substantially to the further development of the city. Following the end of the Peloponnesian War the development of the league was rapid. Around 390 BC it concluded a treaty with Amyntas, king of Macedonia, and by 382 it had extended its domination over the majority of Greek cities west of the Strymon and had even taken possession of Pella (Xenophon, *Hellenica*, 5. 2. 12). The league also issued its own coinage. In 382 BC Sparta was persuaded by an embassy from Acanthus and Apollonia, which was threatened by the rapid growth of the league, to send an expedition against Olynthus. Three years later (379 BC) the Lacedaemonians invaded Olynthus and the

confederacy was dissolved. After the demise of Sparta, however, Olynthus reestablished a league with 32 cities and became very powerful.

When the war between Athens and Philip II broke out in 357 BC, both powers sued for alliance with the league. Olynthus was at first in alliance with Philip, who offered the fertile region of Mygdonia as well as Potidaea to the Chalcidian League (356 BC). Subsequently, alarmed at the growth of his power, the Olynthians dissolved their alliance with the Macedonians and concluded an alliance with Athens (352 BC). Philip used as a pretext the Olynthians' refusal to hand over his brothers Arrhidaeus and Menelaus, who had taken refuge in their city, and razed Olynthus to the ground and sold the people into slavery for having broken their oath as his allies (348 BC). Demosthenes, the Athenian orator, delivered three Olynthiac speeches, urging Athens to send forces to protect Chalcidice. By the time the Athenian fleet reached Chalcidice, Olynthus and other cities of the Chalcidian League were being besieged. Olynthus was partially reoccupied after 348 BC, but a few years later most of the survivors were sent by Cassander to settle in Cassandreia in 315 BC.

Onomastics

Onomastics is the study of names and naming practices. In this article, names are defined as personal names (place names are a different, though related and interesting, study), and Greek personal names are names borne by Greeks, whether in Greece itself or elsewhere in the world where Greeks have settled. In antiquity, as today, that imposes a very wide geographical scope, for already by the 8th century BC Greek cities were sending colonies abroad, in a diaspora which would leave Greeks settled on the Black Sea, in Asia Minor, north Africa, Sicily, south Italy, and beyond. Names always reflect the concerns and values of society, and are responsive to political, cultural, and

religious influences. Changes over time are to be expected, but it is important also to register that there have always been regional variations, at any one time, within the Greek-speaking world.

Modern interest in the collection and study of ancient Greek personal names began in the early 19th century. Almost all the evidence available at that time came from literature, which, even when it includes historical works, can paint only a partial picture of a society. The picture, however, was about to be transformed by the discovery and publication of documentary evidence provided by inscriptions, papyri (for Graeco-Roman Egypt), coins, and artefacts. Documentary evidence is important because it gives the names of relatively ordinary people, and because it is found in all parts of the Greek world, and not just the main centres of literary output, above all Athens.

Inscriptions on stone, by far the greater part of documentary evidence, record citizen lists, decrees, treaties, and judgements but also the more personal tombstones, religious dedications and curses, and the manumissions of slaves. New documentary evidence continues to be discovered, published, and analysed, but it is already clear that the names of upwards of half a million individuals have survived, and tens of thousands of different names. From the 8th century BC the volume of documentary texts increased steadily, reaching its first peak in the Hellenistic age. It is during this period that the fundamental features of ancient Greek naming practices can be observed and documented. It is, however, worth noting that two earlier sources, Mycenaean texts and the Homeric poems, push back the history of Greek onomastics, albeit partially, by a further 500 years.

Dating mainly from the 13th century BC, and written in Linear B, a pre-alphabetic script comprising ideograms, numerals, and syllabic signs, Mycenaean records have been found at Mycenae, Thebes, Tiryns, and Pylos on the mainland, and Knossos and Cydonia in Crete. There are many uncertainties in interpreting the names in these documents, because the spelling is ambiguous and because, being inventories, they supply no context, but Mycenologists are agreed that the basic formations of Greek names as described below were already in place, including familiar names such as Theodora and Alexandra. The same is true of the Homeric epic poems, the *Iliad* and the *Odyssey*, which are generally agreed to be the culmination of an oral tradition which may reach back to the 13th century BC. It is, however, interesting to note that the names of the main actors in the drama – Priam, Hector, Agamemnon, Menelaus, Helen, Cassandra, Odysseus, Penelope – thought of today as among the most famous of “Greek” names, did not continue in use in the Archaic and Classical periods. They enjoyed a revival under the Roman empire, especially outside

Greece, in Italy and in parts of Asia Minor.

Greek naming conformed to the Indo-European pattern found throughout most of Europe until relatively recent times, by which a child received one given name. In public contexts, and for legal purposes, the given name was followed by the name of the father (patronymic), very rarely by that of the mother (metronymic). In certain circumstances, an indication of citizenship (ethnic) would also be given. These three elements – given name, patronymic, and ethnic – are the fundamental elements of nomenclature. The last two are also the building blocks of a much later development, family names or surnames.

In antiquity, as today, there was a tradition of naming the firstborn son after the paternal grandfather, and the second after the maternal grandfather (there is less ancient evidence for the naming of daughters). In leading families whose tenure of public office is recorded, it is sometimes possible to trace this pattern over two or three hundred years. Conservatism in name-giving ensured the preservation of names even after the concepts embodied in them had passed away, sometimes against the tide of new forces.

The patronymic generally took the form of the father's name in the genitive case (thus, Alexandros Philippou); but in areas of the Aeolic dialect (especially Lesbos and the facing coast of Asia Minor, and Thessaly and Boeotia on the mainland) the patronymic adjective was used (and applied to wives as well as children), formed by making an adjective out of the father's name. This usage was common in Homer (e.g. Ajax Telamonios, Ajax the son of Telamon); a second form found in Homer, in which the father's name is given a termination with patronymic force *-ides* (Hector Priamides, Hector son of Priam), survived in the historical period, for example Simonides and Bacchylides, but as an independent form deprived of patronymic force.

While the patronymic was important in identifying and sometimes legitimizing the individual, its use varied according to place and context. The 2nd-century AD writer Pausanias (2. 7) commented that the citizens of Sicyon in the Peloponnese recorded on their tombstones the name but not the patronymic of the deceased. From this statement it might be inferred that the use of the patronymic was standard everywhere else, but tombstones, which survive in their thousands, show that in most parts of western Greece and in Boeotia the patronymic was not generally recorded, while in nearby Thessaly it usually was.

Use of the ethnic also varied, according to context. The purpose of nomenclature is to identify, and at home an individual did not need to indicate origin. The city or regional ethnic was, therefore, used only

when abroad. By contrast, in a city with an internal political organization of demes, such as Athens, Rhodes, or Eretria in Euboea, the demotic was given. At Athens, in the late 6th century, Cleisthenes' reforms required that the demotic should replace the patronymic (*Athenaion Politeia*, 11. 4), but by the 4th century it had become standard practice to give both. Thus, at Athens, "Alcibiades son of Cleinias, of the deme Scambonidai", abroad "Alcibiades son of Cleinias, of Athens".

The Greek grammarians knew two ways of classifying names. They were either "simple" or "compound" in formation, and, as to content, they were either based on the names of gods, "theophoric", or they were secular.

Simple names consisted of a noun or adjective, alone or with a suffix: for example, from the adjective *aristos* ("excellent", "best"), the names Aristos, Arist-ion, Arist-ullos, etc., feminine Arista, Aristo, Arist-ulla, etc. Compound names were formed by combining nouns, adjectives, verbs, or adverbs in various patterns. Thus, Aristo-teles, Arist-ippos, Aristo-kles, Aristo-boulos, Aristo-damos. The order could be reversed: Aristo-nikos or Nik-aristos. Compounds were often turned into a so-called "hypocoristic" form which could be shorter (for example, Kleommas from Kleomachos) or longer (Sophroniskos from Sophron). Women's names could take neuter as well as feminine terminations, and covered broadly the same range of form and content as men's, including military and political connotations, for example Alexandra, Stratippa, Demostrata. Abstract names such as Harmonia ("harmony"), Eukarpia ("fertility"), Glukera ("sweet") did exist, but seem to have originated as slave names.

Within these broad rules, the Greeks showed almost limitless inventiveness; some components, such as *polis* ("city") appear in more than 50 different forms. The following are just a few examples: parts of the body (*kephalos* "head", making Kephalos, Kephal-ion), animals (*leon*, "lion", making Leon, feminine Leaina, Leont-iskos, Aristo-leon; *hippos*, "horse", making Hippo-stratos, Strat-ippos, Hippo-krates, Krat-ippos, Filippos), plants (*ampelos*, "vine", making Ampelos, Ampel-ion, Ampel-ides), political institutions (*demos*, "sovereign people", making Demo-sthenes, Demo-stratos, Arche-demos, Dem-archos), defence or protection (the verb *alexo* making Alex-andros, Alexi-demos, Alexi-polis). Though usually laudatory, attributes could also be (at least to us) pejorative, and yet were passed down from generation to generation: thus, *aischros*, "ugly", making Aischr-ion, Aischr-a, *gaster*, "stomach", making Gastron.

Theophoric names could take the adjectival or the compound form. The most common of all Greek names were the adjectival forms based on Apollo (Apollonios), Dionysos (Dionysios), and Demeter

(Demetrios); but a greater range was provided by compounds in which the name of the god was followed by *-genes/geneia* (birth), *-dotos/dota* and *-doros/dora* (giving/gift), *-philos/phila* (loved/loving), *-kles/kleia* (renown), *-phanes/phaneia* (manifestation), etc. Thus, from Zeus, root Dio-, Dio-genes/Dio-geneia, Dio-dotos, Dio-doros, Dio-philos Dio-kles/Dio-kleia, etc.

Theophoric names could be formed from cult titles of gods, and from lesser deities such as nymphs and river gods; the river Asopus in Boeotia, for example, gave rise to names such as Asop-ios and Asopodoros, which are found only in Boeotia and Athens. There was also the generic type from *theos* ("god"): Theo-genes, Theo-dotos, Theo-doros, Theo-kles, etc. The arrival of new divinities was duly marked in nomenclature; thus, from the late 4th century BC, worship of the Egyptian goddess Isis gave rise to Isi-doros, Isi-dotos, Isi-genes, etc., that of the god Sarapis (later spelling Serapis) to Sarap-ion, Sarap-ias, Sarap-is, etc.

The first major disturbance to the pattern of Greek nomenclature came with the arrival of the Romans who had a wholly different system of nomenclature, with three names, *praenomen*, *nomen*, and *cognomen*. After the Romans conquered Greece, Greeks receiving Roman citizenship would adopt the *praenomen* and *nomen* of the donor (a conquering general, later the emperor or a governor); in this way, names like Julius and Flavius first made their way into Greek nomenclature. The third name, the *cognomen*, was usually Greek: thus, Tiberius Julius Alexander, Titus Flavius Alcibiades. The Romans indicated filiation in a brief formula which came between the *nomen* and the *cognomen*: for example, G(aius) Julius G(aii) f(ilius) Caesar. Greeks sometimes adopted this system, but often simply appended the patronymic to the *cognomen*. A new name-form developed, especially in Asia Minor, with the suffix *-ianus* (e.g. Herodianus from Herodes) which sometimes gave the name a patronymic force.

Christianity was destined to make a permanent impact on Greek nomenclature, but the change was neither sudden nor simple. Several different currents fed into the main stream. Some "Christian" names were in fact Jewish, for example John (Joannes), Anna, and Maria. In time, but not much before the 4th century, names incorporating new values appeared, such as Eusebius and Euphemia. Of the old names, the neutral theophoric names such as Theodora and Theophilos were retained, and some new compounds formed which had not occurred before, such as Theo-doulos (slave or servant of God), comparable to Christo-doulos (servant of Christ). More potent factors were at work, however. The appeal to parents by the 4th-century writer John Chrysostom to name their children after saints and not ancestors is a reminder of the inherent conservatism of naming, but also a

background for the renewal of old pagan names with a new authority. Saints and martyrs were as likely as not to bear “pagan” names such as Demetrius, Dionysia, and Alexandra.

During and after the struggle between Christianity and paganism, Roman names, by now absorbed into Greek nomenclature, continued in general use. After AD 212, when citizenship was granted to all free inhabitants of the empire, Aurelius was the normal *nomen*; after the reign of Constantine (whose own name became a common “Christian” name after his conversion to Christianity), it was Flavius. In the correspondence of Libanius, in the 4th century, the names of recipients show a mixture of Roman names such as Marcus, Proclus, Modestus, Priscianus, and Ioulianus; old Greek names such as Andronikos, Alexandros, Dionysios, and Leontios; and a certain number of distinctly Christian names such as Eusebius, Eustathius, Euphemius, and Ambrosius. A century later, in the correspondence of the Christian Isidorus of Pelusium, Christian names such as Eulogius, Eulampius, Cyrillus, and Serenus account for a greater proportion, but there are also surprising survivals such as Isidorus, Serapion, and Apollonius. Overall, by this period, a general simplification in nomenclature had taken place, the patronymic had largely disappeared, and the ethnic fallen into disuse.

Oracles

Oracles were both utterances of (usually) gods, with or without an intermediary and in response to human questions, and the places where such utterances were made. At reputedly the oldest Greek oracular site, that of Zeus at Dodona in Epirus, the god was believed to make his response known through the rustling of the leaves of a sacred (probably Valonia) oak or the cooing of a dove (probably a ring-dove) perched there, which signs were interpreted by priests. By the 5th century BC, however, priest-esses (later at least called “Doves”) under the inspiration of Zeus simply gave affirmative or negative responses to questions scratched by enquirers on lead tablets, of which about 80 still survive (the most legible is in the museum at nearby Ioannina).

Far more is known about the oracle of Apollo at Delphi, which probably originated in the late 9th century BC (references to an earlier oracle of another deity on the site are subject to much modern debate). After a possible stage when its oracles, similarly to those at Dodona, merely involved interpretations of the rustling of the leaves of a laurel tree, already at the beginning of the Archaic age a local woman known as the Pythia was believed to act in a trance as Apollo’s mouthpiece.

The procedure was as follows. Originally just once a year (according to Plutarch, *Moralia*, 292e), on Apollo’s birthday, but from perhaps the 6th century BC on the seventh day of every month (except for the three months of winter when Apollo was believed to be among the Hyperboreans), consultation could take place, provided that the ominous behaviour of a goat sprinkled with cold water was favourable. Authorities (the Delphic Amphictiony) gave precedence first to Delphians and then favoured states and individuals. This was presumably often won by such costly gifts (most notably by the Lydian king Croesus) that some states even built treasuries at Delphi to house them (the best-preserved today is that of the Athenians). All enquirers had first to place on an altar an inordinately expensive cake (*pelanos*) as fee. Accompanied by the resident representative of his city (*proxenos*), the enquirer passed over the threshold of the temple, made blood-sacrifices, and entered the inner sanctuary, where he kept

silence as a priest (*prophetes*) put the previously supplied question to the unseen Pythia, who was seated upon a tripod, and converted her response into intelligible, though often ambiguous, hexameters. The geology of the site and toxicology respectively prove untenable the ancient reports that the Pythia's trance was induced by mephitic vapours emanating from a chasm or by the properties of laurel leaves: it was probably merely self-induced by an uneducated and pious old woman of great religious susceptibility. The *prophetes*, we may assume, formulated responses on the bases of common sense, the desires of the enquirers, and Delphic interests (although the "Medizing of Apollo" during the Persian Wars has been much exaggerated, the oracle did later fall under the influence of both Philip of Macedon and the Aetolian League). A much cheaper and more common form of oracle at Delphi, and one that came to be practised on other days of the month, was cleromancy, by which one of two presumably differently coloured beans was drawn to give an answer of "yes" or "no".

Despite rivals, most notably the oracles of Zeus at Dodona and, from the 5th century BC, Ammon at Siwa in the Egyptian desert, the most famous oracle in the Archaic and Classical ages was that at Delphi. Although the vast majority of consultants were individuals, it played also a prominent political role (Sparta even maintained a standing commission of ambassadors called Pythii to transact Delphic business). Some evidence suggests that in early times it was consulted over the removal of unpopular rulers, but later it was never involved in internal politics. Although its public importance became most apparent in the belief of virtually all states that Apollo's approval was essential in the planting of colonies, it also both pronounced on the advisability of waging war and was involved in arbitration between states. In the 4th century BC, however, most public consultations were on cultic matters, and even these became rare after c.300 BC. In the Hellenistic period its functions were largely lost in the revival of local oracles, especially those of Asia Minor. Quintus Fabius Pictor enquired of Delphi in 216 BC about the proper rituals for ensuring victory over the Carthaginians, but after the Punic Wars the Romans usually had sufficient confidence in their own abilities to dispense with Greek oracular aid including Delphi's.

Other oracles offered a considerable variety in consultative practices, including the use of male spokesmen for the god, such as the *thespiodos* of Apollo's shrine at Claros in Asia Minor who drank from a sacred spring. At some sanctuaries priests interpreted "divine" signs such as those apparent in the flames (empyromancy) on Zeus' altar at Olympia. There were also oracles that dispensed with intermediaries, often giving their answers by lot (as with the beans at

Delphi) and even dice but most notably by means of incubation, which was practised most commonly by those suffering from disease, insanity, or injury. In this, during a ritual sleep at a sanctuary, consultants were believed either to be healed by a god (often Asclepius) with or without divine helpers or sent a dream that prescribed treatment (Aristophanes describes in detail one such night at the Asclepieum in the Piraeus at *Plutus*, 653–747). Physicians were frequently in attendance subsequently to effect the cure. A bizarre, unmediated but non-medical parallel is afforded by the oracle of Trophonius at Lebadea in western Boeotia. Here the enquirer, after lengthy and elaborate preliminaries, had to thrust himself into a claustrophobic subterranean pit, where the chthonic deity made revelations to him and whence he emerged terrified and barely conscious to be questioned by priests and restored to sanity by relations (graphically described by Pausanias, 9. 39. 5–14).

Although Plutarch (d. after AD 120), himself a priest at Delphi for the last 30 years of his life, wrote on the decline of oracles (*De Defectu Oraculorum*, *Moralia* 409e–438e), inscriptions from the 2nd and 3rd centuries AD on the building of the oracle of Apollo at Claras prove its continued popularity for public consultations by neighbouring states. During this period too various charlatans sought to exploit human gullibility by oracle-mongering. The most notorious of these was Alexander of Abonuteichos in Paphlagonia, whose tricks, involving a live snake apparently attached to a lifelike artificial head (whose jaws he could manipulate) and a hot needle to remove the wax seals of consultants' written questions, are hilariously excoriated by Lucian (*Alexander* or *False Prophet*).

Some well-established pagan oracles certainly survived into the early Byzantine period (the emperor Julian consulted several, including Delphi and Dodona, before embarking on his war against the Sassanian Persians). However, their anti-Christian utterances, many of which had been collected by the Neoplatonist Porphyry in his lost *On the Philosophy of the Oracles*, hastened their suppression. Christians associated them with demons and witches, built churches on their sites, and even forged oracles, such as one of Apollo confessing that his temple at Cyzicus was now the home of the Theotokos. Although Constantine I closed the Asclepieum at Aegae in Cilicia, pagan incubation survived into the 5th century AD, and the practice itself continued throughout the Byzantine period (and has not completely died out today), Christian saints simply supplanting the older gods.

During their heyday the authority of oracles was such that no certain case of disobedience is known. Even among philosophers only the Epicureans denied their claims. Nevertheless, since typically an

oracle did not initiate action but either merely expressed approval or disapproval or chose between alternatives put to it by consultants, it could be manipulated into giving apparent blessing to a dubious enterprise. Even the pious Xenophon was chided by Socrates for asking Apollo to which gods he should sacrifice before setting out as a mercenary on the expedition of Cyrus instead of enquiring if he should join it at all (*Anabasis*, 3. 1. 5–7). Bribery was also practised, but not as often as ancient authorities claim.

Collections of oracles had less authority except in the case of the most famous, the Sibylline oracles. Originally a single prophetess, the word sibyl (probably not Hellenic and therefore suggesting the existence of pre-Greek prophetesses) had become at least by the 4th century BC a generic term for such women throughout the Greek world and later beyond. They were believed to prophesy in the normal manner either under the influence of a god (Apollo for Virgil's sibyl in *Aeneid* 6) or through their own inspiration. Collections are first heard of in connection with the books offered to Tarquinius Priscus (traditionally king of Rome 616–579 BC), the last three of which he bought and had preserved in his new temple of Capitoline Jupiter. Upon its destruction in 83 BC a collection was made from scattered copies, and this was still being consulted as late as AD 363. The surviving Sibylline oracles, in Greek hexameters, date from the 2nd century BC to the 7th century AD and are of mainly Jewish origin with some pagan and some Christian material, which last claims the Sybil as an independent witness to the Christian faith, supports Christian morality, attacks paganism, and prophesies the suppression of certain pagan cults.

The Chaldaean oracles, again written in hexameters and surviving only in fragments, were traditionally ascribed to a father and son named Julian in the 2nd century AD. These offered a philosophical guide to how in a dualistic world believers might empty themselves of evil matter to ascend to a triune deity consisting of a monadic Paternal Intellect, a dyadic Second Intellect, and the Cosmic Soul, which was identified as Hecate. They were much used by the Neoplatonists (especially Porphyry and Iamblichus), fascinated Psellos in the 11th century and were known to Plethon in the 15th.

Oral Tradition

Oral tradition, since it is by definition not fixed by writing or recording, is continually in a state of change: rather like language itself, it is transmitted from person to person and created afresh in the course of every such transmission. There are two indirect routes to knowledge of oral tradition before our own day. The first is by way of authors who explicitly record tales or literature that reached them by word of mouth, or who depict the performance of oral texts. The second is by way of literature that we may judge for stylistic or comparative reasons to have oral origins.

Thus, although the oral literature and history of early Greece are unknowable to us by any direct means – we can have no real evidence that precedes the first written texts, those of Hesiod, Homer, and Archilochus – all three of these still have much to tell us, indirectly, of the oral literary milieu from which they evidently derive.

Hesiod tells us (*Works and Days*) of his victory in a poetry competition in the course of funeral games; it has been supposed that the *Theogony*, his other surviving genuine work, was the winning poem. Evidently other winning poems, in other similar competitions, were not necessarily written down. It has also been hypothesized that the Homeric poems were composed for competitive performance of a similar kind. Hesiod describes the origin of his poetic inspiration as a gift by the Muses; this is typical of the solutions offered by oral poets for the difficult question why some people are able to compose long narrative poems while others are not. His livelihood as a farmer – if we accept the autobiographical framework of *Works and Days* as true

to life – is by no means unusual for epic poets in other cultures.

The two great Homeric epics say nothing at all about their own origin, except for brief invocations of a “goddess” or Muse. It was traditionally held, in later Greece, that they were composed for oral performance. Many have thought that the repeated scenes in the *Odyssey* in which singers perform at feasts are depictions of how the two epics themselves were performed. The use of stylized and repetitious formulas throughout these epics was imitated, with varying accuracy, by later authors of Greek and Latin literary epics, but it was viewed as little more than a curious quirk of the Homeric style until, in the 1930s, Milman Parry showed that these formulas were the building blocks with which long oral narrative poetry is typically, and necessarily, composed.

Parry’s demonstration drew on his fieldwork among the oral epic poets of modern Bosnia. Equally important for those who wish to use the Homeric poems as historical sources was the evidence gathered by Parry and his co-worker, Albert Lord, demonstrating the rapid transformation of epic poems in the course of successive performances. It has been gradually accepted that poems recorded in the 8th century BC (or the 7th, as many now believe) could scarcely retain any accurate and identifiable historical detail concerning events of around 1200 BC, the traditional dating of the fall of Troy. The language and the social background would also predominantly reflect the period at which the epics were recorded.

In 5th- and 4th-century BC Greece the *Iliad* and *Odyssey* had become classics, learned by heart by many schoolboys. There were professional reciters whose business was to perform Homer; the main character of Plato’s *Ion* is in this trade. Traditions of that kind can continue for a long time: the Sanskrit poems of the *Rig Veda* were transmitted similarly for many hundreds of years. In its fundamental aims, of accurate recitation and literal transmission, such a tradition differs entirely from those in which oral epics were originally composed.

The earliest non-epic Greek poetry now surviving is that of Archilochus. His iambic poems, and those of Hipponax, belong to a tradition of ritualized insult and obscenity that is not visible in the Homeric poems but for which there is some independent evidence from Classical Greece.

The Homeric poems do depict oral performances in various lyric genres that were soon to turn into written literature. The mythological and praise poetry of athletic games and banquets, as described in the *Odyssey*, may seem closer in style and occasion to that of Simonides and Pindar than to that of Homer himself. Wedding songs, depicted in the *Iliad*, are recorded in writing from Sappho onwards. Funeral

laments are also described in the *Iliad* and *Odyssey*, and these have been a major genre of Greek oral poetry at many later periods. Working songs, too, have remained a feature of oral tradition: some later ones, such as the Rhodian “Swallow song”, are directly recorded in Classical texts.

Thus, between 700 and 550 BC many poetic genres were turned over to literary composition and written transmission. In the 5th century BC prose was to follow. The sources of Herodotus’ information, and of Thucydides’, were almost wholly oral, the reliability of their narratives naturally varying – as oral tradition generally does – with the length of the period over which the information had been transmitted. History, from this point onwards, was written; records of local and genealogical history, in particular, help to show us how much had until then depended on oral transmission and collective memory. What of the stories of the gods? Greek mythological storytelling, although serving as a source for Hesiod, Homer, Pindar, and many other poets, may always have existed as a prose genre and as such remained essentially oral. Its wealth, even in Roman times, can be judged from the rich records of local mythology gathered by the scholar Pausanias of the 2nd century AD. A storyteller depicted in Longus’ *Daphnis and Chloe*, a novel of about the same date, told an apposite mythological tale to the two lovers, and was rewarded for it (generously!) with a kid.

Orchomenus

City in Boeotia

Orchomenus, cited by Homer as a paradigm of a wealthy city (*Iliad*, 9. 381), is often qualified as Minyan. The eponym Minyas is a shadowy, almost non-existent figure, but the place was real enough, and its reputation justified, at least in the Mycenaean period.

Situated in the northwest corner of the Copais, Orchomenus dominated the whole of this quadrant of Boeotia. Settlement was more or less constant from the Neolithic period. The most striking surviving monument is the Mycenaean tholos tomb (14 m in diameter) called the Treasury of Minyas. Also from the Mycenaean period isolated finds of pottery and fresco fragments have been found on the lower slope of the hill into which the tholos tomb was set. From the area of the convent east of the tomb have come numerous wall painting fragments. The economy of Mycenaean Orchomenus seems to have depended on crops grown in the Copaic basin. The Mycenaean – like their British successors of the 19th century AD – constructed a system of hydraulic works to control the waters flowing into the basin in order to render the larger part of it free for cultivation. The canals were directed to a number of swallow holes – *katavothrai* – on the eastern shore and in the northeast corner of the Copais, which was protected there by the island fortress of Gla, which was both a control point – since the northeast bay of the Copais is the only part of the basin not visible from Orchomenus – and a refuge. Gla was abandoned at the end of Late Helladic IIIB. This suggests that the drainage works of Minyan Orchomenus were no longer functioning, the bureaucracy which maintained them having broken down. Nothing is known about relations between Mycenaean Thebes and Mycenaean Orchomenus: the legends concerning the war between Orchomenus and Thebes are more likely to reflect events during the 6th century BC than those of the Bronze Age.

In Archaic Boeotia there were still two major spheres of influence, one around the western half of the Copais under Orchomenus, the other covering the rest of the territory and more loosely tied, with no obvious dominant state. The power and influence of Orchomenus in the Archaic period may be reflected in the tradition that Orchomenus was a member of the Calaurian Amphictiony. This association was based at a sanctuary of Poseidon on the island of Calauria (Poros) in the Saronic Gulf, for which evidence goes back to the 7th century BC.

Eventually, Orchomenus, as it tried to extend its control to the east, and Thebes, moving westward, ran into each other, the result being the confirmation of Theban supremacy over the rest of Boeotia. This was assured by the fourth quarter of the 6th century, and is reflected not only in the literary traditions, but in contemporary inscriptions.

However, the new Boeotian League which emerged towards the end of the 6th century under the leadership of Thebes was by no means an autocratic association. One sign of this is the appearance late in the century of a distinctive Boeotian coinage, which means that there was not only an accepted common standard, but also a common economic policy. That the policy was consensual is shown by the facts that not only Thebes but at least nine other member states had their own mints, and that Orchomenus, although reduced, was allowed to issue its own small denomination coinage with a distinctive symbol of grain(s) of corn on the obverse, rather than the otherwise general Boeotian shield.

During the Persian invasion of 480/79 BC, Orchomenus joined Thebes and most of the rest of Boeotia in Medizing. In the period after the Battles of Tanagra and Oenophyta (456 BC), when Athens dominated Boeotian affairs, Orchomenus may have been a member of the Delian League, but by 446 it had become a place of refuge for disaffected Boeotians of the oligarchic persuasion, who eventually defeated an Athenian force at nearby Coronea and threw the Athenians out of Boeotia.

Orchomenians fought on the left wing in the victorious battle of Delion (424), but it appears that, as the 5th century drew to its close, Orchomenus was being gradually stripped of its power and influence, with Thebes growing progressively more dominant within the Boeotian League. By the end of the century Orchomenus had lost control of Chaeronea and Lebadea, and was contributing only two of the 11 federal Boiotarchs.

It is not surprising that Orchomenus became a centre for anti-Theban sentiment. During the Corinthian war (which began in 395) it seceded to Sparta, and was protected by a Spartan garrison until at least 375. After the King's Peace (387/ 86 BC) Orchomenus, like the other poleis of Boeotia, formally regained its independence.

After the expulsion of the Spartan garrison from Thebes in 379/78, the Thebans gradually re-established themselves as the dominant power of Boeotia, and confirmed their status at the battle of Leuctra (371 BC). The Theban-led Boeotian League established the Basileia, games in honour of Zeus Basileus at Lebadea, which had formerly been dependent on Orchomenus. This Zeus was the original patron deity of Orchomenus, and the location of his sanctuary on the hill of Profitis Elias was an open provocation to the Orchomenians, and a

public proclamation to all who passed by – since the hill is clearly visible from the road to Delphi – of the political pretensions of the Boiotoi, that is, the Thebans. The Thebans went even further, and in 364 razed Orchomenus.

This destruction was not permanent, as Theban power waned after the death of Epaminondas, and hostility between Thebes and Phocis drew closer to open warfare. Orchomenus was functioning again as early as 359 BC, and during the Third Sacred War it was mostly in the hands of the Phocians. But at the end of this war (346 BC) Philip II of Macedon handed Orchomenus back to Thebes, when it seems to have been destroyed and the population dispersed.

However, after Chaeronea (338), Philip restored the city, and Alexander the Great even commissioned an engineer (Crates) to drain the Copais, but this enterprise was not completed, and Orchomenus never really recovered its former stature. During the Hellenistic period it fell upon bad times, was compelled to borrow money – which it had difficulty repaying – and relied increasingly on the generosity of individual citizens for its public operations. It is clear that under the Romans Orchomenus had shrunk to the status of a village, which indeed it has remained until relatively recently.

After antiquity, settlement persisted at the foot of the hill Akontion, focusing on the villages of Skripou and Petromagoula (now joined into one and called Orchomenus). The outstanding monument surviving from this period is the church of the former convent of the Koimisis tis Theotokou (ad 874), one of the earliest cruciform churches in Greece. Its builders used blocks from an ancient temple and the nearby theatre (4th–3rd centuries BC).

Aside from the tholos tomb, theatre, and church, the most impressive remains are traces of city walls on the Akontion hill and, on the acropolis proper, fortifications built by the Macedonians late in the 4th century BC. No certain trace has been found of a Mycenaean palace, or of the sanctuary of the Charites – the Graces – whose cult Pindar mentions in *Olympian* 14, nor of the supposed tomb of Hesiod.

Orgiastic Cults

The term *orgia* designated certain ceremonies and religious rites, with particular reference to initiation into a specific cult. Usually there were secret rites that had a symbolic function. The term “mystery” is also used. As Walter Burkert remarks, ancient mysteries were a kind of personal religion, since the initiation depended upon a person’s decision to participate in a cult, and its practice enforced hope and belief in prosperity and future life. Such cults usually consisted of a variety of activities, such as purifications, processions, sacrifices, and dramatic enactments. The word mystery (*mysterion* in Greek) comes from the verb *myein*, meaning “to close”. The *mystai*, those who participated, were required to keep their mouth closed and not to reveal secrets to those who had not been initiated. The word “orgiastic” in its modern sense probably best describes certain cults, particularly towards the end of the Hellenistic time, when a fusion of religions from various origins took place. The most important cults of this kind were Eleusinia, Thesmophoria, Dionysia, Orphica, Cabeiria, and mysteries for the worship of Cybele, Isis, and Sabazius.

The general idea of passing beyond the limits of morality in as many directions as possible lies behind the existence and performance of many orgiastic cults. Moreover, the psychological need to ritualize all possible polarities of human nature, so as not to be excluded from a community but rather belong to one, is another factor that explains the wide reception they had in antiquity. Herodotus (8. 65) speaks of 30,000 people attending mysteries. The roots of many orgiastic cults are hidden in the mists of prehistory, since they developed from rural festivals that celebrated the power of nature and fertility. The notions of death and resurrection are associated with many principal figures of the mysteries, for example, Dionysus, Persephone, Adonis, Attis, Osiris, and the Mithraic bull.

The Eleusinia were a mystic cult centred around the myth of the rape of Persephone, daughter of Demeter, by Hades, and the search of the mother for her daughter. The explanation of the natural phenomena and the human hope for rich agricultural production and fertility were treated in a symbolic manner. A series of purification rites took place. Many citizens of Athens were initiated in these mysteries, and although there is some uncertainty as to what went on, there are plenty of literary and archaeological sources to help us reconstruct the image of the Eleusinian mysteries. They continued to

exist throughout the Roman period, until the 4th century AD, when the emperor Theodosius abolished them.

The Dionysiac cults, which had more of an orgiastic character in the modern sense of the word, included much wildness and extravagance. The cult of Dionysus had many festivals, for example, the City and the Rural Dionysia, the Anthesteria, and the Oschophoria. Besides the official celebration in honour of the god, there were also private celebrations that involved ecstatic worshipping of the god and going beyond one's self. The phenomenon of maenadism, as described in Euripides' *Bacchae*, is one example of extravagant rites that, even if they are mythical, still retain the element of self-transcendence that orgiastic cults promoted. Women in a state of ecstasy abandoned their homes and joined frenzied dances on the mountains swinging thyrsi and torches. This cult involved as a sacramental meal the devouring of an animal as it was bleeding. There is evidence of *orgia* of this type on Mount Parnassus by women controlled by Apollo who admitted Dionysus to Delphi and assisted the establishment of his cult in a milder form.

The Orphic cult promised life after death, and was related to oriental and Egyptian ideas of the afterlife. It involved many expiation rites. The worship of Cybele, or the Great Mother, is the result of much religious syncretism. The orgiastic character is strongly associated with her due to the institution of eunuch priests, the self-castrating Galloi. As with the Eleusinian mysteries, there is a mythic narrative corresponding to the ritual practice. Attis, the young lover of the goddess, was castrated and became her follower. Various rites were associated with the worship of Cybele, such as the *taurobolia* (slaughter of a bull) and *kriobolia* (sacrifice of a ram), perhaps dating from the 2nd century AD, when the initiate had to be drenched in the blood of a sacrificed bull or ram.

The Cabeiria was a mystery cult that took place in Samo-thrace and acquired importance second only to the Eleusinian mysteries. Ancient writers talk about the cult of the "Great Gods" in Samothrace. It is possible that the Great Mother of the Gods as well as Hecate and a certain Zerynthia Aphrodite were worshipped in Samothrace. Archaeology reveals that the shrines were active until the 3rd and possibly 4th century AD. As at Eleusis, the two important stages were those of preparation and initiation. But whereas in the Eleusinian mysteries one had to wait for at least a year between the two, in Samothrace they could be achieved on the same day. All the initiation rites occurred at night. The most important buildings found are the Anaktoron, where the initiation took place, built in the 1st century BC (but replacing an earlier structure), the Hieria Oikia (sacristy) where all the preparations were made, the Arsinoeion, built between 289 and

281 BC by Arsinoe, the wife of Lysimachus, a place for sacrifices and gatherings, and the actual shrine (Hieron). Many votive offerings have been excavated as at Eleusis, and it is possible to see the ruins of a theatre.

Cults associated with foreign gods such as Mithras, Serapis, and Isis were important in Greek religious life until late antiquity. Orgiastic cults continued to exist even after pagan times and within Christianity, and some blended into Christian ceremonies, although there was conscious opposition, particularly by Church Fathers. After the establishment of Christianity, many of the places that were important for ancient mysteries were destroyed, as happened at Samothrace.

Origen AD 184/85–254/55

Christian writer

As a native of Alexandria, Origen encountered the thought of Philo and the Valentinian “Gnostics”, though he does not admit to learning much from either. He may have succeeded Clement as the head of the Catechetical school, and one of his works, the lost *Stromateis*, derived its title from his predecessor. He also found time to study with a teacher of Greek philosophy named Ammonius. This may be the same Ammonius who taught the Neoplatonist Plotinus, but those who identify the Christian Origen with Plotinus’ fellow pupil of that name are merely cherishing an indifference to the facts. Origen’s talents earned him first the patronage, then the enmity, of bishop Demetrius of Alexandria, and he migrated from the province to Caesarea, where his friends conferred on him the rank of presbyter. The breach with Alexandria was now irreparable, but in Caesarea Origen became an indefatigable teacher and a celebrated author, enjoying both the friendship of an empress and the general admiration of the Church.

Origen was the earliest Christian writer to make use of the Old Testament in Hebrew rather than Greek. The six columns of his

Hexapla contained the Hebrew text, a transliteration of this into Greek characters, the Septuagint, and the later Greek translations or revisions made by Symmachus, Aquila, and Theodotion. Since he maintained the authority of the Septuagint against well-founded criticism, his object was more probably to establish the text of this than to replace it with a more accurate translation. Nevertheless, having had a “Hebrew” teacher, he acknowledged the Jewish canon (Eusebius, *Historia Ecclesiastica*, 6. 25), and his commentaries and homilies, which cover most of this and our New Testament, did not extend to the Apocrypha. The purpose of his exegetic writings was to bring every part of the Bible home to the thoughts and lives of his contemporaries; whereas his heretical precursors had appealed to uncanonical gospels, he applied the tools of allegory to the scriptures, introducing a distinction between the body, soul, and spirit of the text (*De Principiis*, 4. 2. 4 etc.). He argued that the spiritual sense was present everywhere, and might sometimes be the only one, as in the Song of Songs; but the bodily or literal sense was not discarded except when it appeared to condone absurdities, immoralities, or defections from the apostolic faith.

This faith he upheld at the greatest length in his eight books against the dead philosopher Celsus; they presented Christianity both as the heir of Judaism and as the philosophical antidote to the errors, pains, and vices of the world. This work, perhaps composed to mark the thousandth anniversary of Rome in 248, is largely orthodox, but in his earlier *De Principiis* (On First Principles), the first Christian experiment in systematic theology, he allowed himself more freedom in speculation. He appears to have held, for example, that our souls lived in a higher state with God before they descended into this world, where they must undergo a purifying chastisement for their sins (*De Principiis*, 1. 4 etc.). This process after death will be extended to the body, and, though each must attain perfection in his own time, the whole created order will eventually be saved (*De Principiis*, 2. 8–11 etc.). These views, whatever they owe to Platonism, rest on a fundamental tenet of Greek theology, that no one ever suffers more from God than he or she deserves. Equally seminal for Orthodox doctrine was his teaching on the Godhead, for he was the first to say that in this Trinity or triad of three hypostases the Spirit and the Son are coeternal with the Father, though their existence and activity depend upon his will (*De Principiis*, 1. 2, *Commentary on John*, 2. 10, etc.).

Origen undoubtedly saw himself as an exegetic theologian, whose reading of the scriptures was conditioned by the teachings and traditions of the Church. While he is glad from time to time to find a friend in Plato, he never takes a philosophical statement as his starting

point or advances a conjecture that cannot be grounded on some sacred text. He takes it as an axiom that God the Word is present in every sentence of the scriptures (*Philokalia*, 5), and says that in his use of philosophical tools he was “spoiling the Egyptians” to enrich his own understanding (ibid. 13). Even his anthropology could not be independent of his Trinitarian doctrine. The Spirit first converts us by addressing the rational element, next the Son instructs our souls in virtue, and finally the Father gives us everlasting life, wherein the spirit and the soul will be united to the proper kind of body (*De Principiis*, 1. 3. 8 etc.). The germs of the threefold mystical way – the purgative, the illuminative, and the unitive – are discernible in this scheme, but it neglects the body less than many later speculations. The Spirit is our sole guide while our body is still at war with us; when this has been refined by immortality, we can be at last “one Spirit” with the Lord.

Among his disciples Origen numbered Eusebius of Caesarea, who profited greatly by his scholarship, and Gregory of Nyssa, who adopted his universalistic theory of salvation. In Gregory’s time, however, it was already necessary to borrow silently, for Origen stood accused of many heresies: for example, of believing in the transmigration of souls, of denying the resurrection of the body, and of making the second person of the Trinity inferior to the first. His heresies were exposed in the *Ancoratus* and *Panarion* of Epiphanius of Salamis, who seemed disposed to condone the anthropomorphite heresy rather than follow Origen in abandoning the literal sense of scripture. He charged him with denying not only the bodily resurrection, but the fall of man in Adam, and his tract in defence of the Septuagint suggests that he saw an insidious purpose even in the *Hexapla*. Origen was condemned in 553 by the Second Council of Constantinople, and in consequence most of his writings were destroyed. All that survives in Greek is a number of homilies, passages from the *Commentary on Matthew*, the greater part of the *Commentary on John*, the *Contra Celsum*, the treatises *On Prayer* and *To the Martyrs*, the newly discovered *Dialogue with Heraclides*, and the *Philokalia*, a compilation of excerpts made by Basil the Great and Gregory of Nazianzus. We depend on the Latin renderings of Jerome and Rufinus for most of the rest, including the *De Principiis*; but in the West the uncertain status of the Constantinopolitan Council has allowed such theologians as von Balthasar to pay more open tribute to his *Commentary on the Song of Songs*, a seminal work of Christian mysticism. Jerome’s regard for Origen and Rufinus turned to hatred under the spell of Epiphanius, but it was Origen’s example that inspired his Latin translation of the Old Testament from the Hebrew. In eastern Christianity Origen’s influence, where perceptible, is a

testimony to his intellect, his honesty, and the many abiding merits of his work.

MARK EDWARDS

Biography

Born in Alexandria in AD 184 or 185, Origen was educated at the catechetical school under Pantaenus and Clement and learnt philosophy from Ammonius. He may have succeeded Clement as head of the school before moving to Palestine in 215. He wrote extensively about textual criticism, exegesis, and systematic theology and was ordained a priest. Recalled to Alexandria, he was later banished and settled at Caesarea. He died at Tyre in 254 or 255.

Writings

Werke, edited by P. Koetschau et al., Leipzig: de Gruyter, 1899–1941.

Contra Celsum, translated by Henry Chadwick, Cambridge: Cambridge University Press, 1953.

On First Principles: Being Koetschau's Text of the De Principiis, translated by G.W. Butterworth, New York: Harper and Row, 1966.

An Exhortation to Martyrdom, Prayer, First Principles: Book 4, Prologue to the Commentary on the Song of Songs, Homily 27 on Numbers, translated by Rowan A. Greer, London: SPCK, and New York: Paulist Press, 1979.

Treatise on the Passover, and Dialogue with Heraclides, translated by R.J. Daly, New York: Paulist Press, 1992.

Orphism

The term “Orphism” is somewhat ambiguous, as it is not clear exactly what it refers to. The ancients never spoke of Orphism but only about Orpheus, the presumed author of Orphic books, and of certain Orphic rites. A book became Orphic simply by being ascribed to Orpheus. The question of whether Orphism existed as a religious movement or merely as a set of beliefs described in the Orphic literature remains controversial. The rise of Orphic ideas and the nature of Orphic practices remain obscure despite some recent discoveries. The unifying factor, Orpheus, is a mythical figure of Thracian origin whose main characteristic was a unique gift for music. This characteristic features in a number of ancient stories about Orpheus; he is said to have enchanted Hades with his song so that his prematurely dead wife Eurydice returned to life (cf. Plato, *Symposium*, 179d); to have taken part in the Argonauts’ expedition and outsung the Sirens (cf. Pindar, *Pythian* 4. 167f.); and to have been beheaded by Thracian women while his head continued to sing (*Symposium*, 179d, *Republic*, 620a).

Through his achievements Orpheus appears as a great shaman – somebody whose spirit can affect the whole of nature, from plants and animals to souls and even gods or Hades. These achievements are often the subject of the Orphic poems, usually hymns or longer poems of theogonic or cosmogonic content, most of them now lost or only partially preserved. Such Orphic poems presumably started to circulate from the 6th century BC and they became popular in 5th and 4th centuries BC, as the testimony of various authorities suggests (e.g. Euripides, *Hippolytus*, 952ff.; Plato, *Republic*, 364e, *Cratylus*, 402b, *Philebus*, 66c, *Laws*, 829e). A relatively recent find, the Derveni papyrus, discovered in a tomb in northern Greece and dating from the late 4th century BC, contains a commentary on an Orphic theogony and proves that such Orphic poems were in circulation already in the 5th century BC. In the 6th century AD Damascius (*De Principiis*, 123–24), discussing the Orphic account of the beginnings of the world, talks of three Orphic theogonies, of which he had only indirect knowledge. According to the core of Orphic cosmogony Chronos, the primordial divinity, gives birth to Aether and Chaos and they generate a world-egg.

The link between these poems and a cult of Orpheus is difficult to determine. The Derveni papyrus, buried and burned with an unknown Greek, makes even clearer the close linking of religious practices to a specific text. Orphism seems to have been very much a book religion. Plato talks of purveyors of purifications and rituals which bring deliverance from unrighteousness, claiming that these people perform rites in accordance with books by Musaeus and Orpheus (*Republic*, 364e–365a). The most ancient testimony to Orphic practice comes

from Herodotus. With reference to the prejudice against introducing woollen articles into temples or being buried in them, Herodotus says that this is an Egyptian custom and “in this they agree with the practices which are called Orphic and Bacchic, though they are actually Egyptian and Pythagorean” (2. 81). Herodotus is not the only one who identifies Orphic with Bacchic rites. In Euripides’ *Hippolytus* (953) Theseus uses the verb *baccheuein* for Orphic rites. Archaeological evidence further supports the close relation between Orphic and Bacchic rites, and Orpheus often figures in artistic depictions of predominantly Dionysiac themes. Orpheus is sometimes said to be the initiator of the cult of Dionysus (Hecataeus), but at other times he is presented as having neglected the worship of Dionysus after his journey to Hades, instead venerating the sun (Aeschylus, *Bassarai*) for which his punishment was his assassination by a group of Thracian women. We hear of active *Orphikoi* in Athens and in southern Italy in the 5th century BC and we know of their distinctive views (e.g. Aristotle, *De Anima*, 410b28f.), but little is certain about their rites. Ancient sources speak of Orphic rites (*teletai*), though without giving precise information (Aristophanes, *Frogs*, 1032, *Rhesus*, 943; Plato, *Protagoras*, 316d), and also of participants in these rites (*Orpheotelestai*) (e.g. Theophrastus, *Characters*, 16. 11). Presumably the mysteries referred to, at least in some of those occurrences, are the Eleusinian mysteries. In some sources Orpheus is mentioned as their founder (Diodorus Siculus, 1. 23. 2f.), and Orphic mysteries are sometimes identified with the Eleusinian mysteries (Pausanias, 1. 37. 4). Orphic ideas indeed permeated the Eleusinian and also the Theban mysteries of the Cabiri. Orphics were particularly concerned with the purity of the soul, which was deemed to be imprisoned in the body. This purity was sought through an ascetic way of life with strict rules, especially about diet, such as abstinence from meat (Euripides, *Hippolytus*, 952–55; Plato, *Laws*, 782c–83c), but also from eggs, beans, and wine. Orphics believed in an afterlife and the trans-migration of the soul, a feature which brings Orphism closer to Pythagorean ideas rather than to the Eleusinian mysteries. There is a certain common ground between Orphism and Pythagoreanism and perhaps some rivalry between them, to judge from such contradicting testimonies as that according to which Pythagoras and the Pythagoreans were the true authors of Orphic poems and that Pythagoras was indebted to Orpheus.

Orphic literature proliferated in the Hellenistic and the imperial eras. In the religious syncretism of late antiquity the name of Orpheus continued to fascinate, but now there was even less concern for demarcation between Orphic and other religious cults. A significant revival of interest in Orphic literature occurs with the Neoplatonists.

Orpheus was now not only an inspired poet but also a theologian. The Orphic poems were interpreted allegorically and, under this interpretation, were held to be in accord with the doctrines of Platonic philosophy. The Orpheus legend had a considerable impact on Christianity. Although the Orphic rites were dismissed, the story of Orpheus charming nature with his music was interpreted as a prefiguration of Christ charming human souls with his teaching (Clement, *Protrepticus*, 7. 74. 3–6). Christ in his role of the Good Shepherd is said to be the new Orpheus (Eusebius, *Laus Constantini*, 244. 14–31). The figure of Orpheus which is often found in catacombs stands for Christ, who can also be depicted as Orpheus himself.

Ostracism

One of the most remarkable and at the same time controversial institutions of the Classical Athenian democracy was ostracism, a procedure whereby once a year any citizen (usually a leading politician), could be banished by a vote of the people. The term itself derives from the method of voting, which involved writing the name of the victim on a potsherd (*ostrakon*).

In the sixth prytany of every year the assembly voted by a show of hands whether or not to hold an ostracism; if it decided to do so, the ostracism took place in the Agora during the eighth prytany. The citizens voted by tribes in an enclosure, and if at least 6000 votes were cast, the man who received the highest number was obliged to leave Attica within ten days. He suffered no loss of citizenship (*atimia*) or property rights, but could not return to Athens for a period of ten years. The main ancient account of ostracism is found in the *Athenaion Politeia* (chapter 22), which attributes its introduction to Cleisthenes in 508/07 BC. Both attribution and date have been questioned, since ostracism was not in fact used for another 20 years; and a fragment of Androtion (Jakoby, *Fragmente de griekischen Historiker*, 324 fr.6, in Harpocration s.v. Hipparchus) has been taken to indicate an alternative tradition, that ostracism was introduced shortly before 487. However, the text of Androtion is very uncertain, and the *Athenaion Politeia* version is to be preferred. Later sources, notably Aelian (*Varia Historia*, 13. 24), record that ostracism was originally held in the Boule (council) and that Cleisthenes was himself the first victim of his own procedure, but this third tradition is also to be rejected.

The purpose of ostracism was to end rivalry between politicians that could potentially be harmful to the interests of the state. According to the *Athenaion Politeia*, Cleisthenes' original intention was to prevent future tyrannies, and it was subsequently aimed against those who were too powerful. Its early victims, indeed, were "the friends of the tyrants": Hipparchus son of Charmus (487), a relative of the tyrant Hippias; Cleisthenes' nephew Megacles (486), a member of the Alcmaeonid family that was suspected of attempting to betray Athens to the Persians at the battle of Marathon; and probably Callias son of Cratius (485), another supporter of Hippias. One sherd bearing Callias' name has a drawing of a Persian archer on the reverse. However, it is unlikely that ostracism, even though it was introduced in the aftermath of the fall of the Pisistratid tyranny, was designed specifically as a check on the tyrants, for which more direct and secure action could have been taken, and this seems very much like an inference from the identity of the first victims. Rather, it will have been introduced by Cleisthenes as part of his political struggle against Isagoras.

Later victims of the 480s were also connected with the Persians, at least by the voters: Xanthippus, the father of Pericles (484), had married into the Alcmaeonid family, and one *ostrakon* bears an elegiac couplet possibly associating him with their curse; Aristides (482) appears on another which claims he was a “brother of Datis the Mede”; while other *ostraka* refer to their victims as Alcmaeonids and “one of the traitors”. But both Xanthippus and Aristides were recalled early under an amnesty passed in 480 before the Persian invasion. Other prominent victims of ostracism were Themistocles (c.470), Megacles again (sometime in the 470s; 4647 of the Ceramicus *ostraka* bear his name), Cimon (461), the elder Alcibiades (c.460), and Pericles’ rival, Thucydides son of Melesias (443). The last man to be ostracized was the demagogue Hyperbolus (probably 416); the practice subsequently fell into disuse, though the law remained in force, and was replaced by the *graphe paranomon* (indictment for unconstitutional activity).

Over 10,000 *ostraka* have been found, on the Acropolis, in the Agora, and in the Ceramicus cemetery, and these record the names of over 130 different men. This suggests that there were no lists of candidates; and while those actually exiled will regularly have been ostracized for their political policies, other citizens clearly featured in the voting as a result of personal enmities. Indeed, Plutarch records the occasion when a voter wished to cast his *ostrakon* against Aristides, because he was tired of hearing the latter being called “the Just” (*Aristides*, 7. 7). That this citizen was unable to write the name of his victim is evidence for illiteracy in Classical Athens, although the procedure seems to presuppose widespread literacy. One find, of 191 *ostraka* on the Acropolis with the name of Themistocles, also has a bearing on this question, since they are written in only 14 hands, but furthermore is clear evidence for a concerted campaign against him by political opponents.

The fourth speech in the corpus of Andocides purports to be an oration delivered at an ostracism. The occasion is, however, historically impossible, and it is extremely unlikely that speeches were made on the day of the voting. It is stated in section 6 of this work that ostracism was used only in Athens, but in fact there were similar procedures in other states, including Argos, Megara, and Miletus.

P

Paestum

Greek colony in Campania

Paestum (Poseidonia) was an important Greek colony in Campania in southern Italy and is the site of well-preserved Greek temples. Located about 80 km south of Naples, Paestum is about 700 m from the sea and just south of the Sele river.

The site saw human habitation as far back as the early Stone Age; roving hunters moved through the area, leaving behind tool artifacts. Neolithic farming is evidenced from the archaeo-logical record, and recent excavations have recovered remains from the Bronze Age, e.g. a large graveyard 1.6 km north of the city, and houses in the southern sector of the ancient walls. Sherds of Mycenaean pottery suggest some, though probably indirect, contact with the Greek mainland. In the environs of Paestum 8th- and 7th-century sites have been recovered.

Paestum was founded between 650 and 600 BC by colonists from the Italian city of Sybaris, which was itself a colony established in 720 near Croton on the Ionian Sea by Greeks from Troezen and Achaia. The city was called Poseidonia, or the City of Poseidon. At about the same time, the sanctuary of Hera at Foce del Sele was established about 8.5 km north of Paestum; this sanctuary included a temple, altars, stoas, and a treasury. In the 6th century BC Paestum flourished through trade with the Etruscan cities to the north. Its political importance increased when Etruscan influence waned and the mother city Sybaris was destroyed in 510 BC. Many of the Sybarites fled to Paestum, and this, coupled with the great fertility of the plains and the city's strategic position on the trade routes, caused a further economic boom. Around 400 BC the Italian people called Lucanians descended from the interior mountains and invaded Campania, soon taking over Poseidonia. The city continued to prosper, however, and enjoyed a strong, vibrant industry and commerce. Soon the Lucanians' expansionist policies brought them into conflict with the Greek cities further south, especially Tarentum. The Greeks called upon Alexander, the Molossian king of Epirus and brother-in-law of Alexander the Great, for assistance. Alexander was initially successful, reaching as far north as Paestum where he defeated the Lucanians in 332 BC. The following year, however, Alexander died and Paestum fell again under the rule of the Lucanians. Soon another power appeared on the scene: Rome. Rome gradually became involved in Campania in response to the Greek cities' calls for help against the Lucanians. In 280 BC

Tarentum reacted to this intrusion in their sphere of influence by calling upon Pyrrhus, king of Epirus, for assistance. Pyrrhus was soon defeated, abandoning Italy in 275 BC and thereby allowing Rome to assume control of the whole of southern Italy. Rome established a colony at Poseidonia in 275 and renamed the city Paestum. The city's status became *socius navalis*; this meant that Paestum, although nominally autonomous, supplied Rome with a quota of sailors and transport ships (as opposed to land troops, as in the case of other Italian cities).

Paestum proved very loyal to Rome, even in the darkest times. Throughout the First and Second Carthaginian Wars of the 3rd century BC Paestum's loyalty never wavered – even when much of Campania and all of Lucania defected to Hannibal after the disastrous Roman defeat at the battle of Cannae in 216 BC, and even as Hannibal feasted in the city of Capua, just a few days' march to the north. Paestum also maintained allegiance to Rome during the Social War of 91–88 BC, when many of Rome's allied cities in central and southern Italy revolted in an effort to achieve full Roman citizenship. As a reward for its unswerving loyalty, Paestum retained the right to mint its own coinage until the 1st century AD. Later in that century the emperor Vespasian settled a number of sailors at Paestum.

Paestum's gradual decline began as early as the 2nd century BC. The completion of the great highway, the Appian Way, diverted the major trade route away from the southeast coastal area to the ports on the Adriatic. Even a new local road, the Via Polilia, bypassed Paestum. Despite a somewhat renewed building programme in the 2nd or 3rd century AD, the city suffered malaria epidemics as well as flooding and swamping due to the silting of local rivers. By the 5th century the city had been reduced to a village of houses clustered around the temple of Athena, which by now had been converted to a Christian church. There are records of a bishop residing in the city as late as the 7th century, and an 8th-century basilica was erected. In the 9th century the inhabitants moved to the hills because of constant raids by the Saracens.

Paestum contains some of the best-preserved and most important Greek temples in the ancient world. The city walls, with a perimeter of nearly 5 km, date to the 5th century BC, with renovations done in the subsequent two centuries; 24 round and square towers ring the walls, with four main gates. The Greek city was laid out with two sacred areas in the north and south, separate areas containing public buildings, and houses laid out in gridlike blocks. The south sacred zone contains two magnificent temples, both dedicated to Hera. The so-called "Basilica", dating to c.550 BC, is extremely well preserved. The adjoining, mid-5th-century temple, also dedicated to Hera but

erroneously called in earlier literature the temple of Poseidon, is one of the best examples of Doric architecture. The two temples formed the centre part of a sacred precinct of Hera. The northern sacred area contains the 5th-century temple of Athena (originally thought to have been dedicated to Ceres); its design is radical, being the first Greek temple to incorporate both Ionic and Doric elements. The Greek agora, or marketplace, was situated just south of the Athena precinct, as recent excavations have shown. A circular meeting-house (*bouleuterion*) and an underground shrine flanked this area.

The Roman colonists radically restructured Paestum in accordance with typical Roman city planning. A large forum was mapped out between the two sacred zones, with the *cardo maximus* and *decumanus* roads leading into the forum (the *cardo* even replaced the Sacred Way that had run behind the two Hera temples). The open court of the forum was flanked by such buildings as theatres, markets, baths, an amphitheatre, a gymnasium, and smaller temples.

Paestum is surrounded by important archaeological sites, many of which are still being excavated. Three major necropolises have been located, ranging in date from the 3rd millennium to the 4th century BC. The paintings of early 5th-century BC tombs are important for the history of Greek art. At Santa Venera, 1 km south of the city, a large sanctuary has recently been discovered; dated to the 5th century BC, the complex was dedicated to Aphrodite (not Bona Dea, as once thought).

Paestum is an extremely important city for the study of ancient Greek architecture, south Italian tomb painting, Roman city planning, ancient religion, and pottery and burial customs.

Painting

The origin of Greek painting is difficult to ascertain. Ancient literature is filled with references to famous painters and paintings, but very few paintings survive. Archaeological evidence provides some knowledge of the painter's craft and subject matter. There are specific descriptions by Aristotle, Plutarch, Pliny the Elder, Quintilian, Lucian, Cicero, and Pausanias. They extol the artistic talent of the Greeks, whose art was avidly collected and used to adorn public and sacred buildings. Among ancient painters, the most celebrated were male, yet it was not an exclusionary craft; Pliny names female artists as well. The gradual evolution from painted temple metopes and plaques, stelae, wooden panels, and pottery resulted in painting so illusionistic that horses were said to neigh when confronted with a painted image of another horse.

Antecedents of Greek painting occurred during the Bronze Age cultures of the Minoans and Mycenaeans. Murals on the palace walls of Crete and Thera were partly influenced by Egyptian art, but the subject matter and function appear to be completely different. There is an inherent liveliness and naturalism in the landscapes, figures, and animal motifs. Topics are religious (funerary or sacrificial rituals) or purely decorative. In both cultures marine and floral motifs were depicted on vases. Mycenaean painting is related to Minoan art, with military themes and abstraction becoming evident.

In Greece vase painting arose c.900 BC with the Geometric period. Figures were black silhouettes formed by circles, triangles, and squares. During the Orientalizing phase there was progress in distinguishing musculature and identifying facial characteristics. In Archaic black- and red-figure vase painting males and females are presented in mythological or everyday scenes. Overlapping figures indicate depth. Details are scratched into the dark figures for drapery, hair, and other features. Red-figure painting allowed for greater expressive freedom by using a brush loaded with paint for details rather than a stiff etching tool. From the second half of the 6th century BC artists' signatures are common, the painter writing *egrapsen* ("he drew") after his name.

According to one legend, drawing began in Greece when a woman traced the outline of her lover's shadow on the wall. Ancient writers relate that great achievements in Greek mural and panel painting occurred during the 5th and 4th centuries BC. The use of flat colours

within an outline progressed to forms modelled in light and shade; buildings were depicted in perspective; and figures and objects were illusionistically set into space using cast shadows. The most celebrated painters, who included Polygnotus, Apollodorus, Zeuxis, Parrhasius, Pausias, Nicias, Apelles, and Protogenes, were renowned for their ability to create *trompe-l'oeil* effects on flat surfaces. Many paintings were on panels that could be transported to cities and art markets, thus spreading the fame and fortune of the artists.

In the early Classical period Polygnotus from Thasos was regarded as the “inventor of painting”, completing huge murals depicting the lives of the Greek heroes. He used four colours in his palette: white, red, ochre, and black, and in various combinations. His most famous subject was a series of paintings of the Trojan War placed in the Propylaea on the Acropolis. His ethnic depictions were especially celebrated and spectators could read the thoughts of the characters from their expressions.

During the later 5th century ^{BC} Apollodorus of Athens developed the use of shadows and perspective. Pliny stated that Zeuxis “entered the gates of art which Apollodorus had opened”. Pliny’s description of the painted grapes of Zeuxis reveals a new peak in illusionistic art: birds flew at the panel to peck at the fruit, though his rival, Parrhasius, painted a curtain so convincingly that even Zeuxis was fooled. Parrhasius of Ephesus lived in an ostentatious manner, wearing a purple cloak and golden wreath around his head and singing as he worked.

An important representative of the school of Sicyon was Pausias, who is associated with improvements in colour. In an allegory of *Drunkenness*, a glass bowl was rendered so realistically that a woman’s face was reflected in it. Many of his panels were taken to Rome by admirers to decorate the imperial capital and villas of aristocrats. In the Athenian school Nicias was highly esteemed and fits our contemporary picture of the passionate artist. He was so involved in his painting that he would forget to eat. Nicias was very particular about his subject matter as well, saying that what one painted was as important as how one painted. As with Pausias, many of his paintings were brought to Rome; one was placed in the Roman Senate, another in the temple of Concord.

Apelles, the favourite painter of Alexander the Great, is the artist who surpassed his contemporaries and predecessors in skill, fame, and fortune. He left his native Ephesus for Sicyon to complete his training and was taken by Philip of Macedon to his capital Pella when his talent was recognized. Upon Alexander’s accession, Apelles became the court painter. He used a thin black glaze to unify his compositions and enhance the brilliance of the paints. Apelles was by all accounts a

pleasant man and supportive of his friends. He apparently purchased several paintings by Protogenes at a high price to show his appreciation of his friend's work. Protogenes of Rhodes lived in poverty most of his life but remained dedicated to art, probably saved from starvation by the generosity of Apelles.

Several female painters also achieved a high level of success. Helena, daughter of an Egyptian, is credited with the *Battle of Issus* depicting Alexander's defeat of Darius from which the famous mosaic copy in Pompeii was made. Pliny names quite a few others: Timarete, who painted an Artemis at Ephesus; Eirene, painter of a maiden of Eleusis; Calypso, who painted portraits; Aristarte, who painted Asclepius. Iaia of Cyzicus mostly did commissioned portraits of women as well as a self-portrait with the use of a mirror. She was noted for the rapidity and excellence of her work. Her paintings sold for much higher prices than those of her contemporaries. Another painter, Olympias, is known only for her pupil, Aristobulus. In some cases, the women were daughters and pupils of other painters whom Pliny names. Iaia remained single all her life, devoted to her craft.

There are numerous Graeco-Roman murals in Pompeii, Herculaneum, and other small towns nearby which were perfectly preserved by the eruption of Vesuvius in AD 79. Unfortunately, the paintings are unsigned; some are possibly copies from famous compositions done by Greek painters. The murals themselves have been categorized into four basic styles ranging from simple reproductions of marble surfaces to elaborately conceived and depicted landscapes, architectural compositions, portraits, and panel paintings set within ethereal frames.

Palestine

The name Palestine is derived from the Peleset (the biblical Philistines), a people settled on the coast of Palestine in the 12th century BC by the Egyptians to look after their interests; attempts to link them with the Mycenaean Greeks are highly speculative, though there are cultural similarities. There were contacts with Greece from the earliest period, but they were not especially significant, though the southern range of the cities of the Phoenicians, who had a decisive influence on the development of Greek culture from the 10th to the 7th centuries BC, overlaps into Palestine.

Palestine really enters Greek history with the conquest of the Persian empire by Alexander the Great of Macedon, who took it over on his way to Egypt in 332 BC. With the division of Alexander's empire on his death, Palestine was initially controlled by the Ptolemies of Egypt, and the attractions of Greek culture made themselves felt almost at once. In particular, Ptolemy recruited a large number of Palestinian Jews to populate the new city of Alexandria. This new Jewish community became exclusively Greek-speaking (and was responsible for the translation of the books of the Old Testament into Greek – the Septuagint – with momentous consequences both for Christianity and for the development of the Greek language), and its continuing contact with the Jews of Palestine was one of the means by which the international Hellenistic culture made its influence felt in Palestine. Thereafter, though the local Semitic language, Aramaic, continued to be the first language of most people in the region, knowledge of Greek spread very widely, and it seems likely that many people would have had at least some knowledge of the language. By 198 BC the Ptolemies had been driven out by the Seleucids, and subsequently one section of the population of Palestine, the Jews, reacted strongly against the spread of Hellenization (the issues are obscure, but seem to be related to the introduction of Greek institutions, such as athletics, into Jerusalem); the outcome was a rebellion which, thanks to the Seleucids' problems with the Parthians and the Romans, ultimately led to the setting up of a Jewish state under the Hasmonean dynasty. Though the ideology of the new state was "anti-Greek", the attractive influence of Hellenism continued to exert itself. The kings, for example, took Greek names (Aristoboulos, Alexander), and while the non-Jewish cities of Palestine were trying to establish ancient links with Greek culture (Joppa, for example, claimed to be the place where Perseus saved Andromeda from the sea monster, and other non-Greek cities invented Greek founders), the Jews went one better and claimed that Sparta was a Jewish colony (1 Maccabees 12: 5–23). Later, when Herod became king under the protection of the Romans, the Temple he built in Jerusalem was

essentially in a Hellenistic style. Herod, indeed, founded a new city on the coast, Caesarea, which was entirely Hellenistic in nature, and equipped with the standard institutions of the Greek lifestyle, including theatres, statues, and temples.

The reduction of Palestine to a Roman province, and the crushing of two Jewish revolts in the 1st and 2nd centuries AD, removed the Jews from effective control of the region, and thereafter the process of Hellenization followed the same pattern as elsewhere in the Roman empire. The growth of Christianity, however, gave Palestine a new significance in the Greek world. Herod's foundation, Caesarea, was a particularly influential centre for the development of Christian thought. The Alexandrian theologian Origen worked there in the 3rd century toward the end of his life, and founded a school that played a decisive role in the formation of the eastern tradition of theology. In the next century the Christian historian Eusebius was bishop there. Later, with the establishment of Christianity as the official religion of the empire, Palestine became the home of a monastic tradition that was one of the roots of Orthodox monasticism. The patronage of the emperors from Constantine onwards resulted in the construction of major shrines in places important in Christian tradition, especially the Church of the Holy Sepulchre in Jerusalem. As a result, a long tradition of "religious tourism" had by the 4th century developed into pilgrimages proper, travel to sacred sites in the hope of accumulating spiritual benefits. The special position of Jerusalem is shown by the decision of the Council of Nicaea (325) to raise its bishop to the status of patriarch, fifth in precedence after the bishops of the politically more significant sees of Rome, Constantinople, Alexandria, and Antioch. Though politically a backwater, Palestine continued to be spiritually significant throughout the Byzantine period, and after the Arab conquests Byzantine emperors regarded the protection of religious communities there as one of their special responsibilities.

Pamphylia

Region of southern Asia Minor

Pamphylia consists of a broad plain along the southern coast of Asia Minor, between the more difficult mountainous territories of Lycia to the west and Rough Cilicia (Cilicia Tracheia) to the east. It is framed by mountains to the north, through which passes give access to central Anatolia. The mountains are snow-covered in winter, and give rise to rivers, the most important of which is the Eurymedon, ensuring that the plain is well watered and fertile. It is a lush region (modern crops include cotton and bananas), and is obviously a desirable area in which to live.

In antiquity its population seems to have been of mixed origin, indeed, its name “all tribes” suggests. It would have been known in the Bronze Age to traders sailing from the Aegean to the Levant and Cyprus, and there is a tradition of Greek settlement in the area, though whether this goes back to that period, or, more likely, reflects something of the movement of peoples in the disturbed times at the collapse of the Bronze Age states is unclear. The legendary founders of this settlement include Mopsus, a seer who was the son of Manto, daughter of Teiresias. He drove the Carians from Clarus in Ionia, where he inaugurated the famous oracle. His name has been identified on Hittite documents, and on a Luwian Phoenician inscription at Karatepe, and may therefore be Anatolian in origin, assimilated into a Greek tradition of settlement. This all brings out the mixed origins of the peoples of Pamphylia, but by the Classical period Greek certainly was established as a language of the region, in a dialect which was related to Arcado-Cypriot, implying that the Greeks did arrive at the same time as they did in Cyprus, when the dialect indicates a unity between this region and the Greek homeland. An exception seems to have been the city of Side. Arrian, writing in the 2nd century AD, says this place was founded by settlers from Cyme, but once they had arrived they promptly forgot their native Greek and began to talk in a foreign tongue, which was not the usual (and, by implication, non-Greek) language of Pamphylia, but a “new” dialect of their own. Such stories reflect the mixed origins of the Pamphylians of the Classical period. There is virtually no archaeological evidence to illuminate this very early period.

By the end of the 6th century Pamphylia was part of the Persian empire. The Ionian revolt, in conjunction with the rising in Cyprus, probably sought to exclude Persian influence in this strategically important area, but failed. This policy was revived by the Athenians under Cimon, culminating in the presence of an Athenian fleet in the waters off Pamphylia and the battle of the Eurymedon, when the Persian fleet was driven up the river and annihilated. This may have led to the inclusion of the Pamphylian cities in the Delian League. The

evidence for this is slight; the Athenian tribute list of 425 BC, when the tribute paid by Athens' allies was sharply increased to pay the costs of the Peloponnesian War, includes Celenderis in Cilicia and in Pamphylia Perge and Sillyon, as well as another Pamphylian city the name of which is now missing from the inscription but which is generally identified as Aspendos. Pamphylia was hardly within Athens' area of interest or control at this date, but a reasonable explanation is that the list includes, rather optimistically, all places which were once part of the alliance, and for this the period following Eurymedon is the most likely. What is clear is that when Athens and the Persian king, whether tacitly or by treaty agreement, recognized each other's sphere of influence, Pamphylia was in Persian hands; the inability of the Athenians to retain control is a reflection of the setbacks they experienced after Eurymedon, and the geographical difficulty of defending the Pamphylian communities.

Pamphylia remained under Persian control until the arrival of Alexander the Great. He first occupied Perge, where he was received by envoys from Aspendos, who surrendered their city to him, asking in return to be left free from the imposition of a garrison. Alexander agreed, but demanded in return 50 talents to pay his troops, and all the horses bred there as tribute to Darius the Persian king, implying that he did not recognize it as a Greek city to be liberated from Persian control. He also occupied Side, but had to besiege Sillyon, at which Aspendos reneged on its agreement; it was then forced to accept a governor and to give hostages. In the Hellenistic period Pamphylia first came under the control of the Ptolemies of Egypt. In the wave of Greek settlement in Egypt instigated by Ptolemy II many of the Greeks came from Pamphylia, the most distinguished of them being Apollonius of Perge, one of the greatest of Hellenistic mathematicians.

Pamphylia, however, remained vulnerable, Ptolemaic control being disputed by the Seleucid kings and by the neighbouring Pisidians. In the 2nd century BC it was taken over by the Pergamene kings, who founded the fifth of the great Pamphylian cities – Attaleia, the modern Antalya. Through this it was incorporated with the kingdom of Pergamum into the Roman province of Asia, eventually becoming part of a joint province with its western neighbour Lycia. Attaleia had by then lost territory through its support of the pirates in the troubled times of the 1st century BC, and was forced to accept under Augustus a settlement of legionary veterans of Italian origin.

It was the period of Roman peace which brought the greatest prosperity to the Pamphylian cities, though its inland mountainous areas seem to have remained more backward. Before this the cities were probably restricted places. Arrian describes Aspendos when it

rebelled against Alexander as built on a very steep hill, the base of which was washed by the river Eurymedon. Similarly Perge includes a steep-sided hill, which may be the original settlement; small-scale excavations (not yet published) which are being carried out here may throw light on its earlier development. In the Hellenistic period Perge was extended to include a large area of flatter ground below this hill, and this was surrounded by strong fortifications, with regular tall towers to accommodate the latest forms of torsion artillery, and an imposing main gate at its southern end. Even so the place was further extended in the Roman period, with a great theatre and adjacent stadium constructed outside the earlier limits.

Perge, above all, demonstrates the strength of the Hellenic city tradition in the Roman period, when it was the metropolis of Pamphylia. During the 2nd century AD, when the region was untroubled by any major historical occurrences, the architecture of Perge was greatly enhanced, not as a part of some remote imperial gesture of support but through the wealth of its local aristocracy. The main street, running from the acropolis to the southern gate, exemplifies this; broad, paved, lined with colonnades, and with an artificial stream down its centre fed by a splendid fountain at its northern end and running in a sequence of low waterfalls as it descends towards the city gate. The theatres of Pamphylia are equally spectacular. Perge has an auditorium built against a hillside, as does Aspendos. Aspendos is structurally complete, though the decoration of its stage building has gone. At Perge the stage building has collapsed (it is now, slowly, under reconstruction) but the elements of its elaborate facade survive. At Side the theatre stands on flat ground, its auditorium supported on a vaulted substructure, though this is built entirely in the local cut-stone tradition, not employing the Roman concrete technique.

Pamphylia escaped the worst consequences of Roman decline in the period of the late empire. It was the creation of an Arab fleet in the mid-7th century AD that exposed its weakness. Prosperity seems to have suffered as a result of the rise of Islam and the loss of whole sections of the Byzantine empire, and the population of the cities declined as a consequence. The great city walls enclosed areas too vast to be defended, and unnecessary for the population. The circuit of Side was reduced, the theatre being incorporated into an inner line of defence. But the decline continued, and further Arab threats in the 10th century resulted in a similar reduced fortification at Attaleia, much of which has been destroyed only recently. At the present time, only Antalya survives as a flourishing, rapidly expanding, but essentially non-Hellenic city.

Summary

A region of southern Asia Minor, Pamphylia ("all tribes") had a cosmopolitan population in antiquity. By the Classical period the Greek language was established but the region remained under Persian control until the arrival of Alexander the Great. The prosperity of the area is indicated by the size of the Hellenic cities of Perge, Sillyon, Side, Aspendos, and Attaleia.

Paphos

City in Cyprus

The kingdom of Paphos was already established in the 12th century BC, together with the other kingdoms of Cyprus which flourished mainly in the 1st millennium BC. The site of ancient Paphos (often referred to as Palaipaphos) lies about 15 km southeast of the modern town of Paphos, at a distance of about 1 km from the sea, under the houses of the modern village of Kouklia. In the 1950s the French archaeologist Jean Bérard tried to prove through excavation that ancient Paphos was situated near the northern outskirts of the modern town, but the results were negative.

The site of Old Paphos has been known since the 19th century, mainly because of the remains of the temple of Aphrodite which survived above ground. It was then that the first excavations were carried out, and the first inscriptions from the site of the temple were brought to light which mention the Great Goddess of Cyprus. According to legend the founder of Paphos was Kinyras, representing the indigenous population, but at the end of the Trojan War (soon after 1200 BC) the king of the Arcadians, Agapenor, came to the island with other Arcadians and founded a city of which he became the king. Behind these myths may lie the historical events which are attested by archaeological evidence, namely the beginning of the Achaean colonization of Paphos. Paphos must have been an important urban

centre during the 12th century BC. This is reflected by the magnificence of the architectural remains of the temple of Aphrodite and the wealth of the tombs excavated in the Evreti locality which yielded gold jewellery, carved ivory mirror handles, seals, and other artifacts. The Achaeans mingled with the local population and by the 11th century BC, when the process of colonization was completed, there is evidence for the use of the Greek language in the area. On a bronze skewer, found in a tomb of the 11th century BC, there is an engraved inscription with the Greek name Opheltes in the genitive in a form which is peculiar to the Arcadian dialect. Extensive excavations in the early Geometric cemeteries of Old Paphos have brought to light ample evidence for the influence which the Achaeans exercised on the material culture of Paphos (pottery, bronzes, and other objects) as well as on tomb architecture. It should be mentioned here that it is in the tombs of Paphos that there is material evidence for early contact with the Levantine coast, clearly the result of trade which may have been the source of wealth for the Paphians.

Recent archaeological excavations at the site of the temple of Aphrodite have proved beyond any doubt that the original temple was established early in the 12th century BC. It may have been dedicated to a local goddess of fertility, whose worship had a long tradition in the area of Paphos (since the Chalcolithic period). By the time of the Homeric epics, however, the temple is known as the temple of Aphrodite. It was to Paphos, according to Homer, that Aphrodite fled after she had been caught red-handed by her husband Hephaestus in her love affair with Ares. There she had a temple with a fragrant altar (*Odyssey*, 8. 360–66). The temple must have contributed considerably not only to the fame of Paphos as a religious centre throughout the Hellenic world and also the Levantine region, but also to the economic growth of the town. The goddess of Cyprus, Aphrodite, is referred to in Greek literature as Kypriis or Paphia. Paphos is comparable to Delphi; the Greek lexicographer Hesychius (1st century AD) refers to Paphos and Delphi as the “omphalos of the earth”.

The actual remains of the 12th-century BC temple are too scanty to allow an accurate reconstruction. Based on representations of the temple on seals and coins dating from the Hellenistic and Roman periods, it may be suggested that the original temple consisted of a large courtyard with a perimeter wall constructed of large well-hewn blocks of stone, some of which still survive in situ. There must have been a tripartite structure (as shown in later representations), a holy-of-holies, in the central part of which the sacred aniconic symbol of the goddess, a conical meteoric stone which actually survived, was kept.

The history of Paphos during the early decades of the 1st

millennium BC is known mainly from archaeological discoveries in its rich cemeteries. In particular, a tomb of the 8th–7th centuries BC yielded not only rich tomb gifts, but also evidence of special funerary customs, namely the sacrifice of horses with their bronze gear; there were also iron firedogs and skewers, a bronze shield, pottery imported from the Aegean, bronze vessels, and other grave goods. This was not the tomb of an ordinary man. Both the architecture of the tomb and the wealth of the gifts which it contained justify comparison with the “royal” tombs of Salamis, where members of the royal family or prominent citizens, members of the aristocratic elite, were buried. Numerous terracotta votive figurines have been found in the area of the temple of Aphrodite which betray the two cultural traditions to be found in Paphos, and also throughout the island, during the Archaic period, when the island was under the Assyrians: the Greek tradition illustrated by figurines of the goddess with uplifted arms, a type which was introduced from the Aegean in the 11th century BC, and figurines of a Phoenician type.

Assyrian rule over Paphos and the rest of Cyprus is reflected by the so-called prism of the Assyrian king Esarhaddon, which commemorated the reconstruction of the royal palace at Nineveh in 673/72 BC. Ten tribute-paying kings of Cyprus are mentioned, one of whom is “Ituandar, king of Pappa”. His name is Greek, Eteandros, which is known also from other inscriptions. Other kings of Paphos with Greek names are also known from inscriptions of the 6th century BC, namely Stasis and his son Onasicharis.

Paphos suffered the same political fate as the other cities of Cyprus. After the Assyrians, the Egyptians ruled Cyprus for a while (669–545 BC). In 545 the kings of Cyprus submitted voluntarily to Cyrus, king of Persia, whose rule was ruthless. Paphos took part in the Ionian revolt against the Persians, together with the other cities of Cyprus, in 499. The Persian army besieged Paphos and a fierce battle was fought outside the northeast gate of the city. Archaeological excavation revealed some dramatic moments of this siege. The Persians built a mound outside the gate to reach the height of the city walls, but the besieged undermined it with countersiege works. To build the siege mound the Persians used stones and sculptures pillaged from a nearby Archaic sanctuary. The sculptures include fine heads of limestone, some of them illustrating Egyptianizing stylistic trends, but other sculptures such as a marble winged sphinx betray the influence of Greek art. Mention should be made of the discovery of a Greek bronze helmet, no doubt belonging to a Greek soldier who defended the city against the Persians. Paphos, together with the other cities of Cyprus, fell under the Persian yoke once more.

The names of several kings of Paphos of the Classical period are

known from their coinage. One of the best known is King Nikokles. He seems to have objected to the lust of the cult of Aphrodite, and introduced to Paphos the cult of Hera, the goddess of family life. Finally, in about 320 BC, he transferred his throne from Palaepaphos to Nea Paphos, about 15 km to the northwest, near the coast, where he built a temple to Artemis Agrotera, demonstrating again his feelings against the cult of Aphrodite. Nikokles was responsible for the building of a harbour and the defences of the new city, remnants of which have been uncovered in recent years, in the western part of the city, with monumental gates and ramparts. The vertical rock face provided adequate protection against possible attacks from the seaward side.

Nea Paphos flourished under the Ptolemies. In the 1st century BC they transferred the seat of government from Salamis to Nea Paphos, which was more easily accessible from Alexandria. The mint of Paphos was quite important during the Ptolemaic period, as is illustrated by a hoard of 2484 silver tetradrachms found during recent excavations. Several Greek gods were worshipped at Nea Paphos including Zeus Polieus, Leto, Apollo Hylates, Artemis, Aphrodite, and Hera. The city had a gymnasium and a theatre. A playwright of the 3rd century BC who was a native of Paphos is known by name, Sopatros. Among the political-religious institutions of Paphos, the “Koinon Kyprion” (the confederation of the Cypriots) aimed at the promotion of the ruler cult. The city must have had monumental buildings, but none of these has survived. The splendour of the rock-cut “tombs of the kings”, imitating those of Alexandria, echoes the importance of the Ptolemaic city.

Palaepaphos, with its temple of Aphrodite, continued as a religious centre during the Hellenistic and Roman periods, but its economy declined considerably, having lost the status of capital of the region.

The Romans favoured Paphos to a considerable extent and they retained it as their capital and as the headquarters of the Roman garrison. Culturally, however, as in the rest of Cyprus, the Hellenistic civilizations lingered on. The spacious and luxurious villas with their polychrome mosaics, which have been uncovered during recent excavations, illustrate the importance of Roman Paphos. In the Acts of the Apostles it is mentioned that St Paul and St Barnabas preached Christianity in Paphos, and Sergius Paulus, the governor of Paphos, was converted to Christianity in AD 45.

The repeated earthquakes of the 4th century AD destroyed the splendid buildings of the city, although some of them were repaired and continued to be used down to the 5th century. Christianity prevailed completely by the 4th century, in spite of some efforts to revive the old pagan religion. Paphos regained part of its old

Papyrus and Parchment

Stone, metal, clay, pottery, wood, wax, and other materials were all used as writing materials from an early date, but it was the lightness and convenience of papyrus, parchment, and paper that made writing a portable and accessible activity.

Evidence for the use of papyrus (from which we get our modern word paper) dates from the 3rd millennium BC in Egypt, and it was used in Greece from at least the end of the 6th century BC, as proved by its depictions on pots. An early Greek word for papyrus, *byblos*, may indicate that it came to Greece from Phoenician Byblos at the same time that the Greeks obtained their alphabet in the 8th century.

The papyrus plant, although cultivated in Palestine and Sicily in antiquity, was native to Egypt, where it was produced commercially for purposes as varied as material for boats, for sandals, and, of course, for writing. The primary production area was the lower Nile and delta, probably giving rise to Alexandria as its principal distribution centre later. Pliny (*Naturalis Historia*, 13. 74–78) provides the most extensive, if sometimes faulty, description for the manufacture of papyrus sheets in antiquity. The triangular-sectioned stalk was sliced into strips c.30–40 cm long, the centre pith providing the most prized grade of material, the outer strips the least prized. Strips of similar quality were set parallel to each other on a flat surface; a second layer was then placed at right angles on top and the

two layers were pressed to release the natural gluten in the papyrus, which served as the bonding agent for the dried sheet. After drying, the sheets were smoothed with a smooth stone or shell before being attached to other sheets with a wheat paste and vinegar (probably to kill mould) by overlapping sheets by 1–2 cm. For writing from the left, the left sheet overlapped; for writing from the right, the right sheet overlapped. Individual sheets might be used for accounts and records, but literary works often used about 20 sheets in a book roll c.6–8 m long by 0.11–0.24 m wide. Customized rolls of different dimensions have produced examples more than 40 m long but customers generally bought a “regular” book roll and then cut or added according to need. One of these rolls would accommodate a dramatic text of c.1500 lines, two books of Homer, or one book of a prose writer such as Thucydides.

Most often the inside of the roll had the horizontal strips of papyrus. This helped to reduce the strain caused by rolling and unrolling but, more importantly, the horizontal grain aided writing and became the primary writing surface. The outside, composed of the vertical strips of papyrus, was not regularly employed as a writing surface although many exceptions exist. In addition, since the inks applied by reed pens were water soluble, the writing on the surfaces of both papyrus and parchment was often sponged or rubbed off and then reused (as a palimpsest). In order to protect the papyrus when rolled up, the first sheet, called the protocol (*protocollon*), was often attached at right angles to the grain of the next one. Occasionally parchment was used to reinforce the vulnerable sheet and the roll was wound around a cylinder to help protect it. Cedar oil was used to repel worms.

A variety of animal skins also served as writing materials. Two processes were used to procure a suitable surface although the initial stage was the same: the skin of the freshly slaughtered animal was temporarily cured to inhibit decay, allowing later processing, or the skin was immersed in a solution to help loosen flesh and hair, which were then removed. At this point the processes diverged. Hides steeped in tannins produced durable and flexible leathers. In the second process, hides were first slaked in lime and then rubbed with calcium oxide. Next they were stretched on a frame and gently air-dried in an environment that maintained a moderate temperature. At that point the hides were removed from the frames and smoothed with pumice or chalk to increase their whiteness. The final product, which might also be thinned by shaving, was parchment (goat or sheep) or vellum (kid or calf). The stiff and durable material was then cut into sheets and sewn into rolls with hair-sides on one surface and flesh-sides on the other. Later, in the 1st century AD, both parchment and papyrus were bound into codices (see below).

Papyrus was the favoured material throughout antiquity, even though hides were used as writing surfaces in Asia Minor from the beginning of the 1st millennium BC and in Greece probably from the 6th century at least. The theory that papyrus was eventually surpassed by parchment and paper since they have a better surface and are lighter in colour is not true. Pliny's (*Naturalis Historia*, 13. 21) statement that parchment was invented at Pergamum (*pergamena* is its name in Latin and Greek) also seems unlikely, but its surge in popularity probably arose in the first half of the 2nd century BC when problems with papyrus supply from Egypt gave the Pergamene rulers the opportunity to increase its prominence and distribution. During the Middle Ages parchment, even though more expensive, became the prized writing material largely as a result of its durability and wide availability, which was not governed by geographical restrictions and climate. Its use for liturgical purposes and then for legal and medical documents contributed to its success. Not until the 12th century did parchment begin to lose its position as the pre-eminent writing material, when the Moors introduced into Spain rag paper, an invention of ancient China that had steadily gained in popularity from the beginning of the 2nd century AD.

Book rolls were the most common medium for both papyrus and parchment throughout most of Greek and Roman antiquity. Wood tablets and hollowed wood tablets containing wax inserts, upon which accounts and temporary texts and exercises could be scratched or chalked, were joined together by a clasp or leather thong through holes and used as a type of notebook as early as the beginning of the 1st millennium BC in the Middle East and certainly by the early 5th century BC in Greece. The book roll, however, remained the preferred medium for longer, permanent texts. By the 1st century AD papyrus sheets and folded sheets of parchment began to replace the ungainly wood tablets. This produced a less cumbersome notebook that eventually, in its most common form, consisted of quires (gatherings) of four wide sheets of parchment folded along the vertical axis and sewn along the fold. The resulting codex (book) had eight leaves (folios) making sixteen pages, which were bound within a sturdy covering.

The new medium, however, did not win immediate acceptance among a seemingly conservative writing community. Doctors and astrologers may have promoted the use of such notebooks, but the acceptance and eventual domination of the codex over the ubiquitous book roll has been plausibly attributed to the newly emerging Christian religion. The codex provided a format that was clearly superior for recording and recovering information, and was convenient to carry, especially in contrast to the incredibly

cumbersome book roll. For the first time it was possible to examine texts quickly and efficiently. The distinct format of the codex may also have been attractive to the new religion, which sought to set itself apart from the book roll of Jewish and pagan tradition.

From the 2nd century AD Christianity regularly employed the codex to record the Old Testament, New Testament, and Apocrypha. This use in conjunction with the growth of Christianity itself led directly to the acceptance of the codex as the standard format for the written world. Early Christian codices are all very utilitarian, but by the 4th century elegant volumes were being produced that contained elements foreshadowing medieval book illustration.

After the advent of writing, the innovation of the codex represents perhaps the most important advance to promote learning. Now real research could be recorded easily and efficiently.

Parmenides c.515–c.440_{BC}

Philosopher

Parmenides was a Presocratic philosopher who lived in the southern Italian town of Elea (near the modern town of Agropoli). He was the first of a group of philosophers who are called Eleatics, the others being Zeno and Melissus. Parmenides also appears as a character in Plato's work *Parmenides* and is the probable inspiration for the character of the Eleatic Stranger in the same author's *Sophist* and *Politicus*, written a century after his death.

In the ancient world Parmenides and his successors were celebrated as opponents of the possibility of change. Just as Heraclitus was supposed to maintain, as a basic proposition, that everything is in constant change, so Parmenides and the Eleatics were held to be committed to the denial of the possibility of any change. But as with Heraclitus, this characterization somewhat distorts the emphasis and focus of their concerns. It is more accurate to construe these philosophers as early metaphysicians. Their concern lay with the nature of what there is and what is real. Change comes into the discussion through this motivating interest.

Parmenides' words are preserved for us through extensive quotations in Simplicius, writing some 1000 years later in the 6th century AD. His work is a poem which, after a hieratic introduction invoking divine assistance, contains two notably contrasting parts. In the first part he expounds the truth, while in the second he relays the erroneous opinions of unenlightened speculators. In the Way of Truth (as it is often called) he argues that if something can be spoken and thought about, it must exist; nothing is not a possible subject for investigation. "You cannot say or think what is not there", is his controlling refrain. Any possible subject for investigation, is.

As the argument advances, he establishes further facts about this existent subject: it is without beginning or end, single, whole, and invariant. Parmenides establishes each of these conclusions on the same basis as his original argument: the position that he will endorse

commends itself because it enables him to avoid thinking or talking about nothing. As the author of this ongoing argument, he insistently reminds us of the conditions for any rational communication. He concludes this part of his argument by comparing his subject to “a well-rounded sphere, everywhere equally balanced from the centre”.

Parmenides then passes to an account of a less enlightened way of thinking, which he declares to be thoroughly false but still wishes to expound. This account differs from the Truth in being comprehensively dualistic. Opposing pairs – such as Night and Day – are admitted into the scheme of things, rather than the introduction of the one requiring the exclusion of the other. Yet even here the method of argument is resolutely hard-headed and rationalistic, bearing the stamp of the author of the Truth.

Was Parmenides’ Way of Truth meant to be an account of the physical universe or of some quite different order of reality, or of some monadic element in either of these schemes? Some would regard the question as quite anachronistic, and certainly any detailed answer to it is underdetermined by his own words. His argument points in the direction of every one of these philosophical developments, while not favouring or excluding any of them. The comparison of reality to a sphere may indicate spatial extension but it need not.

Parmenides’ originality and achievement consist in four points. First, he introduced questions concerning existence into the explicit agenda of philosophy; he is the father of ontology. Secondly, he grounded this ontological discussion in the conditions for successful talk and thought. This is a feature of method that he shares with Heraclitus; both philosophers thus deserve the credit for first raising issues in epistemology. But in Parmenides the control exercised by considerations of language is paramount. He is the first philosopher of language. Thirdly, he expounded profound paradoxes about the possibility of change; thereafter no philosopher could assume that change was an unproblematic phenomenon. Finally he was the first philosopher to use argument. He advances from one statement to another with the armoury of “therefore” and “since”. According to some current conceptions of philosophy, this last feature of his work would suffice to establish him as the first philosopher.

Parmenides and his immediate Eleatic successors bequeathed a powerful agenda of problems to subsequent Greek philosophers. The sophists of the following generation of 5th-century BC philosophers included Gorgias, who wrote a nihilistic essay in the Eleatic style *On What There Is Not*. These thinkers also developed epistemological paradoxes of change – for example, that learning and enquiry are impossible because there is no intelligible way for someone to advance from a condition of ignorance to one of knowledge. This is a version

of the paradox of enquiry, first adumbrated in Plato's *Meno*. In later works, notably *Sophist*, Plato confronts the central Parmenidean claim that *what is not* is unintelligible and undiscussable. His highly original analysis of this issue turns on securing a sense for "not" according to which it means "other than".

Aristotle's philosophy is greatly influenced by Parmenides, even though the influence appears to be negative. In his own ontology, the ability to bring about and undergo change is a deeply important fact about most things that exist; and his programme of philosophical enquiry is organized accordingly. Therefore he regards Parmenides, with his utter rejection of the significance of change for natural substances, as a wrong-headed maverick. But he is compelled to give an account of change that removes from it any air of paradox. Aristotle achieves this with analyses that involve his novel concepts of potentiality and actuality and of matter and form. The motivation for these influential doctrines is a desire to show that change, so far from being mysterious as Parmenides had argued, is intimately bound up with the nature of everyday substances.

Aristotle's anti-Eleatic polemic was in part directed against certain contemporary philosophers, sometimes known as "Megarians". These included Eubulides, Philo, and Diodorus Cronus, who were interested in modal logic. Their interest in rigorous argument, and their paradoxical theories about possibility and necessity, bear the stamp of Parmenides.

From this point on Parmenides' direct influence wanes; but his philosophical personality looms large as philosophers from Kant onwards have pondered the idea that there are – or may be – limits to what can enter the scope of rational enquiry and discussion. Are there truths that transcend human powers of ratiocination? Parmenides in effect replied "no" to this question; and even those philosophers who are inclined to reply otherwise, must acknowledge the posing of this fundamental philosophical question as Parmenides' greatest legacy.

J.D.G. EVANS

Biography

Born in Elea in southern Italy c.515 BC, Parmenides was the first of a group of philosophers known as the Eleatics. He was the first philosopher of language. He is said to have visited Athens when aged 65. He appears as a character in Plato's *Parmenides*. He wrote a philosophical poem which survives only through quotations in Simplicius (6th century AD). He died c.440 BC.

Parthians

The Parthians were originally the people who lived in the Achaemenid province of Parthia (Parthava in Old Persian), which comprised the region of Chorasan in northeastern Iran and of southern Turkmenistan. The Parthians later came to be identified as the people of the Parthian empire, founded by the Parni, a nomadic people, who entered Parthia from the northeast in the mid-3rd century BC and adopted the name "Parthians" for themselves. Through gradual expansion the Parni/Parthians built an empire, which lasted for almost 500 years, from 246 or 238 BC to AD 224, and which stretched from the Euphrates to the Indus. Until the Parthians revolted against the Seleucid empire, Parthia remained a satrapy; during the reign of Antiochus III (223–187 BC) the Parthians were still regarded as vassals. Early Parthian coins bear a Greek legend and show that the Parthian kings did not always use a royal title; by the middle of the 1st century BC Parthian script was used and kings had adopted the Achaemenid royal title of "king of kings".

The expansion of Parthia from kingdom to empire was a gradual process which lasted over 100 years. After the death of Antiochus III in 187 BC, Parthian troops under Phraates I (176–171 BC) began campaigns against the mountain people north of the Elburz mountains, followed by campaigns south of the Elburz, led by his successors. Territorial conquest on a large scale was undertaken by Mithridates I (171–139/38 BC), who first secured the eastern lands for the empire, Bactrian territory in 160 BC, and eastern Iran in 150/145 BC. During the 140s BC Media was conquered and the Seleucids were driven out of Iran, allowing Mithridates to campaign against Babylonia and Elymais. With Adiabene, Gordyene, and Osroene, in northern Mesopotamia, as client kingdoms, and control of Dura-Europus won in 113 BC, the long period of Parthian conquest and expansion was completed.

The Parthians were ruled by the Arsacid dynasty, named after the founder of the empire, Arsaces I (c.248/238–217 BC). First establishing their power in the cities of Hecatompylos and Nisa, the Parthian kings then centred their power in Ctesiphon and Voloesocerta. The Parthian nobility was headed by the royal councillors (*ordo*

probolorum), followed by the Parthian aristocracy (*pelatai*), the *douloi* (servants), and possibly a slave population. Organized in *regna*, client kingdoms of the Parthian king, which paid tribute and provided military service, the empire comprised a multitude of peoples who spoke different languages and dialects. Parthian became the administrative language of the empire, though other languages, such as Greek, Aramaic, Middle Persian, and Sogdian, were also used. Parthian culture shows distinctive features in art and architecture, most notably the vaulted *iwan* halls and the planning of cities and fortresses.

Parthian influence on the Classical world increased after 20 BC, with the establishment of diplomatic relations between Augustus and the Parthian king Phraates IV (38–3/2 BC). Phraates IV returned the standards taken from Crassus (54/53 BC), Decidius Saxa (40 BC), and Antony (36 BC), while Rome acknowledged the Euphrates as the border between the two empires, and returned Phraates' son to the Armenian throne. The diplomatic treaty marked Roman recognition of the Parthian empire, but Roman propaganda manipulated the event into a public demonstration of Roman superiority over the Parthians, expressed in literature and art. Parthia was considered to be yet another vast, oriental – and therefore inferior – empire, which Rome made little effort to understand.

In literature, the Parthians were stereotyped as cruel, un-civilized barbarians. They were on a par with the Scythians, and with the decadent Persians of the past, being interchangeably referred to as Medes, Persians, or Achaemenids. Roman art after 20 BC shows a preoccupation with the depictions of Parthians as typical barbarians. The statue of Augustus of Prima Porta, dated to 17 BC, prominently displays a Parthian on Augustus's breastplate, "offering" the Roman standards. Parthians were represented as kneeling subjects, as in the case of a huge bronze tripod, or standing as supporting figures in architectural designs. Bronze ornaments representing mounted or dead barbarians in Parthian dress were mass-produced. Statues of Parthian barbarians, first seen at the Basilica Aemilia in the Roman Forum, were sculpted from coloured marble, *marmor Phrygium* or *marmor Numidicum*, symbolizing oriental luxury and colour. Their un-Roman build and stature identified the Parthians as people who were not part of the civilized world of the *orbis Romanus*, but of the *orbis alter*. A Parthian arc was built after 20 BC, depicted on gold and silver coins. Trajan celebrated his shortlived victory over the Parthians with an *aureus*, describing himself as Rex Parthus, and a coin, bearing the legend "Parthia Capta", depicted two barbarians huddled together in front of a *tropaeum*. Blurring the distinction between Persians and Parthians, Roman emperors sought to compare the Greek-Persian

wars of 490 BC and 480/79 BC with Rome's fight against Parthia, in an effort to legitimize Roman ambition to conquer Parthia. The restaging of the battle of Salamis in a vast *naumachia* (ship battle) by the Tiber in 2 BC to celebrate the opening of the temple of Mars Ultor was one of a number of public demonstrations hinting at the Greek–Persian wars, but implying Rome's fight against Parthia. According to Roman ideology, the Parthians were an eastern, barbarian power steeped in oriental luxury, military aggressors who threatened the western world. Roman propaganda was to demonstrate that Rome was dealing with defeated barbarians, not with a political and military power that was equal to Rome. The Romans upheld this view throughout the existence of the Parthian empire and then imposed it on the Parthians' successors, the Sassanians. The Sassanians, for their part, rigorously tried to erase Parthian culture, and it remained largely forgotten until the late 19th and 20th centuries when excavations began in the Near East and the past of the Persian empires was revived. First excavations at Nisa, undertaken by Russian scholars between 1948 and 1961, began to unearth archaeological evidence of the Parthian period, from which emerges, and continues to emerge, a picture of the Parthian empire independent of hostile Greek and Roman sources.

Pastoralism

Pastoralism, that is to say the phenomenon of animal husbandry, has tended to go hand in hand to a greater or lesser degree with an

agrarian economy. Pastoralism can be linked to a farming economy or, at the other end of the scale, be associated with transhumance, the seasonal movement of flocks from one area to another. Pastoralist communities would have a high reliance on domesticated animals for their livelihood.

The first evidence for sheep and goats on Crete as well as mainland Greece comes in the early Neolithic period, that is to say the late 7th millennium BC. Evidence for pastoralism on Crete in the Bronze Age has been presented by excavation of the Early Minoan II site of Myrtos. Some 90 per cent of the animal bones were from ovicaprids, and the excavation suggested that the wool was being processed in individual homes. Indeed it has been suggested that the settlement of Myrtos was possibly seasonal. Also from Crete come some models of sheep from inside a Middle Minoan I bowl found at Palaikastro.

Pastoralism in Arcadia is reflected by the appearance of small bronze dedications during the 6th century BC. These can show shepherds wearing a distinctive conical hat, sometimes wearing a cloak and boots. Often the shepherds carry a sheep or ram under their arms, though one from Mount Lykeios had a small calf on his shoulders. One figure, now in the Metropolitan Museum of Art, New York and said to have been found near Andritsaina, carries an inscription, "Phauleas dedicated [this] to Pan". Many of these Arcadian figures were probably dedicated in the sanctuary of Zeus Lykaeos or the sanctuary of Pan (described by Pausanias, 8. 38. 5). Such types are similar to the now lost dedication made by the Arcadians of Pheneus who commissioned a statue of Hermes by the Archaic sculptors Onatas of Aegina and Calliteles (Pausanias, 5. 27. 8). Pausanias described a statue of the god "in a tunic and a cloak with a peasant's cap on his head and carrying a ram under his arm". Such dedications may suggest specialized pastoral communities. On the island of Rhodes in the Classical period one of the social groups was called a *sunnomos* which suggests that the members had a common right of pasture.

Evidence for pastoralism appears in the faunal material from excavations at Greek sanctuaries. Sheep and goats appear to have been favoured for sacrificial victims at many sanctuaries. Ethnographic evidence shows that culling of flocks can take place in the early summer before there is a lack of suitable pasture for large flocks, or for younger animals in the spring. If pastoralism is geared to the production of milk, then males and ewes which have stopped lactating are likely culling victims.

Pastoralism can also be detected in the epigraphic record. For example, in the 5th and 4th centuries BC the Attic demes of Marathon, Thorikos, and Archia were sacrificing a number of wethers or ewes in

their festivals. Such evidence for flocks makes up for the limited information for Attica available from literary sources. One such example may be the 4th-century BC legal case where sheep – the flock consisted of some 50 animals – were seized from a farm not far from the hippodrome (Demosthenes, 47. 52–53). A male lamb was sacrificed in the early summer on Mount Hymettos in Attica in the cult of Zeus Epakrios, presumably to coincide with the use of the higher winter pasture.

Pastoralism also makes its appearance in literary sources. For example, at the start of the *Theogony*, Hesiod was taught to sing as he tended flocks on Mount Helicon. Clearly the agricultural economy of Askra, so well known from the *Works and Days*, included a pastoral dimension; it should be noted that its pastures are only some 5 km from the lower slopes of Helicon. Aristotle (*Politics*, 1319a.19–23) noted pastoral communities as one of the best forms of democracy (after arable farmers). A more detailed account of sheep can be obtained from the Hellenistic writer Aeschylides (and recorded in Aelian, *On the Characteristics of Animals*, 16. 32), who noted that on the island of Ceos sheep were fed with the by-products of agriculture, such as fig leaves, olive leaves, and husks from pulses, to save on the poor pasture. Such reliance on agricultural products would keep the flocks close to the communities. The converse of this was that the flocks themselves were a ready source of dung which could be used to enhance the productivity of the cultivated plots and fields. However, one reason for the low profile of pastoralism in ancient sources is that shepherding was probably a humble occupation compared to that of arable farming.

The evidence from inscriptions and to a lesser extent literary sources suggests that flocks were usually owned by members of the social elite. For example, one of the mutilators of the herms in 415 BC at Athens had 84 sheep and 67 goats among his confiscated property. The flocks themselves appear to have been cared for by individuals of much lower status, sometimes slaves. Although there are some dedications known from herdsmen, they may have been hired.

One feature of pastoralism is the movement of flocks from summer to winter pasturage, transhumance. This may involve moving flocks from the summer pastures in the mountains to lower areas, sometimes over long distances. There are two main types: the first where the shepherds are drawn from lowland communities, but use the mountains for pasture in the summer; the second, so-called “inverse” transhumance, where the shepherds are themselves mountain dwellers, and only come to lower areas in winter or for markets. In recent centuries transhumance may involve the movement of whole communities, requiring winter and summer settlements. In medieval

Crete the main community was often considered the winter one, often situated at less than 200 m, but by the mid-19th century the reverse was true with communities choosing to make the summer settlement their main centre. An ancient example detected in the literary sources is Sophocles' mention of the Theban and Corinthian shepherds on Mount Cithaeron in the story of Oedipus (*Oedipus Rex*, 1132ff.). However, such transhumance was over short distances; such pastures on Cithaeron lie only some 20 km from Thebes, and 30 km from the Corinthia. This can be contrasted with modern transhumance in the northern Peloponnese which might cover some 100 km. Another ancient example comes from the late 1st century AD on the island of Euboea where Dio Chrysostom (*Orations*, 7. 11–15) mentioned flocks and herds of cattle. Evidence from ancient border disputes suggests that such longdistance transhumance was unlikely.

Border disputes between neighbouring poleis could sometimes hinge on grazing rights. One such dispute in the 2nd century BC, marked by inscriptions giving details of the agreement, was between Epidaurus and Hermion in the southern Argolid. The text of the agreement indicates that pasturage was one of the issues at stake, along with cropping. The agreement records that there had already been a decision “concerning the payment of fees to tax collectors for the pasturage of goats”. The border area in question was clearly delineated in the agreement, and on the ground it corresponds to an area of some 30 sq km with land rising to nearly 800 m. It may have been used for winter grazing, although it has been observed that in recent times the same area is traversed by transhumant shepherds taking flocks between Arcadia (Valtetsiotes) and the southern Argolid. Such recent patterns in Greece are thought to have been dependent on the landholding patterns developed during the Tourkokratia. The southern Argolid was thought to be a particularly attractive area for flocks, as there were ready markets on the offshore islands of Hydra, Spetsae, and Poros.

The number of goats using such land is hard to estimate, if only because other areas of grazing land would probably have been in use, but it has been suggested that something like ten herds each of 200 goats would not be unreasonable. If such numbers were using this area, it was clearly profitable to tax the land's use. A hint at the profits from such activity is revealed by a dedication made in one of the sanctuaries of the polis of Epidaurus by one Timainetos in the mid-4th century BC. Timainetos made an offering to the Dioscuri as “a tithe from the goats”. Although Timainetos may have been one of the tax collectors, he is more likely to have been an owner.

Such disputes in the Argolid over such marginal territory were not unknown. Epidaurus had been in two further separate disputes with

its neighbours, Corinth and Arsinoë (the renamed polis of Methana). It is perhaps significant that at the polis of Troizen in 146 BC there was a group of resident Arcadians. It has been plausibly argued that it was this group of individuals, who had been drawn to, and settled in, the marginal areas of the poleis of the southern Argolid, that was causing the tensions.

Such tensions may reflect the reasons for the 2nd-century BC boundary dispute between Delphi and its neighbour Ambryssos. The boundary between the two cuts across modern transhumance routes, and there is a possibility that grazing rights lay behind the ancient dispute. Such disputes emphasize the general view that mountain regions were considered to be the property of those dwelling in urban communities even though the majority of people chose not to dwell there.

The problem of neighbouring communities seizing flocks may explain the reason for the building of extensive walls for some cities in the Peloponnese. It has been argued, partly on the basis of Polybius' account of a raid on Messene in the 220s BC (4. 3. 8–4. 1), that one of the reasons for its new wall system in the 4th century was to serve as protection for flocks.

There seem to have been restrictions on grazing on land owned by some of the sanctuaries. For example, the inscription from Arkesine on Amorgos relates to some land which was the property of the sanctuary of Zeus and which restricted the pasturing of animals. A 4th-century inscription from Chios restricts pasturing and the spreading of dung on what must be considered sacred land. However, estates belonging to the temple of Delian Apollo on the islands of Delos and Mykonos included grazing land.

Grazing could be the prerogative of citizens who were given specific rights of pasture; such was the case at Tegea in Arcadia. Such rights could then be bestowed on specific individuals for services to the community. In the 1st century AD the citizens of Methana in the Argolid granted grazing rights to a resident of Corinth, L. Licinnius Anteros, in return for his acting on their behalf as *proxenos* (“consul”) in the centre of Roman administration in the province. Such honours may in fact have become meaningless during the Hellenistic period, as sometimes they were bestowed on individuals who dwelt so far from the grazing areas that they are unlikely ever to have been in a position to take up the rights. In Hellenistic Boeotia the cities of Akraiphia, Kopai, and Orchomenus granted grazing rights on water meadows around Lake Copais as repayment for unpaid loans.

Patmos

Island in the Dodecanese

Patmos lies some 56 km off the coast of Asia Minor and 34 km from its much larger neighbour, Samos, to the north. It was never blessed with good agricultural conditions, having poor soil and little water, and has no deep natural harbour; it is quite hilly, with its highest point rising to 270 m. In early Hellenic history it was recorded as being peopled first by Mycenaeans, and later by Dorians and Ionians, but was only mentioned once in passing by Thucydides.

During the Roman period Patmos was used as a place of exile for political prisoners, and it was for this reason that St John (also known as St John the Theologian or St John the Divine, in Greek St John Theologos) was banished to the island, probably in AD 95, during the

Patras

City in the northwest Peloponnese

Patras was one of the 12 cities that made up the Achaean League, an ancient Greek version of the contemporary European Union. The city followed the policy of the league and neither fought against the Persians nor took part in the civil wars between the Greek cities. During the Peloponnesian War, Patras was a passive ally of Sparta without being actively engaged in the conflict.

The Achaean League was dismantled in 338 BC by Philip II of Macedon because it supported Athens against him. In the wars against the Romans, Patras and the re-formed Achaean League supported Philip V. However, after the Romans had defeated him and declared the city independent, it joined the Roman camp. Patras, like all Greek cities, became subject to Rome in 146 BC. After the battle of Actium in 31 BC the city was granted many privileges. It was declared independent and had its own council. It did not pay any taxes and the only liability imposed on it was acceptance of the Roman judicial authority.

The name of the city is believed to be derived from Patreas, a mythological hero who is regarded as its first settler c.1100–1080 BC, although other opinions exist, e.g. that the name is derived from Patrous a district of Egyptian Thebes and was given to the city by a tribe that came from there, or from Patar, a town in Asia Minor. The most probable explanation seems to be the first one. Patreas' father was a nobleman from the region of Laconia in the southeastern Peloponnese who took shelter near Patras after he was found guilty of conspiracy against the authorities. Patreas then conquered the nearby towns and villages and unified them under the name of Patras. Pausanias (2nd century AD) described the city as a cosmopolitan one with many temples, statutes, and groves.

Paul, St

Christian apostle of the 1st century AD

Little more is known of Paul, the second founder of Christianity, than of Jesus Christ, the first. His own letters inform us that he was born an Israelite of the tribe of Benjamin, that he became a rigorous Pharisee, and that he persecuted Christians with zeal (Philippians 3: 4–6). It is widely believed, on the evidence of Acts 21: 39, that he was a Roman citizen from Tarsus in Cilicia. His writings partly corroborate Luke's story, which appears in Acts three times with variations, that he encountered the risen Christ while he was carrying his instructions to Damascus. The remainder of Luke's narrative is, however, not so easily reconciled with Paul's allusions to his own history. Where his biographer states that he always preached the Resurrection in the synagogues before turning to the Gentiles, the letters show compassion for the Jews but never speak of them as an object of his own ministry. Paul boasts of eight beatings and three shipwrecks (2 Corinthians 11: 24–25), yet the one flogging and the one shipwreck recorded in Acts both occurred too late to have figured in his reckoning. Acts knows nothing of the 14 years between Paul's conversion and his appointment as the "Apostle to the Gentiles" (Galatians 2: 1–7); Paul's account of a meeting with the Apostles in Galatians 2 cannot be harmonized with Luke's description of the apostolic council in Acts 15. Luke knows nothing of Paul's escape from Damascus under the governorship of Aretas (2 Corinthians 11: 32); Paul claims none of the miracles that Luke attributes to him. Nevertheless, the two records may be complementary rather than contradictory, and a tentative chronology of the letters may be built on Luke's divisions of Paul's labours into four successive journeys, each beginning from Jerusalem. The first began and terminated in Asia Minor, the second included leading cities of Greece and Macedonia, the third retraced the first two with a protracted stay at Ephesus, and the fourth brought Paul to Rome.

If Paul and Luke are both reliable witnesses, the letter to the Galatians would have been written to the churches of south Galatia between Paul's first and second meetings with the Jerusalem elders, as recounted in Acts 11 and 15. The text is a fierce polemic against the "men from James" (Galatians 2: 12; cf. Acts 14: 19), who in Paul's

view have betrayed the first agreement by demanding the circumcision of gentile Christians. Paul maintained that the law had been superseded by the new covenant in the death of Christ (Galatians 3: 15), the carnal circumcision by an inward crucifixion, and the “faith that works by love” (6: 14; 5: 6). The apostolic council ruled in favour of Paul (on circumcision at least), but in the course of his second journey he found that deaths in Gentile churches had raised fears about the salvation of the body. Writing from Corinth (1 Thessalonians 3: 6; cf. 18: 5), he told the Thessalonians that the imminent return of Christ would rouse the dead from “sleep” and then the living would be taken up to join them “in the air” (1 Thessalonians 4: 13–17). Soon after, while he was passing through the Troad and Macedonia, he developed a richer doctrine in three letters to the Corinthians (1 Corinthians 16: 5; 2 Corinthians 2: 13; Acts 20: 1–6), which now survive as two. Every believer, he argued, is a member of a new body, that of Christ, which is united by love and diversified by gifts of the Holy Spirit. We must therefore keep our own bodies free from sin, and commemorate that of Christ in a common Eucharist, where the rich share with the poor. After death our animal body will be transformed into a spiritual body, which, like the true Temple of Israel, will be a “house not made with hands”. For the present, the hope of future glory must sustain us as we suffer in the flesh.

Paul’s voyage to Rome, occasioned by his own appeal to Caesar after he suffered a Roman flogging, was pre-empted by the letter which he sent to that city while bearing a collection to Jerusalem at the end of his third mission (Romans 15: 25–26; cf. Acts 21: 17). Declaring that Greeks and Jews owed their salvation to one another, he exhorted them to renounce their external pieties, to acknowledge the universal reign of sin in our present bodies, to embrace the resurrection with its promise of inward and outward renewal, and thus to live according to the new law of the Spirit, which is fulfilled in love and purity of heart. His subsequent imprisonment is attested by three letters, though the causes remain obscure. Whether he is enjoining Christ’s humility on the Philippians (Philippians 2: 5–12), or warning the Colossians not to follow manmade heresies (Colossians 2: 3–23), or sending back the runaway Onesimus to Philemon, his thoughts are now consumed by the glorious destiny that awaits the “slave of Christ” (Philippians 1: 1; Philemon 1: 1 Colossians 4: 3). According to tradition Paul was decapitated in the Neronian persecution of AD 64, though not perhaps before he achieved his goal of visiting Spain (Romans 15: 24).

Paul may have been the earliest writer to place the confession of Christ as Son of God at the heart of the gospel. He was also the first to offer any theory of atonement, describing Christ as a sacrifice (1

Corinthians 5: 7), as one who became a curse for us (Galatians 3: 15), and as a mercy-seat (*hilasterion*) for our sins (Romans 3: 24–25). His account of the Last Supper (1 Corinthians 11: 23–25) found its way into the liturgy, and his argument that it is better not to marry (1 Corinthians 7) seemed to justify the celibacy of monks. He was variously interpreted, and both Catholics and Gnostics can be reckoned among his heirs. It was therefore almost inevitable that those who wished to claim him should attach his name to spurious compositions. The letter to the Ephesians would appear to be a summary of Paul's mature doctrine by another hand. In the letter to the Hebrews his thoughts are encased in a carapace of arguments and expressed in texts more suited to its (supposed) recipients. The author of 2 Thessalonians was evidently desirous to acquit Paul of a false belief that the world was soon to end. The three "Pastoral Epistles", addressed to Timothy and Titus, were produced to lend authority to the episcopate which developed after his death. They already betray the legalistic, patriarchal, and anti-Jewish sentiments which mar many later readings of the apostle. Among early commentators, Origen took Paul's distinction between the inner and outer man as the key to an allegorical interpretation of scripture, while the Antiochene school of Theodore, Theodoret, and Chrysostom gave more weight to his personality, his audience, and the circumstances of his writing. All agreed, however, that he was preaching not so much freedom from the law as freedom to obey it in the Spirit; hence the Greek Church has resisted antinomian exegesis, with its concomitant beliefs in total depravity and irresistible predestination. Holding that Paul intended to change his hearers and not merely to formulate doctrine, Greek theology emphasizes the ethical and sacramental elements in his thought.

MARK EDWARDS

Biography

Born (as Saul) at Tarsus in Cilicia, Paul was a Jew and a pharisee who persecuted Christians. Converted to Christianity c.AD 33, he became known as the "Apostle to the Gentiles". He undertook four missionary journeys and wrote epistles to many young churches. He was imprisoned in Rome and executed, probably in AD 64.

Pausanias c.^{AD} 115–180

Travel writer

All our information about Pausanias' life has to be gathered from his work: he was not yet fully adult in ^{AD} 130 (8. 9. 7); the first book of his work must have been written before Herodes Atticus' great building programme in Athens, i.e. before ^{AD} 160; his historical references stop around ^{AD} 180. We know next to nothing about his personal life; his work lacks a prologue (where ancient writers usually introduced themselves) and a dedication; even his name is known only from the early Byzantine geographer Stephanus (who used Pausanias' work as a source around ^{AD} 535). Pausanias originated from Lydia, probably from Magnesia ^{AD} Sipylum, because he describes this region with extraordinary care and knowledge. He was born into a wealthy family of the city's elite; his work shows him to be a highly educated man, and he had the means to dedicate his life to extensive travelling (apart from Greece, he knows the whole of western Asia Minor, large parts of central Anatolia, Syria, Palestine, and Egypt). As he rarely mentions living people, we know nothing about his friends or the circles he associated with.

Pausanias' work, the *Periegesis Hellados* (Guide to Greece) in ten books (about 900 printed pages), is very probably completely

preserved. Because parts of Greece are missing in the description and the work has no epilogue, it was sometimes thought that it remained incomplete or that the last part had been lost; this, however, is unlikely, for numerous cross-references throughout show that it was written following an elaborate plan from the beginning, *Periegesis* as a genre arose in Hellenistic times (3rd and 2nd centuries BC), but before Pausanias these works were mostly monographs on very restricted themes. Pausanias' Greece comprises the Greek mainland on the Balkan peninsula; the ten books deal with: (1) Athens, Attica, Megara; (2) Corinth, Argolis, the island of Aegina; (3) Laconia; (4) Messenia; (5) and (6) Elis (with a detailed description of Olympia); (7) Achaëa; (8) Arcadia; (9) Boeotia; (10) Phocis (above all Delphi), and parts of Locris. On the one hand, Pausanias aims to select the most valuable and remarkable from the abundance of curiosities that he saw, but on the other hand he also wants to be as comprehensive as possible; so he often describes small and remote places. Each book starts with an introduction about the legends and mythology of the region, and Pausanias also gives historical explanations concerning the monuments he describes.

In the 19th and early 20th centuries Pausanias was considered a third-rate author, harshly judged by, for example, the influential scholar Ulrich von Wilamowitz-Moellendorff, and accused of plagiarizing older works and not really having seen the things he described. Only since the beginning of the 20th century has it become clear how conscientiously Pausanias fulfilled the task he had set himself, and how astonishingly reliable he is. For a whole series of ancient places he was the decisive guide for modern excavators: at Mycenae, Heinrich Schliemann was the first to understand Pausanias' passage about the town and to draw the right conclusions – namely, that the graves must lie *behind* the Lion Gate; when the monuments of Troezen were excavated in 1941, their identification was possible only because of Pausanias' precise report. His systematic description of Messene, too, was confirmed by the finds; in the town of Callipolis, which according to Pausanias was totally destroyed by the Celts in 279/278 BC, excavations brought to light the completely burned buildings.

Pausanias was well versed in ancient Greek authors, above all lyric and epic poetry (which he often quotes) and, of course, the historians, of whom Herodotus was his great model. In his historical digressions he can be careless, and it is sometimes unclear whether he is giving his own interpretation or quoting from an older source and, if so, from which. On the other hand he is very reliable when he extracts historical facts directly from a monument: he reports hundreds of inscriptions, many of which have been confirmed by finds and have

often proved very helpful for the transcription and historical setting of them.

Pausanias never explicitly states his personal preferences, but they become clear from his selection. First of all, it is its age that makes a site or cult interesting to him; this taste for the ancient is characteristic of the 2nd century AD and shared by many of his educated contemporaries. A more personal trait is his preferring religious monuments to profane ones. In matters of art, Pausanias again shows the high appraisal of the past characteristic of his epoch: he bestows the first place on Phidias, the second on Alcamenes (4. 10. 8); he appreciates some sculptures of the 6th and all of the 5th century BC, as well as the sculptors Cephisodotus and Praxiteles of the 4th century; but only Damophon of Messene of the later period; he has no regard for Polyclitus and Lysippus; nor does he even mention Hellenistic art or Pergamene “baroque”. Similarly, the buildings that please him are from the 5th and 4th centuries BC.

Historically, Pausanias is interested in the period of independent Greece (mostly the 4th century BC); he judges Greek states according to their behaviour when Greek freedom was endangered; in his eyes, only Athens always did its duty. Though living in the Roman world, Pausanias feels totally Greek, as his work shows throughout. He exhibits no open resentment towards the Romans, but they are foreign rulers, and unlike some other contemporaneous writers (e.g. Aelius Aristides) he does not regard Roman world dominion as logical or natural; he points out the brutalities and pillagings of Roman generals, above all of Sulla. However, as things improved in the 2nd century AD, Pausanias several times praises the philhellene Roman emperors Hadrian, Antoninus Pius, and Marcus Aurelius, who showed respect and care for Greece and its heritage; but he never appreciated Greece’s loss of freedom.

Unlike other “intellectuals” of his time, Pausanias did not catch the public eye and apparently failed to reach the reader-ship for whom he wrote, perhaps (as Habicht suggests) because by the time of his writing the great wave of Roman “philhellenism” was already over. Another reason for this neglect may be the curiously mixed character of his work: for people who just wanted a traveller’s guide the long historical digressions were boring, while those more interested in history did not want to read descriptions of buildings and works of art they did not have before their eyes. Apart from Stephanus of Byzantium (see above), the only attested reader of Pausanias in antiquity may have been Aelian (c.AD 200). In Byzantine times, too, he is apparently ignored by Photios, but Arethas read him and probably commissioned a minuscule copy of the text (now lost), which in turn was read by Maximos Planudes (late 13th century) and Nikephoros

Gregoras (14th century); some excerpts are already found in the *Suda* lexicon. Around 1400 Arethas's manuscript came to Italy, establishing Pausanias' presence in the west, which was to be so valuable for archaeologists in the 19th and 20th centuries.

BALBINA BÄBLER

Biography

Born c.AD 115 to a wealthy family in Lydia, probably at Magnesia ad Sipylum, Pausanias was well educated. He had the resources to spend his life travelling and writing about his travels. He knew Asia Minor, Syria, Palestine, and Egypt; but his only surviving work is a "Guide to Greece" in ten books. Nothing is known of his life but he probably died c.180.

Pelion, Mount

Region in Thessaly

Mount Pelion, often referred to as the mountain of the centaurs, has been an inspiring place from antiquity to the present day. Its place in mythology is marked by many references in Homer, Pindar, the tragedians (especially Euripides), and Apollonius Rhodius. It is situated in central Greece, in Magnesia, north of Mount Ossa. It was believed to be the home of the centaur Chiron, the wisest of the centaurs, associated with the education of many heroes such as Heracles, Achilles, Jason, and Asclepius. In Hesiod's version of the Gigantomachy, Mount Olympus was challenged when the Giants tried to pile Pelion on Ossa. Jason used timber from Pelion in order to build the ship *Argo* for his voyage to Colchis with the other Argonauts to get the golden fleece. The marriage of Thetis and Peleus was celebrated

on Mount Pelion. Although it has an eminent position in Greek mythology, it was most probably not settled extensively in ancient times, except for some areas on the coast, e.g. Pagasae, Iolkos, Aphetae, Orminion, and, in Hellenistic times, Demetrias. There are, however, archaeological remains of sanctuaries, such as the temples to Zeus Akraios on the Pliasidi peak and to Apollo Koropaios at Boufa (on the west coast).

Pella

City in Macedonia

The fortunes of Pella, which became the chief city of the Macedonian kingdom, mirror those of the kingdom itself. The city was situated in the region known as Bottiaea, to the north of what was until quite recently the lake of Giannitsa, the ancient lake Lydias. This was originally an inlet of the sea, but the major rivers which flow into it, the Haliacmon, the Loudias, and the Axios, gradually caused it to silt up, and it was finally drained in the 1930s. In Classical times, in the 5th and 4th centuries BC, the southern part, near the original Macedonian centre of Aegae, had already silted, but there was still open water to the north, accessible from the sea by boats. There was no dry route across it from the south at this time, and the land route had to skirt the silted, marshy area. The incorporation of Bottiaea into the Macedonian kingdom, at an uncertain date before 500 BC, gave the Macedonians access to the Axios valley and the lands beyond, where there were rich silver mines, certainly exploited by the Macedonians in the reign of Alexander I, in the first half of the 5th century BC, though their hold on this region was somewhat precarious. As a result, the old centre of Aegae was in effect at one end of the Macedonian kingdom, and gained access to the extended territories only by the roundabout overland route. When at the end of the 5th century the king Archelaus sought to modernize and so strengthen his kingdom, one of his most important actions was to develop a new capital at

Pella, more in the centre of the extended state.

Not much is known about Archelaus' foundation. He built a palace on the low hill which seems to have functioned as the acropolis. The cemeteries of this city have been partly excavated, and their position suggests that the town extended only on the immediate slopes of this hill, to the south of it. The town was probably sacked (though there is no archaeological evidence for this as yet) by the Illyrians during their incursion in 359 BC, which almost destroyed the Macedonian state.

Under Philip II the Macedonian kingdom revived and reached unprecedented bounds, and with it, Pella. A new plan was laid out covering an area of at least 1.5×1.2 km, with the acropolis at the northern end, and the city extending down to the water's edge to the south. Within this a regular grid plan was laid out, with blocks measuring 110×48 m, running north to south and separated by streets some 6 m wide. On the flatter ground below the acropolis was the agora, a vast, near-square space 200.15×180.50 m. It was approached by a principal east-west street, noticeably wider than the others, an arrangement which seems to have been pioneered by the agora named after its town planner, Hippodamus, at Piraeus. This is town planning on a lavish scale. It is comparable, in general size, with the late 5th-century BC layout of Rhodes, but the detailed plan, with its repetition of blocks in the proportion 2:1, is not quite the same as Rhodes, where the blocks are subdivisions of square units demarcated by wider streets. The best antecedent for Pella seems to be the enlarged city of Olynthus (late 5th century) in Chalcidice, which is closer to hand and a more obvious model for town planners employed by Philip, even though he had destroyed the Greek city. Olynthus, however, does not have the large central agora. Evidence for the actual development of the city within this plan is as yet only partial. The agora was surrounded by stoas which seem to have been continuous on all four sides of it, with a double row of rooms behind them, some of which were certainly used as shops. The northern part may have been more official, the southern part commercial, the dividing line being the main road which passes through the colonnades into the central square. However, the architectural development of this agora appears to be relatively late, of the late 3rd century BC, the time of Philip V, rather than of the original layout by Philip II.

The most striking feature of Pella is undoubtedly a group of luxurious houses situated south of the agora. One of these, designated by its excavators the House of the Rape of Helen (from the subject of a scene depicted on one of its mosaic floors), occupied half of one of the street blocks. Its rooms were arranged round a large courtyard embellished by 8×8 Doric columns. The main rooms on the north

side, with the mosaics, were surmounted by an upper floor, with a gallery of Ionic columns overlooking the court. The House of Dionysus, two blocks to the east, was even larger, taking up two-thirds of a street block. A doorway with a two-column porch gave on to an entrance hall running east to west between two courtyards, that to the north with 6×6 Ionic columns, that to the south with 8×8 Doric. The north side, again, was surmounted by an upper floor, with, probably, another gallery overlooking the court. All the mosaics in these houses are splendid examples, with figure scenes, made from complete pebbles, the earlier system, rather than the cut tesserae used in late Hellenistic floors at Delos and elsewhere.

These houses are of a particular magnificence, and, as far as the archaeological evidence goes, without parallel in the Greek world. Yet at Pella they are only two among others, and though this may well represent the wealthiest part of the city, they should not be regarded as special or public buildings. What they indicate is the degree of wealth achieved in Macedon as a result of the conquests of Philip and Alexander, to which period, from their architecture and contents, they undoubtedly date. The House of the Rape of Helen measures nearly 50×50 m (actually 2350 sq m), that of Dionysus about 50×65 m (3160 sq m), in contrast to the houses in Olynthus, which are approximately 15×15 m (215 sq m). Houses of a similar scale to those of Pella are implied by the street plan of Hellenistic Alexandria, but are there associated with a layout rather of Rhodian type. Houses in other Classical cities, where evidence exists, are only of the same size as those at Olynthus.

Pella thus indicates a level of luxury beyond that of the Classical cities, the benefits, doubtless, of conquest and empire, but demonstrating what the Macedonian kings had achieved. This, in turn, makes clear some of the motivation behind the fact that not all the citizens of Athens (to name only one of the Classical cities defeated by Philip) were inclined to oppose collaboration with the Macedonians.

The agora shows signs of sudden and unexpected destruction. One of the shops was a potter's workshop, containing moulds for terracotta vases decorated in relief. The systems of decoration depict, among a variety of subjects, scenes from the Homeric poems. That they remain as they were stacked in the shop, and also the overthrown columns of the luxury houses demonstrate that the city was destroyed by an earthquake, rather than the hostility of the Romans at the conclusion of the Third Macedonian War or the subsequent insurrection. But in the longer term Pella was ruined rather by the silting up of the lake, and the rise of Thessalonica, more conveniently placed by the sea, to serve as the principal harbour town of Macedonia. Pella was virtually extinguished. The Romans developed a new town a short distance to

the west, but it never flourished. Thus Pella played only a brief part in the development of the Hellenic tradition. It was, however, a vital stage in a continuity which passed not only to Thessalonica, as its direct successor, but also to Alexandria as the outstanding city of the Hellenistic world.

Peloponnese

Region of southern Greece

The Peloponnese (Peloponnesus) is the southernmost part of the Greek mainland, and has an area of 21,439 sq km, which is 16.24 per cent of the total area of Greece. An island originally, it was twice united and separated from the mainland by intense geological upheavals. It is thought to have been named after the legendary hero Pelops and, although it is called *nesos* (island), implying that the entire region was thought of as an "island", i.e. a separate part of Greece, it is actually a broad peninsula. On the west, south, and east it is bordered by the Ionian, Mediterranean, and Aegean seas respectively; but it is connected to the mainland of central Greece (Attica and Boeotia) by the isthmus of Corinth, formed by a subsequent retreat of the sea. In the 19th century this land bridge was cut to make the Corinth Canal, which almost made the Peloponnese into an island once again. Physically, the land is rugged and mountainous in its interior, and settlement is largely confined to the coastal plains and river valleys. Most villages cling to the steep mountainsides while the valley floors are reserved for farming. Products include wheat, citrus fruits, olives, tobacco, figs, and grapes. However, the greater part of the Peloponnese is mountainous, uncultivable, and poor. Sheep and goats

of the pasturage and swine of the oakwoods are the main livestock that can be reared on about 50 per cent of the surface which consists of chalk and limestone. Climate and flora vary greatly according to the geographical and geological conditions: Arcadia and the east are almost entirely continental while the western parts are subject to maritime influences; the climate is purely Mediterranean along the coasts, but the centre has a relatively continental climate. In 1991 the population was 1,086,935, which is 10.59 per cent of the total population of Greece. It has been estimated that the civic population in 400 BC may have been 500,000 or 600,000.

The topography is complex. The north consists entirely of highland, from the lower mountain chains of the Argolid peninsula westwards successively through Cyllene (Ziria), Chelmos, Panachaicum, and to the south Erymanthus and Maenale towards the centre, all with extensive areas above 1500 m. Three chains run southwards from this mass, the lowest to the west beginning with Lykaion and running through Ithome to form the Messenian peninsula; Taygetus in the centre, with the highest summit of the Peloponnese (2409 m) forming the peninsula now called Mani, running to Cape Taenarum (Matapan); and Parnon to the east, running to Cape Malea. These parallel chains once formed part of the huge arc stretching from Albania through central Greece and Crete to Asia Minor. This original system was destroyed by the subsidence which created the large gulfs and most of the plains in the interior. In the Isthmian province and Argolid, as in the eastern parts of central Greece, the predominant direction of the ranges is west to east. The western and southern divisions of the Peloponnese are characterized by larger plains, forming a kind of counterweight to the smaller, closely enclosed plains, as around Tripolis, Mantinea and Arcadian Orchomenus, Pheneus, and Stymphalus. Along the north and west coasts are well-watered and well-drained terraces, the uplifted remnants of earlier coastal plains.

The eastern coastal plain, known as the Argolid, is dominated by the citadels of Argos and Mycenae. The fertile coastal strip in the north is divided into Corinth in the east and Achaëa in the west; it includes Patras, the important port city and centre of tourism and the wine trade. The monotonous plain of Elis (Ilia), which extends down the west coast, is partially composed of the alluvium deposited by the river Alpheus. The southern coast is split into three promontories, the largest of which, Mani, is an extension of the Taygetus massif. Taygetus is flanked by Laconia round Sparta and Messinia round Kalamata. Both are alluvial plains and are free from winter frost.

In spite of its being a virtual island and with deeply indented gulfs between the mountain chains providing some good harbours, the Peloponnese had little communication with the sea. Arcadia, which is

the most central of the regions, and whose pasturelands were 600–800 m above sea level, did not touch the sea at all and was nearly inaccessible. The Peloponnese had relatively few harbours and little or no hinterland except in the Argolid and Elis. Consequently, naval operations against the coast were rendered more difficult: hence the importance of Halieis for Athens and Argos during their alliance in the mid-5th century BC, and of Pylos and Methone. The capes were all dangerous, Malea notoriously so, as attested by authors belonging to different periods, such as Homer and Thucydides. The importance of Tiryns and Mycenae in Bronze Age Greece may have been due to the existence of an “isthmus” route from the Gulf of Argos to Corinth. Following the destruction of Tiryns and Mycenae, Argos began to develop and in the 7th century BC reached its peak as one of the most powerful cities in Greece.

The name Peloponnese does not appear in Homer, who knows the entire peninsula by the name of Argos, one of its well-known Mycenaean city states. The name is first attested in the *Cypria* (fr. 11, Allen), a poem belonging to the Trojan epic cycle and now preserved only in fragments. The next known occurrence is in the Homeric *Hymn to Apollo*. The philosopher Anaxagoras saw in it an appropriate unit to measure the size of the sun. The geographer Strabo, writing during the reign of the Roman emperor Augustus, devotes a considerable portion of his eighth book to the Peloponnese. During the latter part of the second millennium BC Mycenaean civilization flourished at centres such as Mycenae, Tiryns, and Pylos. The commercial and cultural influence of Crete, if not the political and military, began to be felt during the later part of the Mycenaean period, as shown by the Minoan-influenced design and decoration of palaces at Tiryns and Mycenae, and the impact of Minoan art revealed in the later shaft graves.

In historical times the Peloponnese consisted of six divisions: Achaea, Arcadia, Argolis, Elis, Laconia, and Messenia. These were separated from one another by mountains, and this fact hindered intercourse between them by land. Thanks largely to the landscape these regions maintained their identity throughout antiquity. Thus Elis was the region of the Alpheus plain and adjacent coasts. Achaea was made up of the steep northern valleys, their outfalls, and the coastal strip. Arcadia consisted of the central mountains and basins including the plain of Megalopolis. Messenia consisted of the southwestern peninsula and the Pamisus plain, while Laconia comprised the Eurotas valley and the southeastern peninsula. Corinth controlled the isthmus and its neighbourhood, while Argos dominated the plain. The Peloponnese was the home of several very powerful ancient city states, foremost among which were Sparta and Corinth. The decline of Greece’s golden age has been traced to the Peloponnesian War (431–

404 BC) fought between two factions led by Sparta and Athens, and admirably chronicled by Thucydides. The ensuing period was covered by Xenophon in his *Hellenica*. The complex and somewhat fragmentary topography may have been one factor that encouraged federalism and *sympoliteia* (union of states). The hegemony of Sparta promoted a regional solidarity, though it was never complete. Spartan domination of the Peloponnese was followed by Macedonian rule which ended with the Roman conquest of 146 BC. During the Hellenistic and Roman periods the southern coastal cities of Gythium and Methone played an increasingly important role as useful stations on long-haul east-west routes; and Methone, in particular, maintained its importance in this regard until the 19th century. It had been mentioned by Homer as being “rich in vines”, and was famous for its wine and bacon under the Venetians, who built a fort to protect the shipping route around the Peloponnese.

Historically, the Peloponnese is one of the most famous parts of Greece. It includes such well-known sites as Corinth, Epidaurus, Mistra, Mycenae, Olympia, and Sparta. It has the most varied ruins of ancient Greece, making it one of the best-known centres of tourism. It is therefore not at all surprising that Pausanias, in the latter half of the 2nd century AD, devotes the greater part of his *Guide to Greece* (books 2–8) to a description of the Peloponnese and its historic sites. Blessed with abundant physical beauty and replete with important archaeological sites, the Peloponnese is a land every corner of which evokes some ancient myth. Its cities, towns, and spas were important centres in antiquity and remain so to the present day.

Peloponnesian War 431–404_{BC}

The Peloponnesian War is the name given to the great conflict between Athens and Sparta and their respective allies that broke out in 431_{BC} and ended with the surrender of Athens in 404_{BC}. Warfare was not continuous: ten years of fighting (often called the Archidamian War after the Spartan king Archidamus II, who led the first three invasions of Attica) were concluded by the Peace of Nicias in 421_{BC}; eight years of uneasy peace and occasional clashes followed, during which the Athenians’ great Sicilian expedition was disastrously defeated (413_{BC}), before the peace was abrogated (also in 413) and the final phase, sometimes known as the Ionian War, began.

The Thirty Years’ Peace of winter 446/45_{BC}, which had ended the earlier period of sporadic warfare between Athens and Sparta, had removed all Athenian footholds from the Peloponnese and the isthmus of Corinth and appeared to regulate relations between the two states for the future. But the Athenians’ control of the subject allies that formed their empire was unimpaired and, when their continuing expansionism led them in 433_{BC} into actions over Corfu, Potidaea, and Megara that were not against the letter of the peace, but were seen by the Spartans’ most influential allies, the Corinthians, as against its spirit and hostile to themselves, the Spartans decided to go to war if the Athenians did not back down (late 432_{BC}). Despite some busy Spartan diplomacy, Pericles persuaded the Athenians to stand firm and hostilities began in spring 431_{BC}, with the Spartans widening the issues by demanding that the Athenians free their subject allies (Thucydides, 1. 139).

At the start the Spartans expected to achieve their aims quickly by invading Attica, provoking the Athenians into battle and defeating them, an expectation shared, says Thucydides (7. 28), by most other Greeks. But, although they led Peloponnesian armies into Attica in five of the first seven years of the war and did a great deal of damage to Athenian agriculture, they could not draw the Athenians out to fight, an assault on their fortifications being out of the question. Meanwhile any hopes they had of challenging Athenian naval power proved groundless. Without the resources to build and man a large enough fleet, they tried to obtain Persian help, but the Persians were not interested so long as Athenian naval power was unimpaired, and the same factor deterred Athens’ maritime allies from rebelling and transferring their money and rowers to support the Spartans; in the first ten years of the war just one of them, Lesbos, revolted in 428_{BC}

and in 427 BC learned the hard way that the Spartans could do nothing effective to help them. One area of the Athenian empire, the Chalcidice peninsula, was vulnerable to the Spartans' land power, but they were slow to exploit this advantage, despite the fact that the Corinthians had been able to send a small army to the area in 432 BC to help Potidaea and that the Potidaeans did hold out under siege until winter 430/ 29 BC, while other smaller rebels nearby were never subdued. Eventually in 424 BC Brasidas did take a force to Chalcidice and, despite having only 1,700 hoplites, who were volunteers and liberated helots, won over a number of the Athenians' allies and their substantial colony at Amphipolis.

The Athenians' unassailable fortifications and their dominant fleet kept them safe from immediate danger provided that they avoided major battles on land, but, despite Pericles' public confidence in their financial strength (Thucydides, 2. 13), they were not adequately funded for a long war. It is possible that Pericles, who evidently directed their strategy, planned to use the fleet for offensive operations and that the attack he led on Epidaurus in spring 430 BC was the beginning of them, but the onset of the plague at that moment put an end to any such notions. Lasting two and a half years, its severity was exacerbated by the congestion caused by refugees from the countryside, where the longest of the Peloponnesian invasions, lasting 40 days, was in progress, and it seems that overall the Athenians lost from it up to a third of their fighting men. In the short term their war effort was brought to a standstill and they unsuccessfully sent envoys to Sparta to negotiate terms for peace, before Pericles rallied them; he himself died of the plague in autumn 429 BC and thereafter, in Thucydides' view (2. 65), his steadying influence was sorely missed. The Spartans, however, failed to exploit the Athenians' difficulties and their recovery was spirited. They reacted vigorously to the revolt of Lesbos in 428 BC, raising 200 talents from the first ever property tax on citizens, and crushed it the following spring.

After some small-scale offensive operations in 427 and 426 BC, including the dispatch of 20 ships to support their allies in Sicily against the Syracusans, in the summer of 425 BC the Athenians won a major victory near Pylos in the southwest Peloponnese. A fleet of 40 ships en route for Sicily was used by the enterprising general Demosthenes to fortify a small peninsula. A Spartan attack on the fortifications failed, the Spartan fleet that entered the bay was defeated, and a Spartan force that was put on the island of Sphacteria at the bay's entrance was cut off. The Spartans thereupon obtained a truce, so that they could send envoys to Athens about peace, and were evidently ready to ignore the interests of their allies on whose behalf

they had claimed to go to war, in order to remove the Athenians and rescue their men. The Athenians, however, prudently demanded the concession of footholds on the isthmus and on Peloponnesian coasts that they had held before 446 BC as a guarantee that the Spartans would not renew the war within a few years once they had surrendered their advantage, and negotiations broke down. The Athenians then kept the Spartan ships that had been given as surety for the truce and later stormed Sphacteria, taking prisoner 292 hoplites, whom they held in Athens as hostages against any further invasions of Attica. Early the following summer (424 BC) they captured the island of Cythera, off the south coast of Laconia, and, using it and Pylos as bases for ravaging Spartan territory and as refuges for Spartan serfs, they had high hopes of victory; to pursue this, the previous winter they had decided to increase their revenue from their allies to about three times the prewar figure.

At this point, however, things went wrong for the Athenians. First, their 60 ships returned from Sicily unsuccessful after the Greek cities there had made peace with one another. Then an attempt to win over Megara, whose territory they had raided regularly since 431 BC, failed. This setback was not disastrous, but in the autumn an ambitious attack on Boeotia ended with a defeat in a pitched battle near the frontier close to Delium in which 1000 precious hoplites were lost. By this time Brasidas' small army had reached Chalcidice and was winning over allied cities, and, when he had crowned these successes with the capture of Amphipolis, the Athenians agreed to conclude a one-year truce (spring 423 BC). Although it did not lead, as the Spartans hoped, to a permanent peace, there was little fighting in southern Greece when it expired. The Athenians concentrated on trying to recover lost allies in Chalcidice; first Nicias and then Cleon had some success, but, when the latter was defeated and killed in a battle outside Amphipolis, in which Brasidas also perished, they too were ready to compromise.

The treaty as agreed in spring 421 BC, the Peace of Nicias, provided *inter alia* for the return of prisoners, the withdrawal of the Athenians from Pylos and Cythera, and the restoration to them of Amphipolis and their revenues from Chalcidice, but its terms were never fully implemented. The Athenians gave back the prisoners from Sphacteria, but, because the Spartans could neither force the Amphipolitans to return to their control nor persuade other important allies, including Corinth and Thebes, to ratify the treaty, they kept Pylos and Cythera. In a flurry of diplomatic activity, which led to some renewed warfare, it looked at one time as if Sparta and Athens might combine against the former's allies; and then that the Spartans might be defeated by a combination of the hitherto neutral Argives and other disaffected

allies, Elis and Mantinea, backed to some extent by Athens; but the Spartans won a crucial battle near Mantinea in 418 BC and recovered the leadership of the Peloponnese, although the Argives remained allies of Athens.

Athenians had fought at Mantinea, but the peace remained in force with neither side eager to resume full-scale war. Nevertheless, the Athenians were still restless and, disinclined to do the hard work necessary to recover Amphipolis and their control of the north, their thoughts turned to Sicily, where, according to Thucydides (3. 86 and 4. 65), they had conquest in mind when sending the ships in 427 and 425 BC. In the spring of 415 BC, lured by an appeal from non-Greek Segesta, they voted to send a fleet of 100 triremes and an army to the island under Nicias, Alcibiades, and Lamachus in the hope that they would conquer it and use its resources to achieve final victory over the Spartans at home.

Despite a slow and indecisive start, the recall of Alcibiades to face a charge of sacrilege and the death in battle of Lamachus, the Athenians in summer 414 BC were about to put Syracuse under siege and it seemed likely to surrender, but the arrival of Gylippus, sent out by the Spartans, on the advice of the exiled Alcibiades, to organize the city's defence, turned the tide and in the winter the Athenians became more besieged than besiegers. Nicias recommended the recall of the expedition, but the people at home preferred to send substantial reinforcements (spring 413 BC). This was to no avail, because the Athenians failed to regain the initiative and, with the Syracusans establishing naval superiority and Nicias unwilling to agree to withdrawal without the people's approval, the whole force was destroyed.

This defeat was catastrophic for the Athenians, not only for the losses of men, ships, and money, but also for its consequences in the Greek homeland. The Spartans had already declared the war renewed and established a garrison at Decelea in northern Attica that served as a base for year-round ravaging and a refuge for some 20,000 slaves over the remaining years of the war. They now began to send fleets into the Aegean, where the destruction of Athens' naval power was encouraging its allies to revolt and the Persians to intervene in the hope of recovering control of the Asiatic Greeks.

The Athenians, however, despite internal discord, fought back, matching the Spartans almost ship for ship, limiting the revolts of allies and recovering some cities, while the Persians restricted their commitment to intermittent financial backing of the Spartan navy, even when in winter 412/11 BC the western satraps guaranteed their support in a treaty in which the Spartans recognized the Persian king's right to rule over all the Asiatic mainland. The Athenians indeed

survived a shortlived oligarchic revolution in the summer of 411 BC and their fleet, which had remained loyal to democracy and had shrewdly accepted Alcibiades back from exile to join its leaders, won two battles, in the second of which, off Cyzicus in the Propontis (Sea of Marmora) in the summer of 410 BC, all the Spartan ships were destroyed or taken.

A Spartan peace offer was now rejected and the Athenians pressed on with the recovery of lost allies, but the process was incomplete in 407 BC, when the arrival in the eastern Aegean of a competent Spartan admiral, Lysander, coincided with the Persian king's appointment of his son Cyrus to take charge in the west and make effective his support of the Spartans. Lysander's victory at Notium led to Alcibiades' withdrawal into exile, an indication of continuing dissension at Athens. This again showed itself in 406 BC, when, after the Athenians had defeated Lysander's successor off the Arginusae islands, eight of their victorious generals were prosecuted for failing to pick up the survivors in a storm and six of them were executed. Then in 405 BC Lysander was restored to the command, lured the Athenian fleet into the Hellespont (Dardanelles), and in a surprise attack took 170 of their 180 ships almost without a fight, as they were beached for the night near Aegospotami. It was the decisive blow. Up to this point the war could still have ended in stalemate or even victory for the Athenians, but these were their last ships and now Lysander cut their corn-supply lifeline, took over their allies, and expelled their colonists from the Aegean and then joined in the siege of Athens, which ended inevitably in surrender (spring 404 BC). Some of the Spartans' allies wanted Athens destroyed, but Sparta was content to reduce the Athenians to the status of a subject ally, with most of their fortifications demolished and, soon after, their democracy replaced by a repressive pro-Spartan oligarchy.

The war has always been seen as a turning point in the history of ancient Greece. Both protagonists, the victors as much as the vanquished, were irremediably weakened. A serious shortage of manpower combined with defects of character and judgement to bring down the Spartans' new Aegean empire within ten years and only Persian support enabled them to keep their control of the Peloponnese as far as 370 BC. The Athenians recovered remarkably and briefly were again the leading city, but they lacked not only the wealth, but also the vigour and dynamism of their 5th-century BC ancestors. Neither of these states nor the Thebans, whose strength and confidence grew significantly during the war, could effectively unite Greece against the expansion of Macedonian power under Philip II. In 338 BC he defeated the combined army of Athens and Thebes at Chaeronea and then could afford simply to ignore the Spartans' refusal to join in his

settlement of Greek affairs.

This was certainly a sorry episode in Greek history not only for the long-term damage it inflicted on Greek freedom, but also for the extremes of cruelty practised by some of its participants. In 427 BC the Spartans killed all the surviving defenders of Plataea, an ally of Athens, when they surrendered; in 421 BC the Athenians did the same to Scione, a rebellious ally; and in 416 BC, during the formal period of peace and following no known act of recent hostility by the victims, they attacked Melos and on its surrender killed all the men of fighting age and sold the rest of the population into slavery; in 413 BC the Syracusans butchered many defenceless Athenians in the final disaster and sent the rest to the stone quarries. Other atrocities were committed when within cities the partisans of the two protagonists clashed in bitter civil strife (*stasis*), most notably at Corfu in 427 BC.

In contrast to these barbarities were the admirable doggedness and heroism of the defenders of Plataea (429–427 BC) and especially the remarkably resilient spirit of the Athenians that enabled them to recover from the plague of 430–428 BC and the Sicilian disaster of 413 BC. Remarkable too were their continued public patronage and enjoyment of art and drama through the times of crisis right to the end. The Erechtheum on the Acropolis was built during the war and many of the surviving tragedies of Euripides, some of those of Sophocles, and 9 of Aristophanes' 11 extant comedies come from these years, performed at public festivals at public expense. The war, however, provided the essential comic situations of Aristophanes' *Acharnians* (425 BC), *Peace* (421 BC), and *Lysistrata* (411 BC), and the tragic consequences of warfare were vividly echoed in Euripides' *Troades* (415 BC) and *Hecuba* (c. 424 BC). But its greatest contribution to the development of the Hellenic tradition was in inspiring Thucydides to write his history. With his strict sense of relevance and careful collection and treatment of information he set standards of objectivity and scientific analysis that no other ancient historian, Greek or Roman, could match, while at the same time being a master of dramatic narrative and at conveying the tragic quality of history.

Pergamum

City in northwest Asia Minor

Pergamum was the elegant capital of the Hellenistic kingdom of the same name that was founded by the Attalid dynasty in the early 3rd century BC. The city, in the region of ancient Mysia in northwestern Turkey, was c.20 km from the sea and was connected to its port at Elaea by the Caicus river. Pottery sherds show that there was Greek settlement at this site as early as the 8th century BC; in the early 5th century BC when the territory was under Persian control its governor was a Greek from Eretria. After the conquests of Alexander the Great in the late 4th century BC, Lysimachus, one of Alexander's successors, took Pergamum as part of his kingdom. He deposited a sizeable portion of his royal treasury there under the care of his general Philetaerus. In 281 BC Lysimachus was killed in battle, and Philetaerus, seizing the moment and the treasury, installed himself as ruler of the new kingdom of Pergamum and founder of the Attalid dynasty. With Athens having been in decline since the 4th century BC, the Attalids set as their goal the preservation of Classical civilization and Pergamum was to be a new Athens, the centre of Greek culture and art. During the reign of the fourth Attalid king, Eumenes II (197–159 BC), Pergamum was transformed from a modest Greek city into a magnificent Hellenistic metropolis with a population of more than 100,000 people. When the last king, Attalus III, ceded his estates to Rome in his will in 133 BC, Pergamum became the capital of the Roman province of Asia. The city continued to grow under the Romans and, at its peak in the 2nd century AD, the population was

about 150,000.

The site is divided into two areas – a lofty acropolis (c.400 m high) and the plain surrounding it. Remains of numerous public buildings and private houses are found in both areas. The walled citadel was terraced from north to south providing building levels that were connected by a winding road. With the exception of a few andesite structures, the view from the plain was of white marble Hellenistic and Roman buildings rising one above the other. At the summit, an aqueduct supplied water that was piped to public fountains, baths, and private dwellings. Nearby were military barracks, storerooms, a large temple honouring the deified Roman emperor Trajan (AD 98–117), and the “palaces” of the Attalid kings, which were merely large peristyle houses. On the second terrace was the sanctuary of Athena, honouring the patron deity of the city, which contained a small 3rd-century BC andesite Doric temple surrounded by spectacularly carved 2nd-century BC marble stoas. The north stoa provided access to the renowned Pergamene library. Behind the library and the Athena sanctuary, built into the steep southwest face of the citadel, is the precipitous theatre (it has the steepest *cavea* of all Greek theatres), with seating for 10,000 persons. The area at the base of the theatre is so narrow that the wooden stage building was removed when not in use so that it would not impede pedestrian movement. On the third terrace is the foundation of the Pergamum Altar (c.165 BC), arguably the most spectacular of all monuments from the Hellenistic period. This large square marble structure (c.35 × 35 m), which has been partially reconstructed in the Berlin Museum, consisted of a tall podium adorned with over-lifesized figures in very high relief depicting the Battle of the Gods and the Giants. A broad staircase led up to an Ionic peristyle court behind whose columns was a lengthy relief showing the life of the hero Telephus, mythic founder of Pergamum and adopted ancestor of the Attalids. The function of the “Altar” has been debated since its excavation in the late 19th century. Is it an altar, a victory monument, a dynastic monument, or a *heroon* (i.e. a cult building for the worship of a hero)? The monument is in the form of a sacrificial altar (although it is much larger than all other examples) and the sculptural themes can be related to Attalid military victories and the political achievements of the dynasty. The lengthy relief telling the story of Telephus suggests most strongly, however, that its primary function was as his *heroon* (Webb, 1998). Among the remaining buildings on the terraced citadel are the *heroon* of the deified Attalid kings and several large complexes including the upper market or agora, the sanctuary of Demeter, the sanctuary of Hera, three gymnasia, large public baths, and the lower agora. There were also private houses, individual shops, small public baths, workshops, a

tavern, and other establishments important to everyday life. At the base of the citadel was the main gate in the city wall.

The city in the plain was built primarily in the Roman period and contained a stadium, an amphitheatre seating 50,000, a theatre seating 30,000, various smaller public buildings, houses, tombs, and the vast temple of the Egyptian gods. From the area of the theatre a colonnaded street led to the famed healing centre, the sanctuary of Asclepius. The cult at Pergamum, founded in the 4th century BC, experienced continuous expansion and by the 2nd century AD the Asclepieum was the principal healing centre in Asia Minor. Medical treatment incorporated physical therapies, e.g. diet, exercise, baths, etc., but also spiritual procedures, e.g. incubation (dream therapy). The huge complex consisted of a large colonnaded court around and within which were temples, a library, a theatre seating 3500, fountains, pools, men's and women's latrines, sleeping rooms for incubation, and a large treatment building.

Pergamum declined as the power of the Roman empire waned in the 3rd century AD. The buildings on the lower acropolis, in the surrounding plain, and the sanctuary of Asclepius were abandoned with the exception of the temple of the Egyptian gods, which was converted into a Christian basilica. The upper acropolis continued in use, but comprised mostly modest houses built into and over the ancient structures. The city suffered severe damage from foreign invaders on a number of occasions, and the upper acropolis was refortified at least three times – in the 3rd, 7th, and 12th centuries. Even though Pergamum was home to one the “seven churches” of Asia Minor (Revelation 1: 11), was a major intellectual centre until the end of the 4th century, and was made a bishopric at the end of the 14th century, it had a small population and was relatively obscure throughout the Byzantine period. When the future emperor Theodore Laskaris visited the site in the mid-13th century, he recalled the greatness of the ancient city and equated the contemporary poorly constructed dwellings that lined the narrow streets to mouseholes in houses.

While the city of Pergamum as a whole was the glory of the Attalids, and the Pergamum Altar is the most important structure for modern admirers of the dynasty's accomplishments, the building that was central to Pergamum's role in the preservation of Classical civilization was the library. Second only to the library at Alexandria in the ancient world, it is estimated to have owned 200,000 volumes. Since the kings supported scholars in all the academic disciplines, one can assume that the holdings consisted of works representing the entire range of Greek learning. It is not clear what eventually happened to the contents of the library. In his *Life of Mark Antony*

Plutarch relates a story that Antony gave the entire collection to Cleopatra as a gift. But Plutarch himself is unsure of the story's veracity, and there is no evidence that it is true. Since Pergamum continued as a centre of scholarly pursuits for four centuries after the deaths of Antony and Cleopatra, it is likely that at least a portion of the ancient collection remained intact during that period. In connection with the development of the library, Pergamum was also famous for the production of parchment, which eventually replaced papyrus as the preferred writing material in antiquity. Contrary to Varro's account (Pliny, *Naturalis Historia*, 13. 70), the Pergamenes did not invent parchment, for treated animal skin was used as a writing material very early in the Near East, and Herodotus (5. 58) mentions that it was used by the Ionian Greeks in the 6th century BC (Finegan, 1959, pp. 390–99). It is likely that Pergamum's reputation was based on the fine quality and large quantities it produced not only for consumption at home but also for export to Rome. The increased use of parchment facilitated the development of the more convenient and accessible codex (paged book), which supplanted papyrus and parchment rolls by the 4th century AD.

Pericles c.492–429 BC

Athenian statesman

Pericles was born around 492 BC. His mother's family, the Alcmaeonidae, had been prominent in Athenian politics throughout most of the 6th century BC. His maternal great uncle Cleisthenes held the office of eponymous archon in 525 BC. The family spearheaded efforts to overthrow the tyranny held by Pisistratus' sons. That accomplished, Cleisthenes "took the common people into his political coterie" (to paraphrase Herodotus) and reformed the constitution.

Pericles' father Xanthippus was a hero of the Persian Wars. He showed himself to be firm, even ruthless, in siege operations against a Persian garrison at Sestos on the Hellespont. Earlier in his career he had prosecuted Miltiades, a prominent member of a rival family, and very nearly got him condemned to death. This antagonism between the two families was to continue into the next generation.

If we are to believe Plutarch, a certain shyness, a degree of social reticence, seems to have been one trait of Pericles' personality. For his entry into the public sphere Pericles acted as *choregos*, financial backer, for Aeschylus' drama about the Persian Wars, *Persians* (472 BC). Although Themistocles is not named, his spirit pervades the play. Themistocles had shrewdly foreseen the importance of maintaining an effective fleet of warships, and he persuaded the Athenian voters to forgo a onetime dole so that such a fleet could be built. Pericles was later to make maritime invulnerability the cornerstone of Athenian policy.

Pericles' first serious political opponent was Miltiades' son Cimon. As a general and public figure he garnered personal support through private largesse and especially by using war booty to improve the city's appearance and amenities. From him Pericles appears to have learned that such benefactions were a sure way to win votes.

Cimon was by disposition conservative and had a personal affinity for things Spartan. After a stunning series of victories against the Persian forces he made two serious mistakes. He laid himself open to charges of mismanagement after completing a lengthy campaign to bring a powerful rebel state, Thasos, back into the alliance. Pericles was among Cimon's prosecutors, but the attack failed (463 BC). Sparta was also reeling from the aftermath of an earthquake. Its numerous subject class, the helots, had revolted and the Spartans called on the Athenians for help. Cimon led a large Athenian force to aid Sparta, Athens' "yokemate", as he termed it, but when these troops were inexplicably sent away, the people's anger turned against him and he was ostracized, that is, obliged to leave Athens for a ten-year period. Pericles and a political associate, Ephialtes, saw their chance to carry out a reform of the senior judicial council at Athens, the Areopagus. This reform signalled a change in the direction of Athenian politics: from now on more power was to be wielded by the common people,

and probably at this time the ordinary citizens who sat on the numerous Athenian juries were given a stipendiary daily allowance for the days when the courts were in session.

Athens' foreign policy suffered a serious setback in 454 BC. A revolt by a Libyan prince from the Persian empire failed, and two separate Athenian and allied support expeditions were lost. If Pericles supported the venture, the debacle appears not to have been brought up against him. During this period he was also taking careful note of the successes of other prominent Athenian commanders, such as Myronides and Tolmides. In 455 BC the latter led an Athenian naval force around the Peloponnese, and won some important victories. Not to be outshone, a few years later Pericles led a similar force that tried with only limited success to establish an Athenian presence in northwest Greece. Pericles may also have learned from Tolmides the advantages to be gained from the system of "cleruchies", pockets of Athenian settlers sent out to troublespots to prop up Athens' interests. In 451 BC Pericles sponsored a measure to restrict Athenian citizenship to those who could prove that both their mother and their father were citizens. What Pericles hoped to achieve by this measure is uncertain.

By the mid-5th century BC Pericles had a clearly formed vision of Athens as head of a maritime empire so powerful that the Spartans would have to concede superiority to the Athenians. His ambitions were fuelled by the huge financial surplus in the treasury of the Delian League, since 454 BC (probably) housed in Athens. Against strident opposition from such conservatives as Thucydides, son of Melesias, who was possibly related to Thucydides the historian, Pericles proposed that some of the money should be diverted to pay for an extensive building programme. The sources name Pericles himself in connection with a few of the projects, especially the statue of *Athena Parthenos* ("the Maiden"), executed by the Athenian sculptor Phidias, and an elaborate new odeum, a music hall that abutted the theatre of Dionysus, and it seems clear that he was the driving force behind the whole enterprise. These vast public works were intended not only to beautify Athens but also to give employment to its people. An estimated two to three thousand individuals were continuously employed over a period of 16 years, from 447 BC to the outbreak of the war with the Peloponnesians in 431 BC.

Some ancient sources assert that a formal peace was concluded between Athens and its allies and the king of Persia. A formal treaty around 449 BC would make it easier to explain the freedom that Pericles felt in applying to the building programme funds collected for military purposes. On the other hand, several ancient authorities claimed that the inscription purporting to record the peace was a forgery. Whatever the truth of the matter, there was a cessation of

hostilities after some important successes against the Persians around 450 BC by league forces under Cimon (now returned from ostracism), so that Pericles would not have been taking a great risk in redirecting part of the league's war chest to other purposes.

In 449 BC or 448 BC the Spartans launched a "Sacred War" to defend (as they claimed) the Delphians' claims to be supervisors of Apollo's shrine. Pericles responded with a counterexpedition that restored control to the original claimants, the Phocians, with whom Athens had entered into an alliance some years before. Inscriptional and other evidence suggests serious disaffection among the allies, especially in Ionia, in the late 450s BC. In every case Athens was quick to react, by armed intervention and other means. Although the sources do not connect Pericles' name directly with any of these measures, there can be little doubt that he was prepared to take all necessary steps to see that the allies were kept tightly under Athens' control. In 446/45 BC two important nearby states, Megara and Euboea, rebelled. Pericles responded with quick military action and both revolts were quashed. A Peloponnesian force that had advanced as far as Eleusis to lend support to the rebels returned home without having accomplished anything, and in the upshot a treaty of peace for 30 years was signed between the two superpowers: Athens repudiated claims to certain areas in the Peloponnese and Acarnania in northwest Greece, and in effect agreed to extend its empire only by sea. A sop had been thrown to the Spartan Cerberus, but it was becoming increasingly clear that it would not remain permanently quiescent.

In 440 BC Athens' powerful island ally Samos revolted. Again, Pericles' response was quick and tough. After several naval engagements and a protracted siege, the rebels were brought to heel. One of Pericles' colleagues for the first year of the campaign was the dramatist Sophocles, and several anecdotes survive of the shared command. Samos' longterm rival, Miletus, had figured in the preliminaries to the war, and this gave the gossipmongers and the comic poets a golden opportunity to spread the report that Pericles had got Athens involved as a personal favour to his mistress, Aspasia, who had originally come from Miletus; he had been in a relationship with her for some years after his own marriage to an aristocratic lady, not named by our sources, had broken down. By Aspasia Pericles had an illegitimate son, Pericles the Younger.

By the early 430s BC war between Athens and Sparta and their respective allies appeared inevitable. Athens responded to various provocative incidents with increasing firmness, and Pericles himself threw down the gauntlet with one or more decrees intended to cripple commercially the neighbouring state of Megara, an erstwhile ally of Athens but whose culture and language linked it firmly with Dorian

Sparta. The Spartan side voted for war in the spring of 432 BC and invaded Attica a year later. Pericles himself survived the war's outbreak by only two years, succumbing in the autumn of 429 BC to the effects of a plague of a now unspecifiable type. Pericles' own strategy of defence was partly to blame. He persuaded the Athenians who lived in the countryside – a substantial portion of the populace, according to Thucydides – to move to the city and refuse any challenge to a land battle. Such an encounter would inevitably be to the advantage of the Spartans, who had a near-perfect record in infantry fighting. Although the Athenians did not abandon Pericles' defensive strategy, out of intense frustration at their sufferings they briefly removed him from the generalship, only to reinstate him shortly afterwards. With a break of only a few years after 421 BC, when a peace treaty between the combatants was nominally in effect, the war dragged on until the Athenians had to witness not only defeat but the humiliation of looking on as their fortifications were dismantled by a Spartan occupying force in 404 BC.

The sources make out Pericles to have been a competent and popular general, but probably not a brilliant one. He had rivals, generals such as Tolmides and Myronides, whose achievements might have become part of the permanent record had they had their own eulogists, and he had colleagues in the generalship, men such as Hagnon and Phormion, in whose selection Pericles perhaps had a hand and on whose abilities and loyalty he knew he could rely. But the real reasons for Pericles' enormous popularity – he was reportedly re-elected to the generalship continuously from about 443 BC until his death – was that he had a vision of Athens' potential for greatness and he knew how to achieve it in practice. He possessed outstanding oratorical skills, a speaker on whose lips, to paraphrase the comic poet Eupolis, a kind of persuasiveness settled enabling him to outstrip his rivals like a champion runner. Above all, he was acknowledged as a man of personal and financial integrity. Plutarch crowns his praise by remarking that Pericles “did not increase the property left to him by his father by one drachma”, in marked contrast to what was believed about other popular leaders. His death at a critical moment in the history of Athens was a cruel stroke, with parallels on the contemporary Athenian tragic stage.

“The Periclean age” has become a useful label for Athens in the period 460–430 BC, a time of outstanding achievement in drama, philosophy, architecture, and the plastic arts. It may be an overstatement to say that Pericles was personally responsible, but it can hardly be denied that Athens' accomplishments were due in large part to the high degree of material prosperity that control of its empire had brought to the city, to his vision of what could be

achieved through wise use of public funds, and to his firm hand at the tiller of the city's affairs. His carping critics might call it a tyranny, but in fact it was responsible democratic government in which the individual most fitted to lead was given a mandate by the citizens to lead them, and for a period of sufficient duration that his best expectations of them were given the chance to be realized.

Biography

Born c.492 BC the son of Xanthippus and great-nephew of Cleisthenes, Pericles was *choregos* (financial backer) for Aeschylus' *Persians* in 472. BC. In 463 he was among the prosecutors of Cimon. After the ostracism and death of Ephialtes, Pericles became the popular leader of Athens. His vision was of Athens at the head of a maritime empire. He instituted a vast programme of public building works. His ambitions for Athens led to the outbreak of the Peloponnesian War. He died of plague in 429 BC.

Persian Wars

The Persian Wars are usually taken to refer to the two Persian expeditions to Greece in 490 BC and 480/79 BC. They imply that a continuous state of war existed between Greece and Persia during this period, thus portraying Persia as being preoccupied with the subjection of Greece. In fact, a distinction should be made between the campaign of 490 BC, under the command of two Persians, Datis and Artaphernes, and the invasion of 480/79 BC, led by the king, Xerxes. The campaign of 490 BC should be seen as a direct reaction to the involvement of Athens and the Euboean city of Eretria in the uprising of the Greek cities of Ionia, known as the Ionian Revolt (499–492 BC);

the expedition of 480/79 BC was a Persian invasion, prepared on a large military scale and led by the king himself. The term “Graeco-Persian war” would perhaps more accurately describe the military aggression of 480/79 BC.

In 499/98 BC, under the leadership of Aristagoras, tyrant of Miletus, some of the Greek cities of Ionia revolted against Persia. By the time of the Ionian Revolt, tyrannical rule in the Greek cities of Asia Minor, which were under the control of the Lydian kingdom, was already established as the favoured form of government, and it continued after the Persian conquest of Lydia in 546 BC. This was in line with the Persian policy of allowing local forms of government, language, culture, and religion of the different peoples of the empire to continue, and through this policy of political tolerance limiting resistance to Persian rule. Aristagoras had been approached by exiles from Naxos to help them regain power on the island; after having obtained the approval of the Persian king Darius I (522–486) and of Artaphernes, the Persian satrap of Lydia and brother of Darius I, he left for Naxos. If successful, this campaign would increase Persian political influence in the Aegean, and establish Aristagoras’ personal standing with the king. However, after an unsuccessful siege, which lasted four months, the Persians were forced to leave Naxos, and Aristagoras, faced with the personal consequences of the failed expedition, revolted against Persia, abandoning tyrannical rule in favour of *isonomia* (equal rule), with the intention of gaining popular support from other Greek cities for his revolt. His attempts to win Spartan support for his movement failed when the Spartan king Cleomenes refused to become involved in a military conflict overseas. Only Athens and the Euboean city of Eretria offered support, sending 20 and five ships respectively. This fleet arrived in Miletus in the spring of 498 BC, and a first attack was directed against the Lydian capital Sardis. The city was successfully defended by Persians and Lydians, but when a fire broke out the city quickly burnt down. A battle near Ephesus initiated by the Persians and Lydians against the Ionians forced the Ionians to retreat to their respective cities (Herodotus, 5. 102). After this defeat the Athenians and Eretrians abandoned the revolt and returned to Greece.

Gathering momentum, the revolt now spread to cities in the Hellespont, Caria, and Cyprus. Here the rebel Onesilus was killed, probably in the summer of 497 BC, forcing the Ionian ships to leave the island. Between 497 BC and 496 BC Daurises and Hymaees, both sons-in-law of Darius I, successfully fought the rebellious cities in the Hellespont, while Artaphernes and Otanes launched attacks in Caria. Aristagoras, having lost control over the revolt, fled to Myrcinus in Thrace, where he was killed (Thucydides, 4. 102. 2–3).

Persian military and naval forces retaliated with a battle off the coast near Lade and an attack on Miletus, which was taken in 494/93 BC. Its inhabitants were taken to Susa and resettled near the Red Sea. Following Miletus' defeat, other cities surrendered, and part of their population likewise was taken to Persia. In 493 BC Artaphernes began the reorganization of Ionia, and in the spring of 492 BC Mardonius, son-in-law of Darius I, was sent to Asia Minor to continue implementing political reforms of the cities of Ionia (Herodotus, 6. 43). Although Herodotus tells us that Mardonius introduced democracy to the cities of Asia Minor, we know of at least two cities, Lampsacus and Samos, which continued their tyrannical rule after 492 BC.

In preparation for a punitive campaign to be led against Athens and Eretria, the Persian king sent an embassy to Greece in 491 BC demanding from the individual states earth and water, the symbolic signs of the recognition of Persian supremacy. Thrace, Macedon, Thasos, Aegina, and other islands complied with this demand, but neither Athens nor Sparta submitted. In 490 BC the campaign was led by Datis and Artaphernes, the son of Artaphernes (Herodotus, 7. 74). Their first target was Naxos, which, offering no resistance, was burnt and looted. From there they proceeded to Eretria and took the city after a seven-day siege (Herodotus, 6.100–01). A few days later the Persian fleet landed near Marathon, upon the advice of Hippias, the former Athenian tyrant who had found exile in Persia, and who now acted as adviser to the Persians. In the ensuing battle the Persians were defeated by the Athenians, who were under the command of Miltiades. Retreating to Phalerum, the Persians then decided to abandon the attack and to return home. Neither Herodotus' account of the battle nor his casualty figures (6400 Persian dead, but only 192 Athenians) can be given any credibility. While Plataea had sent 600 soldiers in support of the Athenians, Spartan forces arrived a day after the battle.

The Battle of Marathon marked the first military encounter between Greeks and Persians on the Greek mainland, and, although it was won through favourable circumstances and good fortune rather than by military superiority, it had a huge ideological impact on the Greeks. For the Persians, their punitive mission had been successful as far as Naxos and Eretria were concerned. Persian interest in Naxos in 499 BC and the retaliation of 490 BC in fact identify the Persian objectives for their military action, i.e. to assert Persian control in the Aegean. In this regard the campaign of Datis and Artaphernes had been successful. The limited military force used in this campaign, the fact that Darius I had sent envoys to demand earth and water from the Greek cities in order to avoid involving other Greek states, and the

fact that the king himself did not participate in this campaign do not allow us to argue that the Persian campaign of 490 BC had been an attempt to subject Greece as part of an expansionist plan.

Nevertheless, Athens still had to be punished, and it meant that a new expedition was prepared over the next four years in which Darius I gathered an army from all parts of the empire, while the king's fleet was prepared and transport vessels were built (Herodotus, 7. 1). But in 486 BC a revolt which broke out in Egypt claimed priority; because Darius had died, aged 66, in December of that year, it fell to Darius' son and successor Xerxes to quash this revolt, which he successfully did by 485/ 84 BC. Xerxes then turned his attention to the expedition to Greece, carrying out his father's military plans. In 482/81 BC he probably also quashed a revolt in Babylonia under Belshimanni. In Greece the victory at Marathon had not resulted in the political unity of Greek states. A war between Athens and Aegina had broken out and lasted until 481 BC. Themistocles' proposal of 483/82 BC to build an Athenian fleet was accepted as a military plan against Aegina, and was on a par with the fortification of the Piraeus, the Athenian harbour, which Themistocles had advocated during his archonship ten years previously. The discovery of the silver mines at Laurium in 483/82 BC meant that Themistocles now possessed the finances to back his plan. At the same time Persian preparations for a military attack on Greece began. First, Persian envoys were sent to Greece to demand earth and water, which were offered by Thessaly, the people from the Malian Gulf, Locris, Thebes, and Boeotia. No ambassadors were sent to either Sparta or Athens. After Xerxes had gathered his army in Sardis, he crossed the Hellespont and marched via Dorsicus to Therma in Thessaly (Herodotus, 7. 127–31). At the battle of Thermopylae, which was fought on land, the Persians defeated the Spartan troops under the command of Leonidas, but a naval battle fought off Cape Artemisium on the same day was indecisive, the Persian fleet having suffered heavy losses in a storm, and the Athenians withdrawing their ships to Salamis after three days of battle. The Persian army advanced through Phocis and Boeotia to Attica and seized the Acropolis of Athens, the inhabitants already having been evacuated to Salamis and Troezen. With Attica under Persian control the Peloponnesians began building fortifications at the isthmus of Corinth, and those Peloponnesians who were still in Attica abandoned their positions. In September 480 BC Xerxes attacked the Greek navy at Salamis but the narrow straits made it impossible for the large Persian vessels to operate and they suffered heavy losses. Xerxes withdrew his naval forces, which returned to Cyme and Samos, but Mardonius and 10,000 elite soldiers were left to continue the war on land, and to destroy the Peloponnesian fortifications in the next campaigning season. Through

a Persian ally, Alexander of Macedon, Mardonius offered the Athenians a peace agreement, including the promise to rebuild the destroyed temples, but the Athenians refused. In the spring of 479 BC, after wintering in Thessaly, Mardonius proceeded through Boeotia without any opposition and retook Athens. The Athenians, having received no support from Sparta, had to evacuate the city again. A second envoy, Murychides, was sent to the Athenians, but he also failed to persuade them to accept the peace. Faced with an Athenian ultimatum, the Spartans finally sent 5000 Spartiates, 35,000 helots, and 5000 *perioikoi* (dwellers in dependent towns). At the ensuing Battle of Plataea Mardonius was killed and his death decided the outcome of the battle. The Spartans took the Persian camp and forced Thebes, who had remained loyal to Persia, to surrender. Their main Persian supporters were sent to Corinth and killed. The Persian troops, now led by Artabazus, returned via Thrace, Macedon, and Byzantium to Persia.

In Asia Minor, Chios and Samos began a revolt when the Spartan king Leotychidas was asked by six Chians to assist in a conspiracy against the tyrant Strattis, while on Samos people turned against Theomestor. In the face of the approaching Greek fleet on Samos Xerxes withdrew his naval forces to Mycale, where a battle with the Greek forces caused the defeat of the Persian army. The battle of Mycale marked the end of the Greek–Persian war of 480/79 BC. Over the next three years Samos, Byzantium, and the Hellespont were taken by the Greeks. For Xerxes his unsuccessful expedition to Greece had no repercussions in the Persian empire, where he continued to rule until his death in 465 BC, while for the Greeks the Persian Wars soon acquired the status of myth, laden with ideological propaganda. This was the beginning of Greek nationalism, marked by the Greeks' identification of themselves as Hellenes and the Persians as barbarians. In fact, neither during the period of 490 to 480/79 BC nor during the actual war of 480/79 BC had Greek political unity ever existed. Some Greek states had remained allies of Persia throughout that period, and during 480/79 BC the Greek states hardly acted as a unified force against Persia. The political rift between the anti-Persian Aris-tides, who initiated the Delian League, and the anti-Spartan Themistocles after 479 BC showed that even within Athens political opinion towards Persia was divided. Yet ideologically the Battle of Marathon and the victories at Salamis and Mycale boosted Greek morale beyond reality. In retrospect the war between Greece and Persia had become the symbol of the fight for freedom fought by small states against the might of an empire.

The Greek–Persian wars quickly acquired a mythical dimension. Aeschylus' play *The Persians*, performed in 472 BC, shows a Hellenized

version of the Persian court, the decadence of Persia, and the hubris of Xerxes, while an earlier play by Phrynichus, *The Fall of Miletus*, performed in 493 BC, was an embarrassing reminder for the Athenians of their half-hearted efforts to defend the freedom of the Greeks of Asia, and the author was fined 1000 drachmas. Herodotus' *Histories*, written around 430 BC, used the huge figures given for the Persian forces, in contrast to the small number of Greek forces, to demonstrate how successful a united Greece could be. Yet in his account Corinth, which fought against the Persians alongside the Greeks, was discredited, perhaps already in light of the political climate of the 430s BC in which Corinth emerged as an enemy of Athens. In antiquity itself the terms "Persians" and "Persian Wars" became powerful means of political propaganda. Augustus staged the Battle of Salamis in a specially excavated arena by the Tiber in 2 BC, the opposing sides being called "Athenians" and "Persians". In AD 39 Caligula's bridge across the bay of Naples was an imitation of the bridge which Xerxes had built over the Hellespont, used for a demonstration of military manoeuvres, during which the emperor paraded the son of the Parthian king Artabanus II (Josephus, *Antiquitates Judaicae*, 19. 5–6). Following Augustus, Nero also staged a sea battle in Rome, casting shadows on his intended war against Armenia in AD 57/58 (Dio, 61. 9. 6). In the later empire Lucius Verus in AD 161 and Caracalla in AD 214 took contingents of Spartan auxiliaries on their eastern campaign—symbolic gestures which were to reflect the Roman fight against the Persian/ Parthian power. In AD 235 Gordian III staged a festival for the goddess Athena Promachus for the Athenians at Marathon, again a symbolic gesture made prior to his eastern campaign. In modern times the fight between the Greeks and the Persians received an additional propagandistic note. It became symbolic of the fight of Western Europe against the Orient. Greece, seen as the birthplace of democracy, architecture, literature, and philosophy, and which had defended its values against the oriental despotism of the Persian king, now represented European and Western values upheld against the perceived threat of the Orient, which became equated with despotism, decadence, and effeminacy.

Persians

The Persians were an Iranian people, identified by their language as Indo-Europeans. Earliest written records identify three different regions of ancient Iran inhabited by Persians: Parsua, southwest of Lake Urmia; Parsumash, in the central Zagros mountains in northwestern Iran; and Parsa, in the southwest. Persian settlement in Parsa (Greek Persis, modern Fars) is first attested in the 7th century BC, and was the result of a migration process which had begun early in the 1st millennium BC, followed by a gradual process of acculturation, in which Persians lived alongside the indigenous Elamite population. It is this region that gave its name to the first Persian empire, which stretched from Egypt and the eastern Mediterranean to the Indus river, and which lasted from 559 BC to 331 BC.

In an exceptionally short but successful period of military expansion Cyrus II, who held the royal title of “king of Anshan”, an adaptation of the Elamite royal title, built the Persian empire, first conquering the Median empire of Astyages in 550 BC, followed by the conquests of Lydia in 547/46 BC and Babylonia in 539 BC. With Cyrus II’s annexation of the countries of eastern Iran and Central Asia, probably in the 530s, and the conquest of Egypt by his son Cambyses II (539–522 BC), the expansion of the Persian empire was concluded. Though Darius I (522–486 BC) undertook an expedition against the Scythians (518/17 BC) and maintained control over the Aegean (490 BC), his main concern was the consolidation of the empire, focusing on the administration of the provinces of the empire, the satrapies, established in the time of Cyrus II.

The Persians were organized in tribes, among them the Pasargadae, Maraphians, and Maspians. Prominent families of the Persian nobility formed the political elite under the Persian kings. As satraps, they represented the king in the lands of the empire, and were responsible for collecting tribute, levying military troops, and executing the

political will of the king. The term “Persians” was first used in the royal inscriptions of Darius I to identify an ethnic class of people, while the king identified himself and the royal family as Achaemenids, descendants of the eponymous founder of the empire, Achaemenes. Though Darius’ claim to an Achaemenid lineage might be pure creation in order to legitimize his kingship, the identification of the Persian dynasty as Achaemenids was recognized by Greek and Roman writers. Darius I defined the ethnic term “Persians” further to classify a Persian nobility, who also may have been identified by a common script and language, Old Persian, introduced by Darius I, and by the common worship of Ahura Mazda, the principal god of the Persian kings. The many peoples of the empire were permitted to maintain their distinctive character through their own language, culture, and religion, a latitude by which the Persians aimed to minimize the risk of revolt against their rule in the satrapies. The presence of the satrap, who represented the splendour of the king in the provinces, nevertheless influenced the local elite to adopt and imitate Achaemenid values, which were expressed in architecture as well as in luxury goods such as gold and silverware, jewellery, and Persian-style fabrics and fashion.

The Greeks used the term “Persians” as a general reference to the peoples of the Persian empire, regardless of their ethnic identity. Greek contact with the Persians began as early as the 6th century BC, when the Ionian Greeks under Cyrus II were part of the workforce which built Pasargadae, the first royal city of the Persians, and later Persepolis. In the same century the domestic chicken was introduced to mainland Greece; it was known as the Persian bird (Cratinus, 259; Aristophanes, *Birds*, 485, 707). Achaemenid gold and silver vessels served as models for the “Achaemenid *phialai* “ (libation bowls) in the late 6th and early 5th century BC, but Persian influence on Greece increased significantly after the Greek–Persian wars of 490 BC and 480/79 BC, when Greek awareness of the Persians and Persian culture was reflected in literature, art, and architecture. Persian luxury goods became a desired commodity among the Greek elite. Persian garments, imported as well as imitated, were luxury items for wealthy Greeks, and pottery reflecting Persian-shaped vessels was increasingly used. Athenian buildings like the Odeum were built after the Achaemenid model of a hypostyle hall. With the establishment of the Athenian empire in the mid-5th century BC, Athens regularly summoned its allies to Athens to celebrate the Great Panathenaea, during which the latter offered a cow and a panoply, while at Eleusis they were required to present first fruits during the Eleusinia. The procession of the allies can be seen as the Greek adaptation of the tribute or gifts being brought by peoples of the Persian empire, as

depicted on reliefs at Persepolis. Intriguingly, during the Panathenaea, the *kanephoroi* (“basket-carriers”) carried parasols, a distinctive attribute of the Persian king.

After the collapse of the Persian empire in 331 BC, first Alexander and then the Seleucids adopted many Persian practices, maintaining the satrapal division of the empire, Persian administration, collection of tribute, and the levying of military forces. Adopting Persian dress and royal court ceremony, Alexander even saw himself as the legitimate successor to the Achaemenid throne. In the Hellenistic period the close cultural contact in Asia Minor between the Greek/Lyodian community and the local Persians probably led to the Greek assimilation of the cult of Artemis with that of the Persian goddess Anahita, when inscriptions refer to the Greek goddess as “Artemis Anaitis” and “Artemis Persike”.

In the Roman period the term “Persians” acquired an extended meaning, generally referring to the people of both the Parthian and the Sassanian empires. European knowledge about the Persians was gradually all but forgotten, except for the names of kings and geographical places, preserved in the books of the Old Testament. Here Cyrus II was perceived as a benign ruler, who allowed the return of the Jewish exiles in Babylon, and who supported the rebuilding of the temple of Jerusalem. Early accounts of ancient Persian ruins were due to individuals travelling through Persia, though their identification was not always possible. Knowledge about the Persians began early in the 19th century with the decipherment of the cuneiform script by Georg Grotefend and Henry Rawlinson and the archaeological excavations of the Persian royal cities of Susa, Pasargadae, and Persepolis.

Phaestus

City in Crete

Phaestus is located in the Mesara plain in south central Crete. The Mesara is the largest fertile plain outside the Greek mainland and has always been a focus for cultivation and settlement. Its edges are defined to the north by the Ida range (Mount Psiloriti) and to the south by the Asterousia ranges, which block access to the southern coast; the plain runs into the Libyan Sea to the west at the bay of Mesara. Phaestus, along with Hagia Triada, is located on a ridge rising some 100 m above the plain and running east–west in the middle of it. Phaestus is set on the eastern summit of this ridge, with a commanding view of the plain below and to the east, while Hagia Triada is located at the west end, overlooking the Ieropotamos river where it runs into the sea.

Occupation of the Phaestus site is attested by deposits of pottery and by scraps of architecture from as early as the late Neolithic period (c.4000–3500 BC) and also in the Early Minoan period (c.3500–1150 BC). However, the principal architectural remains uncovered by the extensive excavations attest to the grandeur and importance of the site during the “palatial” period of Minoan civilization (c.2000–1450 BC). As at Mallia and Knossos, Phaestus went through two principal periods of use at this time, the protopalatial (c.2000–1700 BC) phase and the neopalatial (c.1700–1450 BC) phase, thus around 550 years during which a great deal of continuity of social structure and religious practice is evidenced at the site.

Although second in size to Knossos, Phaestus is the principal site in Crete for the study of the protopalatial period. At Knossos and Mallia, reconstruction work in the neopalatial phase obscures much of the earlier history of the building complexes, but careful excavation by the Italian team at Phaestus since 1900 has revealed much detail about the earlier period. Principal architectural features are a massive western facade of cut ashlar blocks, clearly forming the public face of the building, which fronts on to a west court that is built on three levels. The preservation of the protopalatial court and facade is due to the removal of the facade wall some 8 m to the east and the raising of the central part of the court by at least 1 m during the neopalatial rebuilding phase.

The west court is paved with flagstones and marked by characteristic “raised walkways”, present at the other palaces and

plausibly interpreted as defining processional routes. One branch of these walkways leads to the “theatral area”, a flight of low steps backed by a wall, interpreted as a place for people to stand or sit while watching or participating in events in the west court. A shrine has been identified in the immediate vicinity. A second branch leads to the protopalatial entrance to the palace, considerably simpler than its neopalatial successor and located further south. A third branch leads by a winding route to the lower west court, where the facade of the palace continues, behind which lie rooms interpreted as workshop and possibly domestic areas.

The principal effect of the neopalatial remodelling of the western area was to create a massive propylon leading off the west court, apparently to serve as a monumental entrance to the palace. This entrance may also have served to limit access to the palace, since exits from it were small. Beyond lie the storage areas and the central court. Both features were present, in slightly differing forms, in both protopalatial and neopalatial periods. The storage areas consist of rooms containing massive pithos storage jars, for storing grain, oil, or wine; caches of Linear A tablets and clay sealings found in this area, principally of the protopalatial phase, have revealed much of the workings of the bureaucracy of the palace. In particular, not only jars but also doors seem to have been sealed, and seals often bore the impression of multiple seals, perhaps an indication of hierarchy in the palace personnel.

The paved central court was colonnaded and furnished with a fine north entrance. The possible functions of the central courts of Minoan palaces remain obscure, with suggestions ranging from a simple place of gathering to the possibility of bull-leaping ceremonies (also given as suggestions for uses of the west court). The court is aligned with the remote Kamares cave in the mountains to the north, where excavation revealed characteristic sacred cave deposits, including examples of the old palace pottery style now called “Kamares” ware. North of the court is a series of rooms forming the characteristic “Minoan hall complex” of the neopalatial period, with two halls and anterooms, light wells, corridors, and a lustral basin. This area seems to form an equivalent to the “domestic quarter” at Knossos. Other sections of the palace have been identified with workshop, ceremonial, public, or private space.

Although the size of Phaestus is not great, it is spectacular by prehistoric standards, and not all of the area has been excavated. The palace buildings represent a flourishing and highly complex centre, whose relationship to its hinterland is still far from clear. The storage faculties seem impressive, but probably do not represent the whole output of the Mesara, so it seems likely that only partial concentration

of harvest at the centre was occurring. By the neopalatial period a number of lesser centres (“villas”) had sprung up in the countryside and seem similarly concerned with the organization of agricultural production. But in the protopalatial period, archaeology has revealed little infrastructure that can be associated with the palaces in the countryside. It seems likely that the symbolic and ideological aspects of the palaces were always primary and that the coming into being and flourishing of these places depended on the importance attached to such aspects by most, if not all, of the population. The difficult question of what portion of the population might have lived in a town around the palace has not been resolved for either phase.

Phaestus suffered, with much of Crete, at the end of the neopalatial period, as a result of either natural catastrophe or human intervention, or both. Some LMIII occupation is attested, and it is assumed that the site is signified by the Linear B *pa-i-to*, but in this last period of the Bronze Age the focus of occupation was the west end of the ridge, at the site of Hagia Triada. In the neopalatial period a large Minoan villa was constructed here, with characteristic features such as a “Minoan hall complex” and storage areas. Neopalatial finds from Hagia Triada are in many ways more impressive than those from Phaestus itself in this period, including a Linear A archive associated with storage areas, frescos, copper ingots, and objects regarded as high art. In the later Bronze Age a large building, interpreted by some as a Mycenaean megaron, was built at the site. This has been taken as an indication of Mycenaean control of the area at this time; it certainly points to new occupation in the area with a complex organization. The surrounding area includes a large number of houses and a large open space with a complex of storage places or perhaps of shops.

Evidence for post-Bronze Age occupation at Phaestus has come to light in various excavations on the ridge. At the palace site a temple, probably dedicated to Rhea, has been investigated at the southwest edge of the excavations. This was founded in the 8th century and used throughout the Classical and Hellenistic periods. Other geometric remains including houses were located west and southwest of the palace, and elsewhere on the ridge. Occupation certainly continued through the Archaic and Classical periods, although historical and archaeological evidence is rare. The Hellenistic period represents something of a revival. Phaestus was one of the city-states of Crete, and both the palace site and other sites on the ridge, including Hagia Triada, have revealed substantial remains of settlement. Apart from the temple of Rhea, there was also a temple to Apollo or Asclepius, a city wall, and paved roads. Phaestus remained independent, though subject to Gortyn, until the mid-2nd century BC, when it was sacked by Gortyn and not reoccupied.

Roman remains are few, but in Byzantine and Venetian times churches and a monastery were founded on the ridge, including the church of Hagios Georgios Galatas with 14th-century frescos, and tombs have been located in some excavations. The site of Hagia Triada was occupied by an Ottoman Turkish village until 1897.

Phidias

Athenian artist of the 5th century BC

Phidias, son of Charmides, was Athens' most prominent artist in the period between the start of the radical democracy and the beginning of the Peloponnesian War (c.462–431 BC). He was probably born around 490 BC. He was reputedly a pupil of Hegias and Hageladas of Argos (who also were supposed to be the teachers of Myron and Polyclitus), who introduced him to the new technique of bronze casting.

His earliest works can be dated only approximatively: they are a group of bronze statues in the sanctuary of Delphi, showing the victorious Athenian general Miltiades surrounded by gods and heroes (Pausanias, 10. 10. 1); an over-lifesize statue of *Athena Areia* (with a height of more than 3 m), whose clothes were of gold and flesh of marble, for a newly built temple at Plataea (Pausanias, 9. 4. 1; Plutarch, *Aristides*, 20; probably recognizable in the so-called Athena "Medici" type); and a giant bronze statue (about 9 m) of *Athena Promachos* ("front-fighter") on the Acropolis of Athens (Pausanias, 1. 28. 2). All these monuments were commissioned by the Athenian state as memorials of the victories at Marathon (490 BC), Plataea, and Salamis (480/79 BC); today it is widely believed that they were constructed around 460 BC, when because of its foreign policy situation (tensions with Sparta and Thebes) Athens was very much inclined to point to its leading role in the Persian Wars.

These works must already have won Phidias great fame by the middle of the 5th century BC; he apparently had connections with influential people in the city (above all Pericles) who decided what was to be built at Athens and by which artist. So when in 448 BC the city decided to rebuild the Parthenon with a huge statue of Athena Parthenos, Phidias was again commissioned to create this statue. More controversial is the question of how big a role Phidias really played in the building of the Parthenon itself and how many of its pediments, metopes, and friezes were really made by him: Plutarch (*Pericles*, 13) calls him "overseer" (*episkopos*) and credits him with a near-omnipotent role as leader and organizer; this, however, does not fit very well with our knowledge of democratic Athens, where many people had a surprisingly large say even in matters of art. On the other hand, the coherent conception of the building's exterior sculpture and its many connections with Athena Parthenos indicate that Phidias must have been at least a very influential supplier of ideas.

Phidias' fame rested chiefly on his *Athena Parthenos* and his

Olympian Zeus (see below). Both were made of gold and ivory laid over a wooden core and additionally decorated with other precious materials. The *Athena* was 12 m high and her garments consisted of more than a ton of gold (consuming a sizeable part of the state treasury of Athens); her extended right hand held a Nike (goddess of victory), her left a spear and a shield embellished on the outside with an Amazonomachy, on the inside with a Gigantomachy; furthermore, a snake (the symbol of the mythical Athenian king Erechtheus) was curled up inside the shield. Lapiths and Centaurs adorned Athena's sandals, and her pedestal displayed the birth of Pandora in relief. At the centre of her aegis a Gorgon was displayed, and the triple crest of her helmet sported a sphinx and two Pegasi, its cheek-pieces griffins. The statue was finished in 438 BC, the exterior sculpture of the Parthenon in 432 BC. During this time Phidias had several other, minor public commissions: the statue of *Athena Lemnia*, also on the Acropolis; the so-called *Mattei Amazon* for a contest in Ephesus; and a cult statue of *Aphrodite Ourania* ("the heavenly") for Elis near Olympia.

Plutarch (*Pericles*, 31f.) reports that Pericles' enemies prosecuted Phidias for allegedly embezzling ivory from *Athena Parthenos* and for blasphemy (because he allegedly included his and Pericles' portrait on the *Parthenos*' shield); but the evidence for this trial (about 434 BC) is very contradictory, and Phidias' death in prison is almost surely a later fiction, for his workshop at Olympia, which has been found (with tools, terracotta moulds, and even a cup bearing his name), must be dated to the 430s BC. The *Olympian Zeus* (Strabo, 8. 353f.; Pausanias, 5. 10. 2ff.) was even bigger than the *Parthenos*: enthroned, he held a Nike in his right hand and a sceptre in his left; the throne itself was richly embellished with Graces, Seasons, Nikai, Sphinxes, the slaughter of the children of the Theban queen Niobe, and an Amazonomachy; Phidias' brother or nephew Panaenus decorated the screens between the legs of the statue with paintings of *Hellas and Salamis*, some of the *Labours of Heracles*, *Hippodamia and Sterope*, and *Achilles and Penthesilea*. Another Amazonomachy could be seen on Zeus' footstool, and the statue's pedestal showed the birth of Aphrodite. At some point in the 420s BC Phidias disappears from our sources; according to some, he was killed by the people of Elis, but there is no real evidence for this.

Reliable sources for Phidias' life are few; brief mentions by Aristophanes (*Peace*, 605–18) and Plato (*Meno*, 91d; *Protagoras*, 311c) provide the only contemporary written testimony; more informative, but not always reliable, is Plutarch's *Life of Pericles* (late 1st century AD). In his *Olympic Discourse* of AD 97 Dio Chrysostom stages an imaginary defence of the *Olympian Zeus* by Phidias himself against

those who doubt that the majesty of a god can be rendered in human form; and in the 3rd century AD the Neoplatonist philosopher Plotinus pays an even more handsome tribute to this statue, which became one of the seven wonders of the world: he says (*Ennead*, 5. 8. 1) that Phidias did not make it from any earthly model, but that his imagination grasped what Zeus would look like if he wanted to make himself visible.

We do not really know what happened to Phidias' works in later antiquity. By the end of the 5th century AD most of them had probably already been destroyed; what at this time still survived of valuable artwork was in most cases transferred either to Rome or to Constantinople (the Neoplatonist Marinus (*Vita Procli*, 30) records that *Athena Parthenos* was taken out of the Parthenon during the lifetime of his teacher Proclus, but says nothing about the further fate of the statue). Probably the last mention of a work of Phidias may be found in the account of Niketas Choniates (c.1155–1217) that a statue of Athena (possibly the Promachos from the Acropolis) was destroyed by a raging mob who believed that her outstretched hand had lured foreign enemies into the city of Constantinople.

Biography

Born c.490 BC the son of Charmides, Phidias was the most famous artist of 5th-century Athens. He was said to have been a pupil of Hegias and Hageladas of Argos. His fame rested largely on his statues of Athena Promachos for the Parthenon and of Zeus for Olympia. The extent of his role as overseer of the Parthenon as a whole is uncertain. He died probably in the 420s BC.

Philip II 383/82–336^{BC}

King of Macedonia

The famous historian Theopompus said of Philip II that “Europe had never produced such a man at all as Philip, the son of Amyntas.” Yet the same sentence can also be translated “Europe had never endured such a man at all as Philip, the son of Amyntas.” The enigma reflects the mixed views of both Theopompus and other Greeks of the 4th century ^{BC}. Moreover, the conundrum persists today. Philip’s dubious reputation stems from the hostility shown towards him by many of the ancient writers who treated his life and deeds. His mortal enemy was the eloquent Demosthenes, whose portrait of him entirely in black has had the greatest impact on the historical imagination from antiquity to the present.

Philip was born in either 383 or 382 ^{BC} to Amyntas, king of Macedonia, and Eurydice, a princess of Lynceus. The northern connection proved vastly important to him, for the Illyrians in the northwest, the Paeonians in the north, and the Thracians in the northeast posed continual threats to Macedonia. The Greeks too exploited Macedonian weakness whenever possible. Philip spent three of his early years as a hostage in Thebes during the hegemony. There he learned much from Epaminondas and Pelopidas about Greek life. In 359 ^{BC} he returned home, and at the age of 24 ascended the throne.

At the outset Philip defeated the invading Paeonians and Illyrians, and coped with Athens, which supported the pretensions of Argaeus to the throne. This was the first of many Athenian acts of aggression against Philip. Success freed him for intervention in Thessaly at the request of the noble Aleuadae family. This friendly connection served him well by protecting his southern border and later allowing him direct entry into the mainstream of Greek affairs. Hence, by 358 ^{BC} Philip had confronted all his enemies by a combination of might and diplomacy.

Philip next built a new, mobile, formidable army, and in 357 ^{BC} he used it to conquer Amphipolis, which secured his eastern border and gave him command of the riverine commerce of the Strymon valley. Declaration of war by Athens failed to stop his move into the rich mining region of Mount Pangaeus. In 356 ^{BC} he seized Crenides, also rich in gold and silver the income from which provided him with more than 1,000 talents a year. Now freed from economic worries, in 356 ^{BC} he suppressed discontent among the Thracians, Paeonians, and Illyrians, and obstructed Athenian ambitions in the northern Aegean. With his conquest of Pydna, Potidaea, Anthimus, and Methone by 354 ^{BC} he gained control of the entire Macedonian coast. Victories in the north and peace in the south gave Philip a secure kingdom, which he

further consolidated by winning the complete allegiance of the nobility and moving Macedonians from their mountain fastnesses to newly established cities in the plain. Urban life thereby flourished, and many of these cities survive today in altered form.

Philip entered the main current of Greek affairs by invitation, not by design. In 355 BC Greece had become embroiled in the Sacred War, sparked when the Phocians illegally seized the sanctuary of Apollo at Delphi, whereupon they systematically plundered it. The members of the Amphictyonic Confederacy, which included Thessaly and Thebes, had vainly striven to dislodge the temple robbers. In 354 BC the Phocian general Onomarchus attempted to drive Thessaly from the war by supporting the rebellious tyrants of Pherae. The Thessalians appealed to Philip for help, and he proved so successful that Pherae entreated Onomarchus for relief. After hard fighting, Onomarchus drove Philip from Thessaly, but in the following year Philip defeated Onomarchus at the Battle of the Crocus Plain. Philip added a symbolic meaning to his victory, for he announced that he came to Greece as a champion of Apollo, whose sanctuary he intended to liberate. He came to Greece not as a foreign invader but as the pious defender of Greek religion.

Philip used his victory in Thessaly wisely by bringing it and its federal government completely over to his side. He systematically conquered the strategically vital harbour of Pagasae, next won Pherae, and reduced the rest of Thessaly to his will, the culmination of which was his election as archon of the Thessalian Confederacy. His new position in Thessaly permanently altered the face of Greek politics. He was now the most powerful man in Greece, and no single state could stand against him.

Alarmed by Philip's success in Thessaly, Athens strengthened its position in Thrace. In 352, BC it gained the Chersonese from Cersebleptes. After a campaign in the northwest that took him nearly to the Adriatic, Philip in 351 BC made sweeping gains in Thrace that threatened Athenian designs more closely. In the following spring Philip attacked Olynthus to remove the last major impediment in his political road. In 352 BC Olynthus had made peace with Athens, a breach of its earlier treaty with Philip. In 349 BC Philip declared war, whereupon Olynthus concluded an alliance with Athens. Yet an Athenian relief force proved too small to accomplish anything. Forgoing a direct attack on Olynthus, Philip instead reduced 32 surrounding allied cities, most of them scattered throughout the region. In 348 BC he conquered Torone and Micyberna, the port of Olynthus, thus closing the trap. Athenian help availed nothing, and in 346 BC Philip took and razed Olynthus. Athens had nonetheless openly declared war on Philip.

The years 347–346 BC proved fruitful for Philip. At the request of Thessaly and Thebes he marched into Phocis to end the Sacred War. His presence intimidated Athens into making peace. In 346 BC Philip and his allies and Athens with its naval allies concluded the Peace of Philocrates. All other states were excluded. While the negotiations were still pending, Philip defeated Cersebleptes, thus giving him control of the Chersonese. He now stood on the western side of the Hellespont, where he anchored the eastern flank of his empire both militarily and diplomatically.

After the peace Philip campaigned in the north from 344 to 340 BC, during which he subdued the Illyrians as far north as Albania, Epirus, and Thrace, where he established Philippopolis. These expeditions took Macedonian power north of the Great Balkan range. In the northeast he attacked Perinthus and Byzantium in 340 BC, but Athenian and Persian aid foiled his plans. In 339 BC Philip decided that Athens' time had come. Entering central Greece through the Dhema pass, he outflanked Thermopylae and reached Elatea, just three days' march from Attica. Demosthenes rallied first Athens and then Thebes to war. Throughout the year they parried Philip's thrusts, but in 338 BC he reached the small plain of Chaeronea unopposed. The ensuing battle was marked by hard fighting on both sides, but the Macedonians cut through the stubborn front of the Thebans and smashed the Athenians. Even though Philip had not vanquished all of Greece, he was nevertheless *hegemon* (commander) of it.

Military victory was crowned with political consolidation. In 337 BC Philip summoned the Greeks to a congress at Corinth. There he established the so-called League of Corinth that forged a general alliance of Greeks and Macedonians. Each member state received protection from external attack and freedom from outside interference in local affairs. Delegates of the cities met in common assembly to formulate policy, and Philip was elected *hegemon* to implement its resolutions in peace and lead it in war. One of his first acts was to summon the Greeks to a great crusade against Persia under his leadership. Contingents were assigned and muster ordered for the following spring.

His work in Corinth done, the lord of Greece returned to Macedonia to celebrate his seventh marriage and to prepare for the Persian expedition. His last wedding proved to be his last act. Philip entered the theatre at Aegae at the head of the wedding procession only to be struck down by an assassin. The party who instigated the deed was never discovered. All tracks had been too carefully covered. Alexander, soon to be called the Great, quickly and effortlessly ascended the throne. Philip was buried with great pomp, but his achievements did not die with him.

Philip's legacy reached from his day to this. He inspired the Macedonians to resist Rome, and even Roman victory did not erase his memory. As late as the 19th century his fame remained alive in Macedonian legends, and numerous myths perpetuated the memory of his famous kingdom. Folklore also attributed many of the ruins of antiquity to him. During the Greek War of Independence he served as an inspiration but in a mixed fashion. Although some Greeks compared him to various Turkish leaders, most saw him as a champion against the barbarians. Since World War II the communists and their successors have tried to establish a Slavic state of Macedonia, against which the Greeks have reasonably objected. In the midst of this controversy Philip returned to uphold the Greek cause. In 1978 Greek archaeologists discovered at Vergina a royal tomb that was almost certainly Philip's. Whosoever it was, it is purely Greek, dating from the late 4th century BC, incontestable proof of Philip's success in cultivating Hellenism in northern Greece. That heritage is as strong today as it was at his death.

Philip V 238–179_{BC}

King of Macedonia

The young prince Philip was left fatherless as a boy of 9 in 229 BC upon the death of his father Demetrius II. He was placed in the care of a regent, a royal relative named Antigonus Doson, and was sent to

Aratus of Sicyon, a Greek statesman and head of the Achaean League, in order to learn about Greek affairs. The effects of this education on Philip's later behaviour are impossible to calculate. He acceded to the throne in his own right in 221 BC, and quickly became embroiled in the Social War in which he and the Hellenic League faced the Aetolians, Sparta, and their allies. This war (217–200 BC) marked his transition into a mature king.

Philip was a brilliant military commander whose flair got him further than the odds against him should have allowed (although he experienced some spectacular setbacks), but he was reckless and foolhardy. The destruction of the kingdom of Macedonia and the eventual domination of northern Greece by Rome must in large measure be laid at Philip's door. He became alienated from Aratus (and his possible moderating influence) when he fell under the influence of Demetrius of Pharos, an Illyrian dynast whom Rome had placed in control of the Adriatic island of Pharos (Hvar in modern Croatia) and then displaced. Demetrius therefore harboured a deep-seated grievance against Rome, and incited Philip in the same direction. The final break came with Aratus' death in 213 BC, after Philip had seduced Aratus' daughter-in-law. Aratus died, claiming that Philip had poisoned him.

Philip irritated Rome by interfering in Illyria by land and sea, and by staging campaigns in Greece against Roman allies and on behalf of its enemies. Rome's declaration of war on Philip was probably inevitable. Three Macedonian wars against Rome and its allies ensued. Philip's military successes, continued meddling in the affairs of other Greek states, and alliances with various other Hellenistic monarchs increased Rome's suspicions of his political motives and led it to regard him as a dangerous threat. Paradoxically, the Romans claimed to be protectors of Greek freedom against Philip. The appointment of the great Roman general Flamininus to the command in the Second Macedonian War led to Philip's decisive defeat at the Battle of Cynoscephalae (in Thessaly) in 197 BC.

Philip was allowed to remain king, but a fine of 1,000 talents was levied on Macedonia, and his elder son Demetrius was taken to Rome as a hostage. Philip was confined to his kingdom and concentrated on rebuilding his country, with considerable success. He needed to be seen as an active ally of Rome in its further campaigns in Greece while in reality he bridled at its treatment. He continued to pursue an active foreign policy in Thrace, which only fuelled Rome's continued suspicions against him. After Demetrius had returned from Rome, his dubious actions and demeanour led his father to fear him as a Roman-inspired pretender to the throne. Perhaps encouraged by his younger son Perseus (who stood to benefit), Philip had Demetrius killed,

thereby clearing the way for the accession of Perseus to the Macedonian throne.

Philip set forth on a great tour of his kingdom, but fell seriously ill in Amphipolis in 179 BC and died soon after. Perseus inherited a kingdom that was far stronger than it had been at the beginning of Philip's reign. The irony of Philip's reconstruction of Macedonian manpower and its economy lies in the fact that Perseus thought that the country was strong enough to face Rome a third time – this time with fatal results.

It is not easy to assess Philip V's place in the Hellenic world. He is one of the last larger-than-life figures to emerge from the Hellenistic monarchies, but, his dynamic personality aside, this is due to the abundant ancient evidence about his life and career. Given his unique place in history between Greece and Rome, he was an object of fascination to Greek as well as to Roman historians. The flaws in Philip's character are clear and his military genius is undoubted, but hindsight shows that this dangerous combination ultimately opened northern Greece to Roman rule. The final assessment of F.W. Walbank still cannot be bettered:

But perhaps the greatest irony of all lies in this, that the king of Macedon, who was renowned above all for his energy, speed and enterprise, who opened his reign as the “darling of Greece” ... should claim his place in world history, not for any of these things which he initiated, but solely as the unwitting instrument that enabled the culture of Greece to spread along the paths of the legions to Rome, and so to the western civilisation that grew up after her. (Walbank, 1940, p. 275)

Biography

Born in 238 BC the son of Demetrius II, Philip was adopted (after his father's death in 229) by Antigonos Doson and sent to Aratus in Sicyon to be trained. He succeeded Antigonos as king of Macedonia in 221 BC. He was a brilliant commander and restored the fortunes of his kingdom, but he antagonized Rome. Fearing the treason of his elder son Demetrius, Philip had him killed. Philip died at Amphipolis in 179 BC.

Philo

Jewish philosopher of the 1st century AD

Philo, born in the latter half of the 1st century BC, belonged to a wealthy priestly family in the large Jewish community in Alexandria. Of the course of his life we know nothing save that in AD 39/40, as an old man, he was part of an embassy to Rome to plead the religious rights of the Jews with the emperor Caligula. He was the author of a large number of predominantly philosophical works, many of them taking the form of a commentary on passages from the Pentateuch in the Alexandrian Greek translation known as the Septuagint, in which he sought to reconcile God's revelation to Moses, in which he deeply believed, with the Platonic philosophy of his day (nowadays known as Middle Platonism). Because he believed in the inspired nature of the Septuagint translation, he had no need for recourse to the original Hebrew text, and there is no real evidence of his knowledge of the Hebrew language. His Hellenized Judaism was probably typical of many Greek-speaking Jews of his day, but stands at a distance from the contemporary emerging Rabbinic tradition, in which form Judaism was transmitted to the Middle Ages and beyond to the present day. There are consequently no explicit traces of Philonic influence on subsequent Jewish tradition, and no Jew mentions him by name until Azariah de Rossi in the 16th century. His writings were treasured and preserved by Christians, especially of the Alexandrian tradition.

As with the Stoics in their reconciliation between philosophy and the Homeric epics, Philo's method of reconciliation was allegorical exegesis. His Platonic reading of the divine revelation to Moses in the Pentateuch yields a metaphysical view of God and the cosmos, and of the place of the human within it, that is in many respects typical of the Middle Platonism of his day. His God is one and transcendent and consequently utterly beyond any human comprehension: Philo has a good claim to the title of "the father of negative theology". This one transcendent God is manifest in the universe through his "powers"

(*dynameis*), in which his kingly rule and beneficent providence are manifest. The highest of these powers (and sometimes apparently distinct from them) is the Word, or *Logos*, which has some of the characteristics of the Stoic *logos*, some of the Platonic *nous* (or intellect), but is uniquely regarded by Philo (responding to the language of the scriptures) as the utterance of God, as the one who speaks, pre-eminently to Moses. Here, and in other ways, we find in Philo a sense of God's personhood, lacking in his Middle Platonic contemporaries. In his understanding of creation, the account of Genesis is read in the light of Plato's *Timaeus*, and the cosmos, informed by the world-soul, is modelled on the soul-body unity of the human person. In his ethics Philo for the most part follows the Stoics.

Because so much of Philo's work survives, compared with contemporary Middle Platonists, he is an important witness to the philosophical matrix from which Neoplatonism developed, even though his own influence on the Neoplatonists themselves may not be very great. His Platonized Hebraism, however, paved the way for Christian Platonism; it is for his influence on Christian thinkers that he is important, beginning with Clement of Alexandria and Origen in Alexandria in the 2nd and 3rd centuries AD, and manifest in the 4th century in exegetes such as Didymus the Blind, also an Alexandrian, and the Cappadocian Fathers, especially Gregory of Nyssa. In his *Life of Moses* Philo provided a two-part interpretation of the biblical account of Moses' life: the first part tells the biblical story of Moses, and the second part, through an allegorical account of events from that life, provides an account of how the mind relates to God and the world. Gregory of Nyssa's own *Life of Moses* is clearly inspired by Philo's, and presents Moses' life in the second part as an allegory of the Christian life, understood as the ascent of the soul to God. Through Gregory's version, Philo's *Life of Moses* became one of the models for the *Lives* of the saints, perhaps the most popular form of literature in the Byzantine world. Philo's fundamentally contemplative ideal of the philosophical life had a profound influence on Christian monasticism (already with the Cappadocian Fathers, the "philosophical life" is a synonym for monasticism), and his work *On the Contemplative Life*, in which he gives an account of the life of a Jewish community called the *therapeutae* ("servants" or "worshippers" [of God]), was taken by Eusebius and many after him to be an account of an early Christian monastic community.

Philodemus c.110–40 BC

Philosopher and poet

Philodemus of Gadara studied philosophy in Athens, choosing Epicureanism from the several schools there as the doctrine he would follow for the rest of his life. After Athens, and perhaps after a stay in Alexandria, he lived in and around the bay of Naples, where Greeks had settled earlier but whose pleasant surroundings were attracting Romans; many of them were eager to be instructed in the ways of Epicureanism by Siro and Philodemus, both of whom made the acquaintance of Virgil and his circle of friends. Philodemus seems also to have attracted L. Calpurnius Piso Caesoninus, the father-in-law of Julius Caesar, as his patron. When Mount Vesuvius erupted in AD 79, covering Pompeii and nearby towns, the impressive villa on the shore of Herculaneum was found upon excavation in the 18th century to contain the charred papyrus remains of a library comprising, for the most part, Greek Epicurean texts, many by Philodemus. It is usually assumed that Piso was the villa's original owner. Since Philodemus refers in one of his works to his own house as “a humble cottage”, he would not have lived in the villa himself, as is sometimes thought.

In addition to the papyrus remains found at Herculaneum, we also have about 35 Greek epigrams written by Philodemus which were preserved in the manuscripts containing the *Greek Anthology*. Although

Epicurus discouraged his followers from writing poetry, Lucretius, Philodemus, and some others found ways to justify their poetic activities. What makes Philodemus particularly interesting is that among his prose treatises are several concerned with the composition of poetry and music, which prove to be among the most important theoretical writings on these subjects from Greek antiquity. In his *On Poems* Philodemus argues that poetry is to be judged not by its didactic or instructional value but rather by criteria that are largely but not entirely aesthetic. Poetry, that is, should play with ideas; but if one truly desires to be instructed in the ways of philosophy, there is no substitute for lectures and prose argument. Other writings by Philodemus on literary subjects are *On Music*, *On the Good King According to Homer*, and a *Rhetoric*. In these, as in most of his prose, Philodemus typically reviews and criticizes the various views proposed by others before offering his own views. This methodology is welcome in that it provides information otherwise unknown about obscure theorists of the Hellenistic period. Unfortunately, however, the fragmentary nature of the Herculaneum papyri is often such that isolated sentences, even if largely comprehensible in themselves, cannot be assigned to their proper authors.

Much of Philodemus' writing is ethical in nature. From one large work, *On Vices and Virtues*, and substantial fragments from several other books are extant: *On Flattery* (book 7), *On Household Management* (*Oeconomicus*, book 9), and *On Arrogance* (book 10). Other works preserved to varying degrees are *On Frankness*, *On Anger*, *On Death*, and an untitled ethical work now called, after its first editor, the *Comparetti Ethics*. Philodemus' writings thus nicely complement those of Lucretius, who concentrated almost exclusively in his Epicurean poem on the nature of matter and the causes of natural phenomena, with almost no attention paid to ethical concerns.

Only on the most important subject of death do Philodemus and Lucretius overlap to any appreciable extent, for Epicurus was convinced that only by learning to live without fear of death could mankind achieve and maintain the state of *ataraxia* (lack of disturbance) necessary for happiness. The Epicurean view, denying that there is any life after death or any reincarnation, or that the gods have any concern for our welfare (see Philodemus' *On the Gods*), was used to argue that we should be happy with what little is required to satisfy the basic needs of the body. Philodemus' personal and gentle treatment contrasts noticeably with Lucretius' harsh way of dealing with this subject.

Other ethical works by Philodemus are *On Piety*, *On Frankness*, and *On Anger*. Frankness, or freedom of speech, is not to be taken too literally: Philodemus is here concerned with the appropriate language

that one should use in various circumstances, which often calls for caution rather than complete truth. In *On Anger* Philodemus argues, against the Stoic position, that there are indeed times when a display of anger is appropriate.

Philodemus also wrote a work on scientific method, *On Signs*, and some histories of philosophy. It seems, however, that most, if not all, copies of his prose were destroyed in AD 79, although Diogenes Laertius (3rd century AD) may have organized his biographies of Greek philosophers (which end with a lengthy, favourable life of Epicurus) along the lines he found in Philodemus' history of philosophy. Philodemus' poetry, however, which had a much wider audience than his prose, survived on its own to influence contemporary Roman poets (Virgil, Catullus, Horace) and their immediate successors (Ovid, Tibullus, Propertius). Selected epigrams were incorporated by Philip of Thessalonica into his *Garland* of epigrams, which in turn found its way into the *Greek Anthology*, where Philodemus was read and admired from the Renaissance until the present day.

DAVID SIDER

Biography

Born at Gadara in Syria c.110 BC, Philodemus studied philosophy in Athens and became a follower of Epicureanism. Moving to Italy, he settled near Naples. Through L. Calpurnius Piso Caesoninus he was acquainted with many students of Greek literature including Horace and Virgil. Some 35 poems of his survive in the *Greek Anthology*. Some of his prose writings survive in charred papyri rescued from Piso's villa in Herculaneum. He died c.40 BC.

Philopoemen c.252–182 BC

Achaean statesman

Philopoemen, son of Craugis of Megalopolis in the Peloponnese, grew up against the background of the political activities of the Achaean League (a federation of Greek cities in the Peloponnese) under its most

famous leader Aratus of Sicyon. He became the pupil of Demophanes and Ecdelus, the liberators of Megalopolis from the tyrant who ruled the city in the mid-3rd century BC. Since Demophanes and Ecdelus had been pupils of the famous philosopher Arcesilaus of Pitane, head of the Academy in Athens, theories have been put forward about their philosophical influence upon the young Philopoemen. It can at least be said that they were staunch opponents of tyrannical government wherever they found it, and Philopoemen's predilection for federal government stayed with him throughout his life.

Philopoemen espoused the policies of the Achaean League, especially its strong anti-Spartan bias. He fought with the league against Sparta at the Battle of Sellasia in 221 BC, playing a prominent role that was lavishly praised by the historian Polybius (see below), and spent the next 11 years in Crete apparently furthering Macedonian interests there. His return to the Peloponnese coincided with the power vacuum in league politics left by the death of Aratus in 213 BC. He began holding league offices in 210 BC, and was elected its general for the first time in 208 BC.

Philopoemen finally helped to defeat the Spartan usurper Nabis, and forcibly united Sparta to the Achaean League in 192 BC, and he fought for its continued membership despite attempts to detach it by rival factions supported by Rome. His harsh treatment of Sparta alienated even some Achaean supporters and led to Spartan complaints in the Roman Senate. Philopoemen fell out of favour with Rome when he and his supporters maintained that various suggested solutions to Peloponnesian problems were none of Rome's concern but internal league affairs. He furthered his beliefs through league policies in the face of growing Roman involvement in the Peloponnese, although his intransigence caused a rift in the league. The political situation was unresolved when Philopoemen was captured in battle in Messenia in 183/82 BC and he died in prison, perhaps poisoned by his captors; poison was, of course, alleged by his political heirs.

Before his dramatic public funeral, Philopoemen's ashes were borne in an emotional procession back to Megalopolis by the young Polybius (later the historian), whose father Lycortas had been a friend and close political ally of Philopoemen (Lycortas succeeded Philopoemen as general of the league and continued to carry out his policies vigorously). In his later *Histories* Polybius, understandably profoundly affected by these earlier events, depicted Philopoemen as a great folk hero of the Achaean League and a great Greek patriot standing firm against the threat of Rome. Because the writings of Polybius are our best historical source for this period, his picture of Philopoemen has coloured later appreciation of him. Most modern scholarship would now argue that Philopoemen's vision was parochial and his policies

blinker by his opposition to Sparta and Rome. With the benefit of hindsight it is clear that the Achaean League could not in the end resist the power of Rome, and Philopoemen's activities led to greater Roman interference in Greek affairs and to the ultimate defeat of the Achaean League in 146 BC.

In his *Life of Philopoemen* Plutarch (1. 4) says that a certain Roman called Philopoemen "the last of the Greeks". Plutarch himself interprets this to mean that "Greece produced no great man after him, nor one worthy of her" (Loeb translation), but this is clearly a banal observation that is manifestly untrue. The explanation of this enigmatic statement has been widely debated by modern scholars. The most plausible interpretation is that Philopoemen was the last Greek in this turbulent age to achieve local political independence – albeit temporary – for his state. In this case it was the Greek Achaean League against the dominant power of Rome. Like Aratus before him, who had achieved similar freedoms, and because no later Greek was to have equal success in this regard, Philopoemen was thus worthy of extravagant praise and the accolade "the last of the Greeks" (see Errington, 1969, pp. 216–27).

E.E. RICE

Biography

Born c.252 BC the son of Craugis of Megalopolis, Philopoemen was a pupil of Demophanes and Ecdelus. He fought for the Achaean League against Sparta at the Battle of Sellasia (221 BC) and then served 11 years in Crete. Returning to the Peloponnese on the death of Aratus, he became general of the league in 208. In 192 he brought Sparta into the league but lost favour with Rome. Captured by Messenians, he died in prison in 182 BC.

Philosophy

Ancient Greeks were the first to practise philosophy – that is, they did not just provide world views or narratives, but arguments and reasons. Greeks were highly competitive and fond of adversarial, critical debate. To do this effectively, the philosophers abstracted and analysed, which led them to distinguish specialized areas of inquiry or method. They considered nothing exempt from scrutiny. Philosophy

was universal in scope, inclusive of politics, physics, astronomy, cosmology, mathematics, ethics, psychology, religion, and literature. On the whole, epistemology (how and what we know) was closely connected with metaphysics (what are the nature and causes of things), while ethics (literally habits and conduct) was an extension of psychology (theory about life).

The philosophers were small groups of dedicated individuals, usually conscious of their difference from ordinary citizens. The Pythagoreans first organized a philosophical society, which distinguished between occasional followers and more permanent members, and had its own rules of conduct. Plato established his Academy (387 BC) with the benefit of the Pythagorean example, and made it an autonomous fellowship for advanced universal study. In the Roman empire philosophy schools were centres of higher learning, passing this heritage to Europe and Islam. Thus, the Greek philosophical methods and practices became international and intrinsic to university education.

Greek philosophy is summarized here in the following periods: early philosophers (Presocratics, Sophists, and Socrates); Plato and Aristotle; the schools (Sceptics, Epicureans, Stoics, Lyceum, Academy); break, new trends, and state recognition (Middle Platonists, Aristotelians, Sceptics, Neopythagoreans, Plotinus); Neoplatonists and the end of the independent schools; Byzantines; and post-Byzantine and modern Greek philosophers.

Early Philosophers

The first philosophers (6th–5th century BC) abstracted for the purpose of understanding, provided varied accounts of their ideas, and tested their conclusions and common sense by taking them to logical extremes (e.g. paradox-making). They were disparate individuals or small circles of friends known by their home town or leader. Their generic labels, however, serve an ulterior bias. Aristotle called them “physicists”, because he wanted to show that they were limited to studying only one of his four causes, the material. Moderns call them “Presocratics”. Yet, all were interested in ethics, too, and several were Socrates’ contemporaries. Moreover, Socrates’ reputation as a philosopher is owed completely to Plato’s genius for philosophical writing and foresight in establishing a self-perpetuating school.

Greek philosophy until Plato is very fragmentary and doxographical. Some (e.g. Socrates, Pythagoras) preferred not to write, and the rest left records that did not survive intact. Our two main sources are Aristotle and the Neoplatonist Simplicius.

The Milesians (flourished 6th century BC) proposed parsimony. The world as one experiences it is due to one principle (*arche*) taking many

shapes and forms. For Thales this principle was multiphase water, for Anaximander infinitude, and for Anaximenes diffuse air. The Pythagoreans (6th–4th century BC) asserted that pure numbers are the permanent principles of physical things. They also arrived at the peculiar doctrine of the transmigration of psyche, not just from religious belief but from logical conclusion: the principle of life, psyche, cannot not-live.

Heraclitus (late 6th century), the “riddler”, alluded to the interrelatedness of things and their constant change by employing paradoxical (“everything is and is not”) or obscure (“everything flows”) sayings. Fire exemplifies the variety and contradictions of things. Philosophers, therefore, have to pay closer attention to reason and account (*logos*). On the other hand, the Eleatic Parmenides (early 5th century BC) made the startling claim that certainty in word, thought, or existence can only apply to something positive, unitary, and unchanging. Zeno followed this by showing the paradoxes entailed by change and plurality in ordinary events.

The Athenian Anaxagoras (5th century) responded to Parmenides with the theory that the world is a mixture of all substances, and change is just the rearrangement of stuffs. *Nous* (intellect), the stirrer of the mixture, alone is incomposite. Empedocles (influenced by Pythagoreans) was the first to invent the notion of fundamental cosmic constituents, the elements. He suggested four: Fire, Air, Water, and Earth. Democritus theorized that all things, including souls, are really temporary regroupings of an infinite number of tiny, invisible “indivisibles” (*atoma*). Thus what truly is and what appears are different.

Socrates (5th century BC) also upheld that there are invariable principles of things but sought them through the “right reason”. Ordinary conversations on ethics and knowledge are soon transformed into probing tests how to define things (virtue, etc.), so they are valid for all possible occasions. For his purpose Socrates employed extensively counter-argumentation. This was typically practised by the Sophists (lit. “the clever ones”), mainly for the purpose of winning lawsuits for their paying clients. Prominent sophists, however, such as Protagoras and Gorgias, were philosophically interested in the problems of communicable account (*logos*), ethics, and the origins of human judgement.

Plato and Aristotle

Plato and Aristotle (5th–4th century BC) consolidated earlier thought (Parmenides, Heraclitus, Anaxagoras, Empedocles, Socrates), and originated an unprecedented advance in conception and expression. They were responsible for a basic division in philosophy.

Plato was Socrates' most eloquent follower. What survives are his public treatises, the dialogues, which were written as Socratic debates on key philosophical problems. Plato was also influenced by the Pythagoreans, when he was involved with power-politics at a Greek colony in Sicily. The later Plato shifted his attention, but towards what: logic, politics, or Pythagorean-type metaphysics? Plato remains controversial, for every party wants to claim the first major philosopher as their own.

Aristotle was a student at the Academy for 20 years until Plato's death. After empirical studies on the natural world, he returned to Athens to start his own philosophy and school, the Lyceum, or Peripatos. Aristotle's philosophy bears some similarities with Plato's, but in other respects it contradicts it, and in the fundamentals it is different in scope. Unlike Plato, what survives are his internal school lectures (see below on the Lyceum and on Andronicus).

For Plato, truth is found in reality, which to be unfailingly valid has to be separate from the changeable world around us. Reasoning and mathematics point the way to full, precise knowledge (*episteme*) of the "true realities", the "Forms". One of these, the Good, is ultimate. Physical things, properties, and sensations are merely the "appearances" (*phainomena*) of the Forms.

For Aristotle, reality lies in nature. The "forms" are merely the essential definitions of things. Change can be philosophically known because it involves the "actualization" of the "potential" to gain the thing's proper definition (e.g. for an oak seed to become an oak tree). However, a thing may be logically stripped, abstracted, of its various physical and mathematical properties until the philosopher examines only its essential substance, and ultimately the pure being (*on*).

The elements of the physical world for Plato are minimal shape-quantities, since mathematical properties underlie physical qualities. But for Aristotle, they are minimal qualities (hot, dry, moist, cold), because the constituents of sense-perceived things must be sensations.

In logic, Plato developed the "dialectical" analysis, but Aristotle constructed the formal "syllogism" and critically distinguished the terms of scientific knowledge. In ethics, Plato boldly prescribed the ideal virtues of both individual and society, but Aristotle analytically described the problems of choice, constantly relying on the opinion of the moderate majority.

The Schools

The period from the 4th to the 1st century BC saw the establishment of philosophical schools at Athens, their proliferation, and greatest rivalry. Unfortunately, of their thousands of books, few survive complete, and scholars must rely on collections of fragments and

reports.

The first new talent was Pyrrho (360–270 BC). He pointed out that neither reason nor sense-perception can form knowledge, leaving the suspension of all judgements. Psychologically and ethically it offers “well-being” as relief from all theories. This “sceptical” approach did not survive as an independent school, but was adopted by the Academics.

Epicurus established the main branch of his school at Athens in 306 BC. He followed Democritus’ atomism, but went far further. Philosophy is practical wisdom gained empirically. Ethics shows that the natural impulse of living beings is to gain pleasure and avoid pain. Happiness is the autonomous pursuit and holding of enduring pleasure. This is found in philosophy, companionship, and modest delights. Knowledge is attained with the veridicality of sense perception, assisted by natural conceptions. Such is the “yardstick” (*kanon*) and “discerning mean” (*kriterion*) of truth.

The highly acclaimed Stoic school was founded in 300 BC by the Cypriot Zeno. He was succeeded by Cleanthes, and Chryssipus (head, 232–206 BC). They subdivided philosophy into logic, physics, and ethics, after the Old Academician Xenocrates. For Stoics, philosophy is practical, based on the world as it is. The natural world is analysed into one continuous body causally joined by a universal *pneuma* and organized by reason-principle (*logos*), which can be worshipped as divinity. Ethics shows how to lead a life according to nature, guided by reason. The “psychotherapeutic” benefit is “apathy”, freedom from troublesome passions, which brings the “well-being” of happiness. Physics and logic show how natural things are constituted, and become known through the presentation (*phantasia*) on the physical senses. Stoics developed sophisticated distinctions about substance, knowledge, and logic, and their terminology influenced subsequent philosophy.

Of the older schools, Aristotle’s Lyceum fell into decline. His successor Theophrastus continued the interest in natural science and philosophy. Yet, it seems that its philosophical naturalism and rationalism were better explored by Epicureanism and Stoicism, while science was better served at the new science school, the Museum of Alexandria. Strato rejected a good deal of Aristotle’s physics.

Plato’s Academy underwent the greatest transformation. His immediate successors (Speusippus, Xenocrates) elevated mathematics and considered the Forms as mathematical objects. But Arcesilaus (Middle Academy) abandoned systematic philosophy, and returned decidedly to the Socratic critical questioning, using it to attack Stoicism. With Carneades (New Academy), the Platonic school became the champion of scepticism, extending and formalizing it. Carneades’

refutation of Stoicism proved lasting.

Break, New Trends, and State Recognition

The first break happened in 86 BC, when the Roman consul Sulla sacked Athens. Institutions, including the Academy and the Lyceum, were destroyed. Philosophy diffused outside Athens and Greece, and freelancers advanced new trends. New schools often claimed succession from the original.

The Platonist Antiochus of Ascalon (1st century BC) reacted against the sceptical Academy. Instead he endorsed the positive value of Socratic thought, and showed that Aristotle and the Stoics developed particular views of Plato. Eventually this dealt the final blow to independent Stoicism: from now on there emerged Stoic Platonizers, such as Posidonius, the proponent of “universal sympathy”. Nevertheless, Stoicism flourished among Romans, from Seneca and Epictetus (1st century AD) to Emperor Marcus Aurelius (2nd century AD).

Plutarch of Chaeronea (AD 45–125), head of a Platonic school at Athens, promulgated the dualism of good and evil cosmic agents. He and the Neopythagorean Numenius proved the most influential of this period’s Platonizers; their doctrines entered Gnosticism, and similar Near Eastern religions. Moreover, in the 2nd-century *Handbook of Platonism* by one Alcinous, the Aristotelian forms were incorporated as the objects of sense perception. Alexandrian Platonists included the Jewish theologian Philo (who originated the Bible’s agreement with Plato), and the famous physician Galen. The 2nd- and 3rd-century AD Alexandrians St Clement and Origen pioneered Christian philosophy while arguing continuity with Platonism.

Around 60 BC Andronicus of Rhodes recovered Aristotle’s lectures, and edited them in the systematic form known to this day. He also started writing commentaries, amending and criticizing the doctrines as he saw fit. The Aristotelian Aristocles (2nd century AD) advocated Plato’s agreement with Aristotle, so long as the latter remained the fulfilment of the former. He taught Alexander of Aphrodisias.

Scepticism found a new exponent in Sextus Empiricus (c.AD 200). He showed that every philosophical position has equally strong but opposite arguments, which leads to the suspension of judgement (later employed in negative theology).

Hadrian and the Antonine Roman emperors inaugurated a series of state recognitions of Athenian learning. In AD 176 the emperor Marcus Aurelius established four Athenian professor-ships (“successors”) in Platonism, Aristotelianism, Stoicism, and Epicureanism. They were the highest-paid teachers in the empire, attracting 50 per cent more salary than the equivalent rhetoricians. However, the 3rd-century Roman

civil wars starved imperial funding. Of the independent successors only the Platonists endured.

The Platonic professor was probably Atticus. He maintained dualism, and was fiercely anti-Aristotelian. The Aristotelian professor of about AD 198/209 was Alexander of Aphrodisias. He was the great systematizer of Aristotelianism, and the proponent of influential interpretations. Particularly, he identified the object of thinking with the thinking activity and intellect. This strongly attracted Platonists, such as Plotinus, who made the Forms both objects and contents of intellect.

Individual Neopythagoreans especially flourished in the 2nd century AD. For them, the pure Plato was Pythagorean. Nicomachus, author of the *Introduction to Arithmetic* (later a textbook), held unity to be the ultimate principle of the Forms as numbers. Numenius of Apamea differentiated God the creator from God supreme, and asserted that matter is both active and evil. An allied Neopythagorean was possibly Ammonius Saccas, the Alexandrian teacher of Plotinus and the Christian Origen.

Plotinus (3rd century) settled in Rome, where he attracted a wide circle of followers, including senators. He saw reality as a continuum emanating from a transcendent One, made identical to Plato's Good. It becomes differentiated into Intellect and Soul, as degrees of being. Matter is informed by them but itself is a privation, the source of evil. For Plotinus, Plato was the philosopher who came closest to this truth. Plotinus entrusted his student Porphyry to edit and publicize his works. Porphyry had already left because he disliked Plotinus' diminishing of Aristotle.

Neoplatonists and the End of the Schools

After his departure from Plotinus (AD 268), Porphyry elevated Aristotelian studies and assimilated Stoic ethics and logic, all within a revised Platonism. Iamblichus (4th century) increased dramatically the popularity of this "harmonization", and added Neopythagorean ideas: mathematics is the reliable basis of knowledge, embracing theology. With this merger of most of Greek sectarian thinking (Epicureanism alone was rejected) into a new, unified Hellenic philosophy came the domination of higher education of the Mediterranean world.

Single schools of philosophy appeared at Apamea, Pergamum, and at the chief place of learning, Athens, where the new school called itself the "Academy" (Plutarch of Athens, Syria-nus, Proclus). From Athens, philosophy schools spread to Alexandria (Hierocles, Hermeias, Ammonius), and through Alexandria even to a Christian Platonic school at Gaza.

The philosophers of the 4th to 6th centuries AD bear the modern, inadequate label “Neoplatonists”. They rejected dualism, whether Gnostic, Christian, or Platonic/Pythagorean. They proposed that knowledge, reality, matter, religion, and ethics are multimodal, founded on One unqualified principle. Aristotelian logic and metaphysics are valid for the modes relating to sense perception, and to things referenced to or abstracted from body and senses. Platonism is valid for the modes fixed by intellect, for the incorporeal, permanent realities, and the One.

The Neoplatonic schools were centres for research and teaching. Accordingly, they offered an encyclopaedic education. It encompassed science (physics, mathematics, astronomy, medicine), the study of literature, interpretation (exegesis), and politics.

However, in AD 529 came the second break in the history of Greek philosophy. Emperor Justinian banned public teaching by pagans. This and the increased enforcement of state-regulated teaching ended the millennium of independent schools of philosophy.

The Athenian school closed, and after an unsuccessful trip to the Persian court, its scholars dispersed. However, Simplicius flourished after the ban as a private writer. Continuity in private would account for the story that the 7th-century Greek monk, Theodorus, who became archbishop of Canterbury, studied philosophy at Athens.

The Alexandrian school survived the ban by compromising with local authority. One of its later members, Stephanus, occupied the prestigious, sole philosophy professorship at the Imperial Academy of Constantinople (610).

Phoenicians

“Phoenicians” is a term used first in Classical sources to describe the people occupying the cities of the Levant coast between Syria and Israel. It was a term developed by the Greeks and its origins may be a Greek form of “Canaan” or, as is more usually assumed, it derived from the word for purple dye with which Phoenicians were associated. Linear B tablets contains a word *po-ni-ka* which probably referred to this dye.

The Phoenicians were inextricably linked to the sea; their cities were those independent Canaanite states which had not been absorbed by the Aramean or Israelite expansion. Among the Phoenician cities were Arvad, Beirut, Byblos, Sidon, Tyre, and Tarsus. The names of the coastal cities became synonymous with the Phoenicians; so in the *Odyssey* Eumaeus describes the Phoenician sailors who took him captive as Sidonian, from the city of Sidon (Homer, *Odyssey*, 4. 84). Phoenician also describes the descendants of colonial populations which the people of the Levant established elsewhere in the Mediterranean. Among their better-known colonies are Citium (in Cyprus: see Michaelidou-Nicolaou, 1987) and Carthage.

The Phoenicians are best known in ancient Greek literature for their commercial enterprise which paved the way for their foundation of new settlements, the majority of which were located in the western half of the Mediterranean (Frankenstein, 1979). The major colonization phase predated the emergence of Greek colonies; Thucydides (6. 2. 6) realized that Phoenician settlements in Sicily predated Greek activities on the island.

The Phoenicians transmitted much of their own culture and that of others from the Near East to Greece with the diffusion of their settlements and their highly developed trading activities. However, the Greek image of the Phoenicians has done much to limit the popular image of their culture: rich in religion, crafts-manship, and writing. It is easy to forget that the Greek figure Heracles is in fact a reincarnation of the Phoenician god Melaurt. The poor survival of

Phoenician writing makes it difficult to trace other influences. Few literary texts have survived, and the majority are brief religious dedications, honorific cult decrees, or funerary monuments inscribed on stone. The Phoenicians were also famous for their glassware (Pliny, *Naturalis Historia*, 36. 65) and their metal-work – they are said to have discovered the silver mines of Cadiz in southern Spain (Diodorus Siculus, 5. 20).

The spread of the Phoenicians westwards throughout the Mediterranean diffused an important orientalizing influence. The Phoenicians had absorbed many cultural aspects of the Assyrian and Mesopotamian civilizations, and so their influence on Greek civilization was not restricted to the transmission of their own culture. Communities on Cyprus display considerable absorption of Phoenician culture. The building styles, metalwork, and ivory objects indicate the degree of Phoenician presence; even the designs and decoration on indigenous pottery imitate Phoenician ware. Citium, in northeast Cyprus, and its inhabitants were described as Phoenician up to historical times; their most famous citizen was Zeno the Stoic philosopher.

Probably the most important legacy of the Phoenicians was the adoption of their alphabet by the ancient Greeks. The Greek alphabet developed out of the Semitic alphabet perhaps as late as the 8th or early 7th century BC. Herodotus had first suggested that the Greeks learnt their alphabet from the Phoenicians (Herodotus, 5. 58. 1–2). The word “alphabet” is derived from the first two letters of the Phoenician alphabet, *aleph* and *beta*.

The trading activities of the Phoenicians brought them into contact with the Greek world very early on. Many Greek communities may have had an element of Phoenician population; Herodotus describes how Euboea was originally settled by Phoenician travellers. Representations in Greek literature of Phoenician traders conjure up pictures of hostile pirates or pacific merchants. Their trading movements required sailing skill and well-constructed ships. The shipbuilding timber of the Levant coast was famous in antiquity. It is quite likely that the Phoenicians invented the bireme sometime in the 8th century BC: their warships were fitted with rams and must have influenced Greek shipbuilding technology. In the 6th to 4th centuries BC the Phoenicians supplied fleets to the Achaemenid kings whilst under Persian rule, and later to Alexander the Great when he overran the coastal cities in the 330s.

Phoenician presence within Greek communities expanded from the 5th century onwards. From the end of the 4th century the Phoenicians themselves were absorbing different aspects of Greek culture. This is best seen in the bilingual inscriptions of the Hellenistic period set up

to worship Phoenician deities.

More is known about the Phoenicians from their own colonies in the Mediterranean (e.g. Sicily, Sardinia, Malta, Spain, and North Africa) than is known from their native coastal cities (Bunnens, 1979). Some sites, apparently known in antiquity as Phoenician, suggest a different ethnicity from their inscriptions in Aramaic. It is almost certain that the Greek idea of “Phoenician” was very broad, and may have been applied to traders from the eastern Mediterranean seaboard rather than the identifiable Phoenician centres (Morris, 1992). Their cultural presence outlived any political strength in the Hellenistic and Roman periods.

Physics

Physics is one of the basic sciences in the development of human civilization. The semantic framework that defines modern physics was formulated through a series of procedures and modifications that are themselves studied by historians of science.

For many, the foundations of physics are based on the formulations proposed by certain ancient Greek philosophers concerning the interpretation of the world and the phenomena that evolve in it. These philosophers included Pythagoras, who attempted to pinpoint the physical principle of sight c.500 BC; Parmenides, who denied the reality of motion; and Anaxagoras, whose thoughts were directed in the opposite direction. Certain atomistic philosophers should also be mentioned, such as Leucippus, Epicurus, and Democritus. But it was Aristotle who formulated a system of physical philosophy that dominated Western civilization up to the 17th century, when the so-called “scientific revolution” took place and many Aristotelian views were rejected or reformulated, notably by Isaac Newton and his successors.

Aristotelian natural philosophy was the basis for further research about natural phenomena through observation. The main contribution of Aristotle was that he created a cohesive framework of principles and rules which govern the world, including both living creatures and non-living matter. For Aristotle there was no dispute about the reality and objectivity of the material world that is understood through human senses. He argued that there is no vacuum, a concept which he considered problematic to the way he tried to explain physical phenomena, and especially to the way he determined the movement of bodies. Aristotle made a distinction between natural motions and violent motions.

Another significant contribution of Aristotle was to transmit the hypothesis of Empedocles that the fundamental elements of all bodies are fire, air, water, and earth. These four elements were considered to be the only simple bodies for centuries, until modern chemistry proved that air was a mixture of several gases and water a compound of hydrogen and oxygen. This supposition was also compatible with the theory expressed by Aristotle that all bodies move in a way that brings them to their physical place. Lighter bodies move upwards, heavier ones downwards towards the centre of the earth. This was an example of natural motion, while the motion of a projectile was a violent one. Concerning the fall of heavy bodies Aristotle stated that they are attracted by means of their heaviness. The closer the bodies come to the earth's surface, the more the property increases. The impossibility of a vacuum, incidentally, led Aristotle to formulate a principle analogous to that of inertia.

During the Hellenistic period physics retreated as a discipline of science and other, more descriptive fields, such as geography and natural history, became more popular. Meanwhile, the influence of the Neoplatonic school was maintained. At Alexandria several scholars, such as Ammonius and his student Philoponus, tried to link ancient Greek natural philosophy with the Christian faith.

Pindar c.518–c.438_{BC}

Lyric poet

Pindar is best known today for his four books of epinician (victory) odes which were written on commission to celebrate victories at the great games of ancient Greece. By a mixture of direct praise and the interweaving of heroic legends, they glorify the aristocratic life, whose pinnacle is victory at the games and recognition for it.

In the 2nd century_{BC} Pindar's work was divided into 17 books, roughly according to genre. Of these the four books of epinician odes survive virtually complete. Fragments of poems in other genres survive: hymns, paeans, dithyrambs (two books), processional hymns (two books), maiden songs (three books), choral songs (two books), praise songs, and dirges. These poems, where the evidence allows of an opinion, were, like the epinicians, written on commission. In the circumstances, it is difficult to disentangle the poet's own sentiments and autobiographical material from the restrictions and demands imposed by the conventions of the medium. Many of the opinions and value judgements expressed are revealed, on comparing the epinician odes of Bacchylides, as part of the baggage carried by a writer in this genre: it celebrates victory through toil, but victory and toil appropriate to aristocrats who have the time to exhaust themselves in the non-productive pursuit of kudos. Nevertheless, it is possible, by judicious examination of internal allusions and external sources (e.g. victors' lists), to get some idea of the progress of Pindar's career, at least as a writer of epinicia.

The epinician odes are divided into *Olympians* (14), *Pythians* (12), *Nemeans* (11), and *Isthmians* (8 as well as fragments). Not all celebrate

victories in these games: *Nemean* 4 and 9 record victories at the Adrasteia in Sicyon; *Nemean* 10 a victory at the Argive Heraia; *Pythians* 2 and 3 are epistles to Hieron of Syracuse; *Isthmian* 2 an epistle to Xenocrates of Acragas, and *Nemean* 11 celebrates the appointment of Aristagoras of Tenedos to a magistracy. Almost all of the latter, however, make some allusion to the games, and follow the same overall pattern as a typical epinician.

This pattern – very roughly speaking – is, at some point in the poem, to give the details of the victory or set its scene briefly and, as soon as possible, to present one or a series of stories associated with the legendary traditions of the homeland of the victor and/or patron. The linking passages are often tenuous. Consider for example the very earliest epinician (*Pythian* 10, for a Thessalian winner in the boys' double foot race), where Pindar compares his technique to that of a bee, which flits from one theme to another (lines 53–54). Early as the ode is, it already fixes the mould in which most were cast: the victor and his family are introduced and praised, especially his father, whose good fortune extends as far as a mortal's can; but even farther are the Hyperboreans, with whom Perseus once feasted; there follow praise of the Hyperboreans and a brief allusion to the slaying of the Gorgon, whose severed head turned men to stone; no miracle is beyond belief; the finest victory hymn flits like a bee from one theme to another; the poet hopes that his poem will glorify the victor in the eyes of others, and praises the ruler of Thessaly (who seems to have commissioned the poem from him).

The victors range from the very rich who entered victorious chariots to boxers and wrestlers. There is even one *aulos* player (*Pythian* 12 for Midas of Acragas). But all are encompassed within the aristocratic ideal of nobility and noble deeds. Pindar's most distinguished patrons were the Sicilian tyrants Hieron and Theron and members of their entourages. It is clear that the poet spent several months at least in Sicily, during the Olympic year 476 BC. He wrote three odes (*Pythians* 9 in 474 BC, 4 and 5 in 462 BC) for Arcesilas of Cyrene, in which he alludes to his own family connection with the Spartan clan of Aegeidae. But those for whom he wrote the largest number of victory odes (11) were victors from Aegina: he may have spent the years immediately before and after the Persian invasion of 480–479 BC on this island (*Isthmian* 5 of 480 BC refers to the battle of Salamis, and *Isthmian* 8 of 478 BC to the removal of the danger threatening Hellas). At *Nemean* 7. 61 he calls himself a *xenos* (guest) of the Aeginetans. It is to be remembered that not all Thebans supported the dominant faction of Medizers: 400 fought with Leonidas at Thermopylae (Herodotus, 7. 202), and after the Battle of Plataea the victorious Hellenes punished only the leading Medizers at Thebes. If it is true

that Pindar was later criticized at Thebes for writing in praise of Athens, this must also be seen in the same context of divided loyalties.

Pindar's epinician career began when he was 20 in 498 BC, with a commission from Thessaly (*Pythian* 10). In the year of Marathon he had his first commission from Sicily (*Pythians* 6 and 12 for Acragas). During the 480s and early 470s BC he wrote for Boeotian Orchomenus (*Olympian* 14), Athens (*Pythian* 7 for an Alcmaeonid), Attic Acharnae (*Nemean* 2), and Aegina (*Nemean* 5, *Isthmians* 5, 6, 8). The decade or so following the Persian invasions marks the high point of his popularity and production in this genre: three odes for Thebans (*Isthmians* 1, 3, 4), three for Aeginetans (*Isthmian* 8, *Nemeans* 3, 4), one for Cyrene (*Pythian* 9), and an impressive thirteen for Sicily and southern Italy (*Olympians* 1, 2, 3, 6, 10, 11, 12, *Pythians* 1, 2, 3, *Nemeans* 1, 9, *Isthmian* 2). There are signs, however, that towards the end of this period Pindar found it harder to get patrons (*Isthmian* 2 of c.470 BC is a letter to Xenocrates of Acragas which seems to be a request for payment). For the rest of his epinician career, he cast his net more widely: there were still Aegina (*Olympian* 8, *Nemeans* 6, 7, 8), although that island's conquest by Athens almost completely cut off this source (only *Pythian* 8 of 446 BC comes from after the conquest), and Thebes (*Pythian* 11, *Isthmian* 7), but also, on the mainland Opous (*Olympian* 9), Corinth (*Olympian* 3), and Argos (*Nemean* 10), and overseas Rhodes (*Olympian* 7), Cyrene (*Pythians* 4 and 5), Tenedos (*Nemean* 11), and Camarina (*Olympians* 4 and 5).

Pindar's poems were probably meant to be sung, and many to be accompanied by dancing. The music and choreography have been lost, and only the words remain. His poetry, regardless of the genre, is characterized by a controlled extravagance of language, and a skill and agility in linking apparently disconnected themes into a satisfying whole, which is unmatched by any other poet (one has only to compare the epinician odes of Pindar and Bacchylides to see how pedestrian the latter appear by contrast).

The epinician genre more or less died with Pindar, or rather with the drying-up of the supply of patrons. The tyrannical regimes of Sicily and Cyrene had been replaced by more broadly based governments, and in general rich individuals had other claims upon their resources, particularly in the unsettled conditions that prevailed throughout the second half of the 5th century BC. The result is that Pindar's poetry, when it was used as a model by later poets, was mined only for its extravagance of imagery and apparent convolution of expression. The poets of the Pléiade, for example, wrote so-called Pindaric poetry, which fails because it completely misses not only the music and dance, which were integral features of the original, but also the occasion to which the epinician genre is bound.

It was Aristophanes of Byzantium who divided the text of Pindar into 17 books; Aristarchus (2nd century BC) subsequently worked on the text, and Didymus (1st century BC) produced extensive commentaries. By the 3rd century AD only the epinicia were still circulating widely, perhaps, as Eustathios later claimed, because they had more of human interest and less of mythology than the other genres, and were also less obscure (Drachmann, 1926, Praefatio, 34). They were thus more suitable to be used as school texts. Later, in Byzantium, Pindar was studied more for his language than for his qualities as a poet. Eustathios (d. 1194) heralds a revival of scholarly interest, to be followed by editions made by Thomas Magister, Moschopoulos (both 13th–14th centuries), and Triclinius (14th century).

Biography

Born c.518 BC at Cynoscephalae in Boeotia, Pindar wrote lyric poetry in several genres, divided later into 17 books. Of these, four books of epinician (victory) odes survive. These were written on commission to celebrate victories at the great games. By mixing direct praise with references to heroic legend, they glorify the aristocratic life, of which victory at the games was the pinnacle. Pindar died c.438 BC.

Pindus

Mountain range in northern Greece

The Pindus mountain range stretches like a backbone through northern Greece in a position roughly analogous to the Pennine chain in England, with the difference that the Pindus is far higher and more impenetrable. Its highest peak, Smolikas, is over 2600 m above sea

level, and the central Zygos or Katara pass is over 1700 m. There is now one other road over the Pindus through Konitsa, and a tunnel is being built to get over the difficulty that the Zygos pass is often closed by snow. In ancient times great generals such as Alexander the Great and Caesar won praise for their daring and leadership in crossing the Pindus, and up until modern times travellers crossing the mountains found it a hazardous experience.

The Pindus is not one range, but a series of limestone and greenstone ranges with high plateaux in between. These plateaux provide excellent summer pasturage, but are obviously difficult of access. Hence transhumance has been practised in the Pindus from ancient times until the present day with shepherds driving their flocks into the mountains each spring, returning them to the plains of Epirus and Thessaly in the winter. Such transhumance has been particularly associated with the Vlachs. There is no certain evidence linking the Vlachs with the Pindus until the 14th century, although it is known that there were Vlachs in Thessaly and Vlachs practising transhumance before this date. The Pindus is the place where the largest concentration of Vlachs in the Balkans can be found, but there are also Greek villages in the area.

In Classical times there are references to tribes such as the Tymphaei living in the Pindus, but little is known about them. Strabo, perhaps going back to Hecateus, is well informed about the rivers which rise in the mountains (the Haliacmon, Peneus, Aous, Aspropotamus, and Arachthus) but is vague about the people of this area. In the Roman era there was no road across the Pindus, the roads in Epirus and Thessaly going from north to south rather than east to west. Strabo mentions towns at Tricca (modern Trikkala), Aeginium, Aethicia, and Chalcis (possibly modern Chaliki), all on the Thessalian side of the Zygos pass. The western side would appear to have suffered from the brutal Roman punishment of the Molossian defection in 168

BC.

Piracy

Ancient sources show that piracy has always coexisted with sea voyages and maritime trade. In the age that Homer described in the *Odyssey*, piracy was a profession that men entered as a recognized way

of making a living. It was so widespread, and the consequences to its victims so disastrous, that settlements often moved away from coastal areas (where they were a target for raids) to locations further inland and were surrounded by protective walls (Thucydides, 1. 7).

War and piracy have always had much in common. The acquisition of booty was a vital element in ancient Greek warfare and in ancient sources it is frequently very difficult to distinguish between warfare and piracy. At the end of the Archaic period, however, with the development of organized states with mercenary armies, a distinction emerges. In the 5th century ^{BC} opportunities for plunder provided the impetus for several military offensives. During the Peloponnesian War each side plundered the other's territory by both land and sea. Several generals even used the methods of pirates to help finance their wars. These practices continued in the Hellenistic period. For example, Philip II of Macedon used the proceeds of piracy to finance the building of his navy. Another incentive to piracy lay in the custom of reprisals against an enemy.

As means of accumulating wealth, trade and piracy have much in common. Piracy posed a considerable threat to merchants: the pirates of Zancle were ideally placed to attack and seize ships passing through the straits of Messina between Italy and Sicily. The Taurian tribes in the Crimea and the Thracians developed an organized system of wrecking ships for plunder (Diodorus, 20. 25; Xenophon, *Anabasis*, 7. 5. 12). This system became so widespread in Roman times that the Romans were obliged to impose penalties on wreckers. Illyrian pirates were another source of trouble. According to Polybius (2. 5), the Illyrians had always been in the habit of pillaging along the extensive Roman seaboard; as the principal cities were located in the interior, help against such raids was distant and slow to arrive, allowing the Illyrians to overrun and plunder the surrounding territory unmolested.

Piracy and the slave trade were also closely connected. The largest centres for both activities were Crete and Cilicia, and pirates would often sell their captives into slavery. This was not always the case. Strabo, writing about the northeastern Black Sea coast, says of the local population that they lived by robbery at sea. Their boats were slender, narrow, and light, holding only about 25 people, rarely as many as 30. The Greeks called them *kamarai* (11. 2. 12). Their cruellest practice was to wander on foot night and day looking for people to kidnap but "they readily offer to release their captives for ransom, informing their relatives after they have put out to sea" (Strabo, 11. 2. 12). In this part of the Pontus pirates would attack Greek cities.

The control of piracy is usually considered to have been one of the prime functions of the Roman garrisons established along the eastern

coast of the Black Sea under the principate. In the middle of the 3rd century AD large bands of marauders from the Pontus would make their way into the Aegean, plundering both shores, penetrating as far south as the coast of Lycia and Pamphylia, and forcing their way inland as far as Cappadocia (Zosimus, 1. 28; Ammian Marcellinus, 31. 5.15).

The authorities of Greece and of countries on the Black Sea tried to fight piracy to make the sea safe for voyagers and merchants. The king of the Bosporan kingdom, Eumelus (310/09–304/03 BC) “in order to protect those sailing through Pontus Euxinus ... waged war against the Heniochi, Tauri, and Achaei who were engaging in piracy and cleansed the sea of such pirates, for which he was praised not only in his own kingdom, but also throughout the universe, for traders everywhere spread the word about his determination” (Diodorus, 20. 25).

Piracy in the Black Sea was a matter of concern to the rulers of non-Pontic countries as well. Even Pericles was aware of these dangers, and it is possible that one of the reasons for his Pontic expedition was to protect Athenian interests and trade in the Black Sea from local pirates (Plutarch, *Pericles*, 50; Diodorus, 20. 25). An inscription (228–225 BC) from a temple wall in Samothrace gives us some details of Egyptian methods there: the *strategos* (commander) of the Hellespont and Thrace is thanked for the precautions taken to safeguard the island against marauders who regularly threatened to seize the temple treasures: a detachment of horse, foot, and catapult men had been dispatched to the island (*Sylloge Inscriptionum Graecarum*, 3. 502).

In the Archaic and Classical periods the aim of pirates had been to satisfy their own needs through plunder. Rulers had resisted this. In the Hellenistic period there was a gradual change in the nature of piracy: it became more concerned with supplying the demand for slaves throughout the Greek world. Rulers began to come to an accommodation with pirates and the slave trade became one of the sources of revenue for their states. From the 3rd/2nd centuries BC local rulers were no longer concerned about piracy. On the contrary: in the Pontus, for example, they colluded with them. As Strabo reports: “[Achaei, Zygi, and Heniochi] sailing sometimes against merchant vessels and sometimes against a country or even a city ... hold the mastery of the sea. And they are sometimes assisted even by those who hold the Bosphorus, the latter supplying them with mooring places, with a marketplace, and with means of disposing of their booty” (11. 2. 12). At this time Tanais became a large and famous marketplace in the Bosphorus, where slaves, hides, and other goods of the sort possessed by nomads were brought for exchange for clothing, wine, and other trappings of civilized life (Strabo, 11. 2. 3).

Piraeus

The Piraeus (in Greek: Peiraieus) is a rocky limestone peninsula situated at the northeastern end of the Saronic Gulf about 10 km southwest of the centre of Athens. Its chief features are the hill of Munychia (modern Kastella or Kastellon), which rises abruptly in the northeast, and Akte, a lower plateau that extends southwest towards the sea. According to Strabo (*Geography*, 1. 3. 18) Piraeus derives from *peran* meaning "opposite" because the peninsula was originally detached from the mainland. It possesses three harbours: from east to west these are Zea (modern Limen Zeas or Pasolimi), Munychia (modern Tour-kolimani or latterly Mikrolimani), and Cantharus or Goblet (modern Kentrikos Limen). Cantharus was also known as Megas Limen or Great Harbour in antiquity. There is little archaeological evidence for any settlement that predates the 5th century BC. The region entered history in 510 BC when Munychia was fortified by the tyrant Hippias, who intended to make it the seat of his government after being driven out of Athens ([Aristotle], *Constitution of Athens*, 19. 2).

The Piraeus became important in 483 BC when, on the initiative of the politician Themistocles, the Athenians voted to allocate the proceeds from a new strike at the silver mines of Laurium to finance the building of a fleet. At the same time work began on a fortification wall to safeguard the Piraeus against attack. Previously the sandy bay of Phalerum, which lies to the east and which is "the place where sea and city are nearest" (Pausanias 1. 2. 2), had served as a roadstead for the Athenian navy, though it afforded little shelter. Thanks to Themistocles' initiative the Athenian fleet was able to play a decisive part in the defeat of the Persians in the straits of Salamis in 480 BC.

Without the development of the Piraeus, Athens would never have acquired its maritime empire. Naval inventories reveal that in the 4th century BC Zea was the largest naval port with no fewer than 196 shipsheds, while the Great Harbour accommodated 94, and Munychia 82. The naval headquarters are likely to have been concentrated in the Great Harbour.

The fortification of the Piraeus was also destined to have profound consequences for its political development since it was the *thetes*, the lowest property-holding group, who served as rowers and who, when Athens became dependent on its sea power, came to acquire a leading position in foreign-policy decisions. From this evolved the intimate association between democracy and the Piraeus, whose population, in Aristotle's phrase, was "more democratic" than that of Athens (*Politics*, 5. 1303b10–12). As an administrative unit the deme of Piraeus was "a law unto itself" (Whitehead 1986, p.122). One of the clearest indications of its anomalous nature is the fact that its demarch was appointed by lot by the entire citizen body of Athens, whereas all other demarchs were appointed by their demes.

In 458/57 BC the city of Athens became linked to the Piraeus by the construction of two diverging long walls that incorporated the Piraeus and Phalerum. This wedge-shaped area could now be sealed off from the rest of Attica in time of war. Shortly afterwards a middle wall, known as the southern Long Wall, was built parallel to the western one, thereby eliminating the bay of Phalerum. Around the middle of the 5th century BC, and probably at Pericles' suggestion, the town planner Hippodamus of Miletus was invited to "cut up the Piraeus" (Aristotle, *Politics*, 2. 1267b23), which he did according to a grid pattern.

The Piraeus now began to develop as an urban entity that came to rival Athens in size. It also became the leading commercial port in the eastern Mediterranean. Since Athens was now very largely dependent on imported corn, the commercial quarter, which was known as the Emporion, was vital to its survival. The Emporion was situated along the eastern and northern shorelines of the Great Harbour. In 431 BC Pericles could boast with justification that "all the produce of every land comes to Athens" (Thucydides, 2. 38). A duty of 2 per cent was levied on all cargoes passing through the Emporion. We receive some indication of the volume of goods that it handled from the fact that in 399 BC, when trade can have barely recovered from the crippling effects of the Peloponnesian War, the state collected 1,800 talents in harbour dues.

The Piraeus was home for a very large number of metics who came from all over the Greek world and beyond. Their presence, which is evident from a variety of foreign cults established around the port,

must have lent it a very cosmopolitan flavour. Among the most prominent of these cults was that of the Thracian goddess Bendis, situated on Munychia (Plato, *Republic*, 1. 327a). Others include the Egyptian gods Isis and Sarapis, and the Phoenician Baal. It was here, too, that the cult of the healing god Asclepius was first introduced into Attica around 420 BC. According to Pausanias the most notable sight in the Piraeus was the Diisoterion or shrine of Zeus Soter and Athena Soteira (1. 1. 3).

Like any thriving port, the Piraeus possessed its sleazy underworld. Aristophanes' description of the spectacle of a man defecating in a brothel, as observed by Trygaeus as he flies over the Piraeus, was evidently intended to convey the distinctive flavour of the region (*Peace*, 164f.). Though many prosperous Athenians and metics lived in the Piraeus, given the size of its population, it is plausible to suppose that it also contained a large number of multiple dwellings or *synoikiai*, the ancient Greek equivalent of the modern tenement.

The Piraeus was critical to Athenian strategy during the Peloponnesian War when, on Pericles' advice, the decision was taken to abandon the countryside of Attica, turn Athens into an island, and coop up the entire population within the fortified area of Athens, the Long Walls, and the Piraeus. This led to a very severe outbreak of the plague, which reduced Athens' population by perhaps as much as one-third. The peace terms to which Athens agreed at the end of the war required the destruction of the Long Walls and the Piraeus circuit (404 BC). The Piraeus subsequently played a leading part in resistance to the Spartan-backed Thirty Tyrants when exiles under the command of Thrasybulus seized Munychia and drove out the Thirty.

The circuit walls and shipsheds were rebuilt by the Athenian general Conon in 393 BC. Before long the Piraeus resumed its importance as a naval and commercial port of first-rank significance. In the middle of the 5th century BC it was able to accommodate more than 350 triremes. In 330 BC Philon's so-called Arsenal was built in Zea, described by Pliny (*Historia Naturalis*, 7. 37. 135) as one of the most admired buildings of antiquity. This was not an arsenal as such but a warehouse for the storage of the sails, oars, and tackle that were removed from triremes when they were at berth. No traces of the building remain and it can be reconstructed only from the precise specifications that are preserved in an inscription authorizing the work to be undertaken. Ironically, within a decade of its completion, Athens had suffered a defeat at the hands of the Macedonians that eclipsed its naval power forever.

Under Macedonian domination (322–229 BC) the garrison on Munychia Hill became one of the four “fetters of Greece”. The Piraeus now began to decline steadily in size and importance. In the 2nd

century BC it served as a Roman base for naval operations against the Macedonians. Lacking the glamour that attached to the name of Athens, the Piraeus never attracted royal patronage in the Hellenistic era. The only evidence of building activity is the impressive and well-preserved theatre overlooking Zea Port, which was constructed around the middle of the 2nd century BC. In around 120 BC several major festivals were revived and celebrated on a grandiose scale, notably the Diisoteria and Munychia, whose festivities incorporated nautical manoeuvres performed by ephebes.

In 86 BC the Piraeus was ruthlessly destroyed by the Roman general Sulla who spared “neither Philon’s Arsenal nor the docks nor any of its other famous architectural works” (Appian, *Mithridatic Wars*, 41). One of the few buildings to escape destruction was the Diisoterion, though all traces of the shrine have since disappeared. A number of important bronze statues, including those of *Apollo*, *Artemis*, and *Athena*, which were deliberately buried at this time, came to light in 1959. Though it continued to function as a port, notably for the flourishing trade in neo-Attic sculpture that the Roman market demanded, the Piraeus never recovered its importance in antiquity. When Pausanias visited it in the 2nd century AD, very few buildings of note were standing.

The only traces of the ancient city that are visible today include portions of the 4th-century BC circuit wall, the theatre at Zea, some shipsheds, and the restored tomb of Themistocles on the promontory of Alkimos. Virtually all that remains of the Hippodamian layout is confined to a series of boundary markers, though the modern street plan follows the course of its ancient predecessor.

Pisistratus

Tyrant of Athens in the 6th century BC

Solon’s reforms had (perhaps inevitably) left none of the contending parties completely satisfied. He himself had proudly proclaimed that

he was taking up his position “amidships” in the ship of state, i.e. that he would not go to either extreme, satisfying neither the demands being made by those without property that the ancestral land of Attica be redivided so that all would literally have a portion of it, nor the insistence of the aristocrats that the running of the city’s affairs should be left entirely in their hands: “to each side what it deserved”. The years 590/89 and 586/85 BC were designated in the official records as (literally) “anarchic”, because no chief magistrate had been elected, due to internal dissension. In 582/81 BC an otherwise unknown individual named Damasias attempted to hold on to the archonship for an illegal period beyond his official tenure, and there are indications of an experiment with some kind of block election of archons by social and economic grouping. With continuing unrest of this kind, it was only a matter of time before some opportunist succumbed to the temptation that Solon himself said that he had been strong enough to resist, of initiating a coup d’état and taking all power effectively into his own hands. (This had already happened in many other Greek states in the preceding two generations, and for a man in such a role the Greeks themselves had borrowed, possibly from the Lydians, the term “tyrant”.)

The later tradition remembered, and even thought it had evidence, that Solon himself both foresaw and tried to warn the Athenians of an impending coup by his kinsman (and, the gossipers said, former lover), Pisistratus. The men were related on the side of their mothers, both tracing their descent from an early king, Codrus, and thus from a junior branch of the royal house of Pylos. What can safely be asserted is that the remains of Solon’s poems have a scattering of dark hints that, if civil unrest should continue, Solon himself envisaged that an unscrupulous would-be autocrat would emerge to try to respond to the people’s demands; but in what survives of his work Solon nowhere mentions Pisistratus by name; nor does it seem likely that he would have overlapped with Pisistratus’ early, tentative gropings for power by more than a year or two.

Our earliest and fullest account of Pisistratus’ coup comes from Herodotus (the chronology for the early Pisistratean period is uncertain, but we are in the late 560s BC). What gave Pisistratus his chance was the fact that the city was beset by factional strife, the “Men of the Shore” being led by Megacles, son of Alcmaeon (Megacles had married into the “tyrant” family of Sicyon), and the “Men of the Plain” by a certain Lycurgus. Pisistratus organized his own followers under the title “Men from beyond [or “across”] the Hills”. Attempts have been made to discover here a classification beyond the merely geographical, perhaps according to some division along ideological or economic lines, but no suggestion has been entirely convincing. It

seems most probable that the names were chosen to give a rough indication of where the leaders lived and where they derived their support. Herodotus' flair for the dramatic may be leading him astray, but what he reports is that Pisistratus staged an attack on himself by his enemies, even going so far as to wound himself and claim that his enemies had done it. He reminded the Athenians of his services to them in earlier hostilities against Megara, and asked for a bodyguard. Thus reinforced, he established himself in power on the Acropolis, where the Athenian kings had resided in the Mycenaean period. His opponents put aside their squabbling and joined forces to drive him out, but Pisistratus was able to outmanoeuvre them by entering into a marriage alliance with Megacles. The alliance, like the marriage that was its surety, proved shortlived, and Pisistratus once again went into exile, this time for a ten-year period (on the likeliest chronology, c. 557–547 BC). He took the opportunity to make sure that he had the resources, financial and in manpower, to gain a secure grip on power. He turned to northern Greece, founding a colony on the Thermaic gulf and exploiting sources of silver near Mount Pangaeus; with this wealth (perhaps converted into a personal coinage) he hired mercenaries and called for additional support from Thebes, Argos, and the island of Naxos. Pisistratus and his troops landed near Marathon, near his family holdings and original power base in Attica at Brauron, and marched on Athens, to good omens and, if not exactly token opposition, at least a resistance that was only half-hearted; his sons were able to reassure the Athenians of their father's good intentions. To all but the disgruntled leaders of the aristocratic faction and their immediate coteries it must have appeared that a period of stability, no matter whose hand was at the tiller, was far preferable to the almost half-century of turmoil and the politics marked by family rivalries that had preceded it.

Greek writers of later periods invariably looked back on a time of autocracy as distasteful; the personal performances as well as the character of these early tyrants tended to be blackened, their shortcomings if not invented then considerably exaggerated and turned into bizarre perversions and even crimes. It is all the more surprising, therefore, that in our major sources Pisistratus comes off with a relatively clean record. Herodotus comments that Pisistratus ruled “without disturbing the previously existing offices or altering any of the laws; he administered the state according to the established usages and his arrangements were wise and salutary”. Of course there was no office of “tyrant”, nor do we have any indication that he assumed an actual title, such as “Protector of the Constitution”, but Thucydides reports that he “took care to see that one of his own men was in the archonship”. The writer of the *Constitution of Athens*

remarks: “his rule was more like a constitutional government than a tyranny”.

Pisistratus may have started as just another faction leader, but he seems to have grown in his rule. He took particular care to introduce measures that would perhaps not unify Attica in a literal sense (a role that political myth assigned to Theseus), but would at least make residents of outlying districts of the city itself feel loyalty to Athens as an integrated political entity. One especially strong weapon he had was that the religious cults tended to be situated locally and were invariably organized by the aristocratic families of the particular area. Archaeological and other evidence indicates that Pisistratus sponsored new or revitalized cults that broke down these local and class barriers and fostered a sense of unity. Thus at neighbouring Eleusis, where people of every class (including slaves) could be initiated into the mysteries of Demeter, which promised some kind of personal survival after death, a new *telesterion* or initiation house was built, and a shrine to Demeter was established in the city itself as a kind of district office of the cult. The career of the poet-dramatist Thespis (himself a somewhat legendary figure) was launched at Athens in the 530s BC, and it is possible that from this date there were regular performances there of some kind of proto-tragedy in honour of Dionysus. Probably another shrine to Dionysus, the Lenaion, was built in the Agora during this period. There were also various new cults of the god Apollo with separate cult titles (Hypoakraios on the west slope of the Acropolis, Patroos on the west side of the Agora), and one in particular, Apollo Pythios, appears to have been designed to compete with Delphi, with which Pisistratus was on rather cool terms. Pisistratus undertook a ritual purification of Apollo’s sacred island of Delos (by removing graves, making sacrifices etc.) immediately upon his final, firm assumption of power. This should probably be seen as an attempt to shift people’s attention away from Delphi, and is an anticipation of the centrality of Delos in Athenian imperial propaganda a century later.

There is no concord among archaeologists as to specifics, but most agree that an ambitious building programme was undertaken on the Acropolis. There was a large temple to the city’s patron goddess, Athena (variously styled the “Hekatompedon” or Athena’s “Old Temple”), and architectural sculpture survives – including the lively and amusing sea monster dubbed “Bluebird” in the Acropolis museum – that suggests that there are other “shrines” on a more modest scale. There was also a temple to Athena Nike, the “Bringer of Victory”, at the west end of the Acropolis, on the site where a later temple greets today’s visitors to the precinct. Nor were sacred structures the only ones in this building scheme (whether by Pisistratus or his sons – it is often difficult to be sure that the remains predate Pisistratus’ death in

528 BC). A fountain house named Enneakrounos, “Nine Spouts”, was built southeast of the Agora to bring fresh water down from the hills northeast of the city, guaranteeing an efficient and orderly water supply for the residents of Athens. The name of Pisistratus’ son Hipparchus is associated with an improvement in the road system connecting the central city, specifically the Altar of the Twelve Gods in the Agora which Hipparchus is said to have dedicated, with the outlying districts. Hipparchus was also remembered as an artistic entrepreneur; he is said to have invited the poets Anacreon and Simonides to take up residence in Athens, and to have been responsible for collecting manuscripts of Homer’s epics, perhaps as some kind of official text for competitions at the Panathenaic festival, which was probably not founded by Pisistratus, but may have been expanded under his patronage.

The Athenians were thus encouraged to be proud of their city and to visit it, if they lived in the countryside, as often as possible. Realistically, however, a rural Athenian spent most of his or her time on the family farm in the 6th century BC, even as later in the 5th century BC. Sculptors and artisans might be based in the city itself, and the upsurge in exports of fine black-figure Attic pottery suggests a thriving industry of production and export, but Pisistratus seems also to have taken to heart the plight of the Athenian fanner. He is reported to have made loans to the poor so that they could make a living by fanning (but he also charged a land tax of 5 or 10 per cent), and he set up a system of circuit judges who travelled the Attic countryside and settled legal disputes. As already noted, Pisistratus appears to have been careful in his observance of the forms of Athenian civic life, and, if a story told by the *Constitution of Athens* can be believed, he once even came before the Areopagus court to answer a charge of homicide; we are told that the plaintiff, perhaps not surprisingly, failed to appear. His rule was later remembered as a golden age, the “age of Cronus” (in contradistinction to the rather harsher Olympian rule of Cronus’ son and successor, Zeus). There is probably a good deal of truth to this, although the foreshortening of time and dimming of collective memory may have done something to enhance his reputation with later generations of Athenians.

The evidence of his dealings with the other aristocrats is somewhat ambiguous. The Alcmaeonidae, Megacles’ family, chose to play the role of martyrs. When Pisistratus died (probably 528 BC), there was no rush to substitute a different form of government or damn his memory, as happened with other Greek tyrannies; his eldest sons, Hippias and Hipparchus, may have been worried about possible competitors to succeed Pisistratus, and Herodotus reports that they had arranged for the assassination of the elder Cimon, who had won

multiple victories in the Olympic Games and so might have appeared as a plausible contender for supreme power. What appears to have been the sons' preferred tactic of neutralizing opposition, however, was diplomacy and cooption. There is inscriptional evidence that in the years immediately after Pisistratus' death the chief archonship was held by his son Hippias (526 BC), Cleisthenes the Alcmaeonid, the later lawgiver (525 BC), Miltiades, future victor at Marathon (524 BC), and the younger Pisistratus, the tyrant's grandson (523 BC).

The family's control of Athenian government finally came to an end in 510 BC after a period of turmoil. An assassination attempt in 514 BC was only partly successful: the tyrant Hippias' younger brother Hipparchus was killed though Hippias himself escaped. The sources uniformly report that the Pisistratids' rule (to give the family the name by which ancient writers refer to them) became much harsher. The aristocrats saw an opportunity to dislodge the family that had held the dominant position at Athens for 36 years, but this was managed only after several failed attempts, and with the assistance of some formidable propaganda from the Delphic oracle as well as an armed invading force led by a Spartan king.

Pisistratus' reign was crucial to the development of Athenian democracy. Under Pisistratus Athens' leading and ever-contentious families were either exiled or reduced to political impotence. If he had tampered with the Solonian institutions, much (though perhaps not all) would have been lost; Cleisthenes in 508 BC would have had to start, so to speak, from scratch. As it was, the Athenians were given a tantalizing taste of the fruits of political stability and peace (no foreign engagements of any consequence are recorded for the period of Pisistratus' rule, and it is a continuing puzzle whether he even maintained a standing army and navy). Athenian manufacture and trade flourished, and the fruits of this increased prosperity went to enhance life in both city and countryside. Local workers and craftsmen were given employment, and designers and artists were imported from the more artistically advanced regions of the Near East, such as Ionia. Athenians came to see that the advancement of Athens' interests was best viewed as a community enterprise and that, as their city prospered, so did their own individual circumstances. A century later, under Pericles, Athenians of all stripes and classes were to discover how advantageous a full public treasury could be.

Biography

Born in the early 6th century BC, Pisistratus first seized power in Athens in the 560s BC. After a ten-year exile (c.557–547) in Macedonia, he returned to Athens in 546 and

established a tyranny. The city flourished and the period of his rule was remembered as a golden age. He died c.528 BC and was succeeded by his sons Hippias and Hipparchus.

Plataea

City in Boeotia, site of a battle in 479 BC

Plataea was a city of southern Boeotia situated in the plain between Mount Cithaeron and the Asopus river. As the result of an attempt by Thebes to force it into the Boeotian Confederacy, the city joined an alliance with Athens in 519 BC. It subsequently provided support to the Athenians against the Persians at Marathon (490), Artemesium, and Salamis (480), before being sacked by the Persians in 479.

After the Greek victory over the Persian fleet in the bay of Salamis and Xerxes' subsequent withdrawal, the Greek forces still had to confront a substantial Persian army under the command of Mardonius. Plataea became the site of the great final battle between the Persian forces and the assembled Greek resistance in 479. The Greek victory ended the threat of Persian domination of Greece.

Mardonius, who had retired to Attica after Salamis, moved his forces to the plains of Boeotia, probably to provide more favourable terrain for his cavalry. The Peloponnesian forces, which had assembled at the isthmus, marched first to Eleusis where they were joined by the Athenians under Aristides, and then moved across the Cithaeron range along the main road and the pass of Eleutherae (Gyphthokastro).

Perhaps before engaging the Persians, the Greek allies swore the "Oath of Plataea", a pledge to fight to the death against the Persians, remain loyal to one's allies, and not rebuild the temples destroyed by the Persians. Denounced even in antiquity as a forgery (Theopompus, *FGrH* 115 F 153), scholars still debate its authenticity and its location and date of swearing.

At the battle the Spartan regent, Pausanias, led the Greek forces to victory against a numerically superior Persian foe. Herodotus' estimate for the Persian force (300,000 Persians and 50,000 Medizing Greeks, i.e. Greeks who sided with the Persians) is not accepted, although his numbers for the Greek forces (38,700 hoplites and 71,300 light or unarmed auxiliaries) are given more credence. Modern estimates give the Persians a cavalry of 10,000 with 50,000 to 70,000 infantry (plus support), perhaps 20,000 Medizing Greeks, and another Persian force of 40,000 under another commander, Artabazus.

Many details of the battle itself are still not agreed upon. After more than two millennia, changes to topographical features have made troop positions and movements impossible to prove. Even the specific date of the engagement is unknown, although mid-August of 479 is widely accepted. The general strategies of the two sides, however, seem clear: the Persians wished to employ their cavalry on the plain, while the Greek force, using hoplites in phalanx formation, preferred not to give them that advantage.

With the main Persian force assembled along a front, perhaps 8 km long, north of the Asopus with a 2-km square wooden stockade (c.900 acres/360 ha) to their rear, Pausanias utilized the rough terrain of his position on the lower slopes of Mount Cithaeron successfully to fight off the Persian cavalry, killing their majestic commander Masistius. Pausanias then shifted his line westward towards Plataea and the Asopus, perhaps in need of better water supplies, and moved further down the slopes. The Persians were able to deny the Greeks the river by employing their mounted archers to harass parties sent to collect water. Eventually the Persians also choked up the Gargaphia spring, a major water source for the entire Greek force; this may have forced the Greeks to attempt a more desperate course of action.

For eight days the two forces faced each other across the Asopus, neither side willing to give up its favourable terrain to attack. But

after four days of raids by Mardonius' cavalry, which cut the Greeks' supply lines, Pausanias made the decision to attempt a night withdrawal to secure provisions. Confusion during the withdrawal resulted in the division of the Greek forces: the Athenians were isolated on the left, the centre just outside Plataea itself, and the Lacedaemonians and Tegeans on the right.

Mardonius, sensing that the advantage was his, ordered a general assault but, after a furious battle, the Spartans defeated his Asiatic and allied troops. The Athenians held his Boeotian allies, who fought well but disengaged under the protection of the Theban cavalry once the battle against the Greek right had been lost. Mardonius himself died in the battle, triggering a Persian retreat into the stockade where they were slaughtered once the Greeks breached its walls. Artabazus, who had maintained his troops in reserve, watched the battle develop into a rout, then retreated to Byzantium without fighting. Attempts have been made to depict the Greek victory as a brilliant ploy on the part of Pausanias, but it is impossible now to determine whether the victory was a result of luck or a clever plan.

Casualties are difficult to estimate, but the Persians probably lost about 10,000 non-European warriors and 1000 Medizing Greeks; the Greek forces suffered casualties of perhaps just over 1000 men. The Greeks had won a resounding victory that demonstrated they could inflict tremendous punishment upon a numerically superior Persian force. The Persians were no longer a military threat to the Greek mainland.

Booty from the battle was tremendous. Dedications from the spoils were made at Olympia, the isthmus, and Delphi (the triple entwined serpent-column, the remains of which is now in Istanbul, was erected on a gold tripod at Delphi). So luxurious were the spoils that this is the moment cited in antiquity when the Greeks became enamoured of wealth.

To complete their victory, the Greeks turned to punish Thebes for its support of the Persians. After a short siege, several ringleaders were surrendered to allies, who quickly removed them to the isthmus where they were executed. Theban hegemony over Boeotia was also broken.

Even more than Marathon or Salamis, the victory over the Persians at Plataea determined the course of European history. Xerxes had been defeated at sea and on land. Instead of becoming a Persian satellite, the Greeks formed the Delian League and went on the offensive.

Plataea faded in significance after the battle until the middle of the 5th century when it joined the new Boeotian Confederacy with control of two votes. The Theban assault on the city in 431 is regarded by many as the real beginning of the Peloponnesian War and, although

most inhabitants had fled to Athens for refuge, the remaining inhabitants only surrendered in 427 when the city was razed to the ground. Plataea was rebuilt after the war and remained independent until seized by the Thebans in 372, when refugees once again fled to Athens. Philip II of Macedon restored the city after the battle of Chaeronea (338) and the Plataeans exacted revenge against Thebes in 335 when they helped Alexander the Great destroy their old enemy. Although loyal to Rome during the Third Macedonian War, the city suffered along with the other Boeotian cities during the campaigns of Sulla in 86 BC.

Two cults, the Homonoia and the Eleutheria, which celebrated the great victory over the Persians, provided some fame for the city in the Hellenistic and Roman periods, but other than the restoration of its walls under Justinian (527–65) little else of significance is known about the city.

Plato 429–347 BC

Philosopher

Plato was destined for an active life in Athenian politics. He was a member of an Athenian family that traced its origins back to the famous lawgiver Solon, and although his close relatives Crito and Chanmides were discredited by their actions during the constitutional disturbances of the last decade of the 5th century BC, Plato could have carved out his own path. As Plato himself tells us in his *Seventh Letter* (now taken to be genuine by most scholars), he indeed began adult life with the usual political ambitions and was invited by his relatives to join them. Their actions were repellent, but what finally deterred Plato from ever taking part in conventional political life was the way in which powerful people brought charges against Socrates that led to his death, an action that in Plato's mind condemned both the oligarchic forces and the democratic masses. He would now devote his life to unconventional politics; that is, "having decided that all existing cities are badly governed", he would investigate "the nature of justice in both the individual and the state".

Plato would have had very few models for his own investigations. Greeks by and large looked to poets for ethical paradigms and heroes. Heraclitus wove ethical doctrines into an intentionally enigmatic prose text that lacked the detail and argumentative rigour that Plato desired. Some of the Sophists dealt with ethical matters but did so less with a desire to learn the truth and more in order to train students to come out on top in any morally ambiguous situation. Plato found his model in what was then a minor genre, the Socratic dialogue; that is, a prose drama in which Socrates and one or more fellow speakers (dialogists) would raise and analyse, or at any rate discuss, ethical matters. According to Aristotle, the first to write Socratic dialogues was a certain Alexamenos of Teos. There is also credible evidence that an Athenian, Simon the cobbler, would scribble notes for himself that he would later work up into a more polished form. How philosophical

these earlier dialogues were we can only guess. They may have been similar to the chatty and anecdotal Socratic dialogues of Xenophon that are still extant. But whereas Xenophon was chiefly interested in retelling those conversations in which Socrates expressed his own views, Plato was more drawn to the Socrates who, when it came to the most important qualities of ethical life, preferred to withhold his own opinions, frequently willing to bring the discussion to an impasse (*aporia*) rather than impose upon his fellow dialogists a conclusion that he himself could not fully endorse.

Socrates did this in part because, as he himself is made to say in Plato's *Apology*, the profession of one's own ignorance is a necessary first step on the way to the truth. He also, again according to Plato, believed that whatever truth one does attain will occur only as a result of one's having actively wrestled with the matter and elicited it out of one's own soul – a difficult matter, to be sure, but possible for a bright person who is asked the right questions. Plato, who no doubt often found himself in this situation with Socrates, proceeded to shape both real and imagined dialogues with this intriguing old man into a powerful literary form. There is therefore no voice within the dialogues that declares itself to be that of the author arguing his own cause; nor does Plato even put himself forward as narrator of any dialogue. The reader is thus put on constant guard, never sure at first or perhaps even after consideration whether any particular idea expressed by Socrates or anyone else comes with Plato's own endorsement. This is Plato's way of reproducing Socrates' habit of encouraging would-be philosophers to work things out as much as possible by themselves.

Quite naturally, therefore, apart from the speech that forms the *Apology*, Plato's earliest dialogues tend to end in the doubt that earns them the label "aporetic". Plato brings Socrates together somewhere in Athens with one or more acquaintances. Whether or not they have a specific question for him, Socrates soon raises the level of discussion from the ordinary to the philosophical. In the *Laches*, for example, the question of how fathers can educate sons in bravery quickly becomes an investigation of the very meaning of bravery. The *Euthyphro*, *Lysis*, and *Charmides* deal likewise (and respectively) with the other commonly recognized virtues of piety, friendship, and *sophrosyne* (for which "temperance, prudence, moderation" are but inadequate translations). The *Hippias Major* (whose authenticity is still doubted by some) seeks to define *kalon* ("good" or "beautiful"), a term that comprises both aesthetic and moral values. Perhaps most aporetic of all is the *Hippias Minor*, which manages to shock even Socrates when the dialogue leads him and Hippias to the statement that the man who does wrong willingly is superior to the man who does so only

involuntarily. And while not aporetic, the moral message of the *Crito* is clear: Socrates owes a debt to Athens that will not allow him to escape from prison, where he lies under sentence of death.

A question that is raised more than once in these early dialogues, most noticeably in the *Laches*, is how, supposing that we can ever attain a sufficiently correct opinion concerning these individual virtues, can one generation instil them in the next. This is an important question at any time, but Plato's 4th-century BC Athens was still feeling the effects of Socrates' 5th-century BC Sophists, the professional teachers who come off so badly in Plato's dialogues not so much for their pretentious ways and their love of money as for their claim to be able to teach virtue. Whereas Hippias in the *Hippias Minor* is artfully led to an immoral conclusion unwillingly, the Sophists of the *Euthydemus* with malicious glee delight in their ability to twist the normal ambiguities of ordinary language into startling paradoxical statements, a skill that they claim will enable a citizen to excel in the law courts or wherever such "eristic" skills are valuable. The question of whether virtue can be taught at all is addressed head on in the *Protagoras*. At first, Protagoras understandably argues with a sceptical Socrates that virtue (*arete*) can indeed be taught, and by no one so well as he. In the course of the discussion, however, they somehow change sides so that by the end it is Socrates who now believes that virtue is teachable, Protagoras arguing against his earlier position. This aporetic turnabout, artfully stage-managed by Socrates and Plato, has the desired result that Socrates' young friend who had been on the point of paying Protagoras his huge fee to learn virtue is now almost certainly deterred from doing so.

Whereas up to this point Plato was content to reveal the essentially immoral nature of sophistic teaching by indirection, in the *Gorgias* he starkly reveals the results of these ill-thought-out doctrines. Gorgias himself is shown merely to be morally purblind. His students, however, Polus and Callicles, provide examples of the totalitarian political character who embraces the idea that might makes right. Another student of Gorgias reveals in the *Meno* how little he knows about the nature of virtue (as opposed to its many manifestations in different people and situations).

Having shown in so many dialogues both the existence of widespread ignorance on ethical matters and the necessity for exposing its many forms, it was time for Plato to flesh out some of the many hints he dropped in the aporetic dialogues of a more positive doctrine. In the deathbed setting of *Phaedo*, Socrates not only elaborates on his earlier statements in the *Apology* and *Crito* on the necessity of devoting one's life to the study of wisdom (which is the very serious meaning he gives to the word *philosophia*), he describes

the immortality of the soul and those entities he calls Ideas or Forms. (In the *Meno* real learning was said to be the immortal soul actually recollecting what it had known before.) Although the metaphysical nature of the Forms is often studied by itself, when viewed in their contexts the Forms clearly represent an essential part of Plato's overarching ethical programme. While it is not difficult to enumerate the qualities of these unchanging, eternal, and immanent Forms, it is quite another thing to explain how one might attain direct apprehension of them for oneself.

The *Phaedo* shows how even Socrates' own most devoted followers can accept the immortality of the soul (not a difficult thing for a Greek) and yet prove incapable of absorbing it into their philosophical belief. The immortality of the Forms is even more difficult to incorporate. The *Symposium*, primarily about love, likens the apprehension of the Forms to the initiation into a mystery religion, which cannot be revealed to an outsider. In the *Republic*, however, Plato took the plunge, sketching out (his metaphor) an elaborate scheme for instituting and governing a state where justice would prevail in both its own constitution and in the very souls of its citizens. Its first book (of ten) is modelled on an aporetic dialogue in which the object of discussion is justice. Socrates, however, not allowed to run off after having dispelled various mistaken notions, is compelled to continue with a more positive doctrine of justice, which, it turns out, governs some of the cardinal virtues treated in earlier dialogues. Maintaining the proper relationship among the parts of the soul makes for a just individual, who in turn along with a like-minded citizenry will serve the state – whether as ruler or follower – so that all elements work together in a harmony that Socrates calls justice. Rulers can come only from that elite group of men and women who have pursued a course of education so rigorous that they are able to apprehend the Form of the Good, the nature of which demands that they work for the good of the state. Complementary to the idea that Good demands good is the Socratic paradox that nobody does wrong willingly.

The *Phaedrus*, like the *Symposium*, seeks to understand love through speeches; here, however, Socrates emphasizes less the content of a speech than its form, which, it is argued, should be clearly and naturally articulated. This notion of proper composition calls for a discussion of what Plato will develop in later dialogues, namely analysis of the subject to be defined by a process of collection (of all similar things) and division (of the whole into its parts). The *Phaedrus* is one of Plato's great literary accomplishments. On the whole, however, it may be said that after having considered, with some justification, the *Republic* as the culmination of all of his earlier virtue-

oriented writings, Plato now felt free to explore and develop some of the logical consequences of his theory of Forms. This is not to say that the later dialogues lack all literary touches – the *Theaetetus*, for example, is informed by metaphors of pregnancy and birth that illuminate the process whereby Theaetetus is questioned on the meaning of knowledge – but it must be admitted that the *Sophist*, *Statesman*, and *Philebus* have far fewer readers (outside philosophy departments) than the earlier dialogues. Among late dialogues, perhaps only the *Timaeus*, with its fascinating attempt to describe the cosmos by marrying Greek science and religion, commands a wide readership. The *Laws*, the longest dialogue, both complements and, as an older and more conservative Plato must have imagined it, corrects the picture of the ideal state described earlier in the *Republic*.

Plato's influence on later thought was felt immediately and has lasted until the present. The school he founded in the sacred grove known as the Academy lasted until the 6th century AD. Aristotle, denied advancement with the Academy, continued with his own school in Athens and in his writings continued until the end of his life to argue with his teacher. Nor could any other school of western philosophy ignore him; they either adopted, adapted, or overtly rejected the basic doctrines of Plato.

Biography

Born in Athens in 429 BC to an ancient and wealthy family, Plato was destined for a political career but decided to devote himself to philosophy after the death of Socrates. He founded a philosophical school known as the Academy whose original aim was to train prospective statesmen. He visited Syracuse several times in a vain attempt to convert Dionysius II to his philosophical ideas. He published his theories in the form of dialogues, dramatic conversation pieces, of which some 30 survive. He died in 347 BC.

Writings

Opera (texts in Greek), edited by John Burnet, 5 vols, Oxford: Clarendon Press, 1900–07.
The Dialogues, translated by Benjamin Jowett, 4 vols, Oxford: Clarendon Press, and New York: Scribner, 1868–1871; new edition, edited by D.J. Allan and H.E. Dale, 4 vols, Clarendon Press, 1953.
Dialogues, translated by H.N. Fowler et al., 15 vols, London: Heinemann, and Cambridge, Massachusetts: Harvard University Press, 1914–1935 (Loeb edition; many reprints).
Collected Dialogues, edited by Edith Hamilton and Huntington Cairns, New York: Pantheon, 1961.
The Dialogues, translated by R.E. Allen, New Haven and London: Yale University Press, 1985–.
The Collected Dialogues, edited by John Cooper, Indianapolis: Hackett, 1997.

Plotinus AD 205–269/70

Philosopher

Plotinus was the most influential and important philosopher of ancient Greece after Plato and Aristotle. His philosophical system, though based primarily on Plato, was deeply influenced by Aristotle. Stoicism, too, was an important ingredient as well as the ideas of those intervening philosophers and scholars who commented on, developed, and frequently sought a rapprochement between the thought of their great predecessors. His influence, at first direct, on his successors Porphyry, Iamblichus, and Proclus and, subsequently, indirectly through them, on later thinkers had a profound and lasting impact on the way in which Greek philosophy, and particularly Plato, was viewed and on the development of Christian theology, particularly in the Orthodox tradition, which was more receptive of Platonic ideas than the western Church. It is, then, important to grasp some of the basic tenets of Neoplatonism that were given their classic shape by Plotinus, though refined and systematized by later Neoplatonists.

Although Plotinus was deeply imbued with the philosophy of

Aristotle as well as that of the Stoics, he regarded himself primarily as a follower of Plato, the hidden implications of whose works he sought to explicate and develop. The term Neoplatonist is modern and Plotinus would have regarded himself simply as a Platonist. He came from Lycopolis in Egypt and was educated in the philosophical schools of Alexandria. Political circumstances brought him to Rome where he founded a school in a private house. He did not start to write down his ideas until he was 50 years old and his system was well thought out, but his treatises give the impression of a lively philosophical dialogue, at times almost of a seminar, in which problems, issues, and objections are thoroughly aired. His treatises were not published until many years after his death by his pupil Porphyry who arranged them in sets of nine: hence the curious title *Enneads*. One result of Porphyry's diligent work as an editor is that Plotinus is the only philosopher of antiquity whose works survive in their entirety.

Plotinus laid great emphasis on the two-world view of Plato, who regarded the physical world as an image of a transcendent world of archetypal Forms and the true home of the soul which, during its earthly life, may be considered to be in exile. Plotinus, however, gave far greater stress to this sense of exile and the necessity for the soul to divest itself of its earthly burdens and return to its original home by a process of moral and intellectual effort leading to mystical union with the supreme principle. At the same time, however, he could see the physical world, in the optimistic context of Plato's *Timaeus*, as the best possible image of its divine maker, indeed as a god in its own right. The idea of return to God as father from exile in this world and the spiritual earnestness with which it was expressed by Plotinus were naturally appealing to Christian writers such as Basil. For Plotinus, however, this return of the soul was not dependent on the grace of God but on the innate capacity that we all have, if only we would use it, to recognize our own worth, our kinship, and ultimate identity with the divine. Plotinus himself had little time for religious cults and even less time for those such as the Gnostics who denigrated the physical universe as the creation of a fallen God.

Equally appealing and influential was Plotinus' complex development of Plato's transcendent world into three levels: above all is the One, the source of all, which gives rise to Intellect (*nous*) from which Soul derives. Although these levels of reality are subordinate to each other, they provided a fertile source for Christian Trinitarian theology. Less obvious but more subtly influential were his complex speculations about the relationships within Intellect which provided a model and a language that Christian theologians could employ to describe mutual relationships within the Godhead. For Plotinus thinker, thinking, and object of thought are substantially identical,

though conceptually distinct. The concept of the One also proved influential. For Plotinus this ultimate principle, source of all unity, was beyond all description. It could be indicated only by affirming what it was not. This so-called negative or apophatic theology was to have a long following, including Gregory of Nyssa and pseudo-Dionysius. Equally influential was the way in which Plotinus attempted to describe and analyse his personal mystical union with the One, “the flight of the alone to the alone”.

The *Enneads* were read and quoted by Eusebius of Caesarea, Basil the Great, and Gregory of Nyssa. They became fashionable again in the 11th century partly through the interest of Michael Psellos, who also knew Proclus’ commentary on them. In the 15th century Gemistos Plethon’s Neoplatonic religion owed much to Plotinus and it was his pupil Bessarion who brought manuscripts of Plotinus to the west. But the indirect influence of Plotinus is probably of even greater importance for the Greek east. Although Plotinus had never been official head of the Academy or even visited Athens, his interpretation of Plato gradually became accepted and more systematically developed under a sequence of Academy heads including Plutarch of Athens, Syrianus, and, most importantly of all, Proclus, whose works had a profound influence on pseudo-Dionysius the Areopagite. The great pagan philosophical and Christian centre of Alexandria was also influenced both directly and through the Academy at Athens, as scholars moved freely between the two cities. Although this form of later Neoplatonism was in many respects quite different from that of Plotinus, the *Enneads* remain the vital source and the most dynamic exposition of Neoplatonic ideas and thus the essential text to which all subsequent Neoplatonists have returned and from which all modern study of Neoplatonism takes its start.

Biography

Born at Lycopolis in Egypt in AD 205, Plotinus was educated in Alexandria where he was a pupil of Ammonius Sacas. In 245 he moved to Rome where he founded a school and taught philosophy. His pupils included Porphyry. Plotinus was the greatest of the Neoplatonists and wrote philosophical treatises which were published after his death by Porphyry as *Enneads*. He died in Campania in 269/70.

Plutarch c.^{AD} 50–120

Prose writer

Plutarch came from the Boeotian town of Chaeronea where he lived for most of his life. In his writings there are regular references to various local landmarks, such as the tomb of Lysander on the road leading from Delphi to Chaeronea (*Lysander*, 29. 3). These details cumulatively suggest his fondness for his birthplace, which he once wryly said that he did not wish to leave, for fear of making a small place even smaller (*Demosthenes*, 2. 2). In addition we have an inscription from the base of a statue which was found in Chaeronea: “Philinus dedicated to the gods [this statue of] Plutarch the benefactor” (W. Dittenberger, *Sylloge Inscriptionum Graecarum*, 3rd edition, 1915–24, 843B). This inscription shows that Plutarch had a warm relationship with his home town, but it is clear from his writings that he still found time to travel. Thus at Ravenna Plutarch claims to have seen a statue of Marius (*Marius*, 2. 1), and in northern Italy, when he was travelling with his friend the ex-consul Mestrius Florus, he visited the civil war battlefield at Bedriacum (*Otho*, 14. 2). For the last 30 years of his life Plutarch was a priest at the Greek sanctuary of Delphi (*Moralia*, 792F) and the knowledge of antiquities that he acquired there can be seen throughout his works. For example, Plutarch notes that there existed at Delphi a statue of *Aphrodite of the Tomb* and he uses this fact to suggest why the Romans used to sell items for funerals in the precinct of Libitina/Venus (*Moralia*, 269B). In addition he wrote whole essays that draw on his knowledge of Delphi, including *On the Pythia's Prophecies* and *On the Delphic E*.

Plutarch undoubtedly loved Greece, but at the same time he was a Roman citizen, as we know from an inscription that refers to him as Mestrius Plutarch (Dittenberger, 843B). This name suggests a link between his acquisition of citizenship and his friendship with Mestrius Florus, who was one of a circle of influential Plutarchan contacts that also included Sosius Senecio, to whom the *Parallel Lives* are dedicated. Thus Plutarch was a Janus figure, a Roman citizen who retained a strong Greek identity, but who could see positive qualities in both cultures. Plutarch valued the stability that came with the Roman

imperial system (*Moralia*, 317C), but saw the influence of Greek culture on Rome as valuable and even as necessary: “for the time in which Rome reached its greatest success was the time when it welcomed Greek studies and education” (*Cato the Elder*, 23. 3).

Plutarch’s most remarkable achievement lies in his vastly rich and varied body of written work. The Catalogue of Lamprias, which is itself incomplete, lists 227 different works. Today we possess 78 essays by Plutarch on a range of topics, which are known collectively as the *Moralia*, and 50 *Lives*. Subjects that Plutarch addresses in the *Moralia* include philosophical questions, historical issues, religious antiquities, rhetoric, and literary themes. Plutarch’s most popular works, however, are the *Parallel Lives*, in which he presents pairs of biographies, one of a Greek and one of a Roman protagonist, including in most cases a brief comparison or *synkrisis* at the end. These *Parallel Lives* were not Plutarch’s first attempt at writing biography. Probably before AD 96 he had composed the *Lives of the Caesars* about the eight Roman emperors from Augustus to Vitellius. Unfortunately, only the *Galba* and the *Otho* have survived, although there is some material in the *Moralia* that it is tempting to think may have appeared in the other lost imperial *Lives of the Caesars*. For a man who claims that his knowledge of Latin was acquired later in life (*Demosthenes*, 2. 2. 4) researching these imperial biographies cannot have been easy and Plutarch certainly did not have the advantages of the later imperial biographer Suetonius, whose post as imperial secretary gave him access to some unique documents and archives about the emperors. However, Plutarch persevered with his reading of Latin sources when researching the subjects of his *Parallel Lives*. This strategy of pairing Greek and Roman lives was innovative and symptomatic of an era when interaction between Greek and Roman cultures was gaining momentum: the *Parallel Lives* appear to have been written early in the 2nd century AD under the more enlightened principates of Trajan (emperor AD 98–117) and Hadrian (emperor AD 117–38). Previously, biographers such as Cornelius Nepos and Varro had certainly written groups of lives centring on men of a particular profession, such as orators, poets, and generals, but Plutarch allowed himself the potential for developing vivid and subtle portraits by restricting himself to delineating only two subjects at a time in the *Parallel Lives*, apart from the one double pairing of *Agis and Cleomenes* and *Tiberius and Gaius Gracchus*. His biographical corpus as a whole was extensive, but he kept his readers’ interest alive by his tremendous powers of description and by his astute eye for detail. As Plutarch famously says: “Nor is it always the most famous actions which reveal a man’s good or bad qualities: a clearer insight into a man’s character is often given by a small matter, a word or jest, than by engagements where

thousands die" (*Alexander*, 1. 1–2). Rather than offer long authorial analysis of an individual's personality, Plutarch often allows character to emerge from carefully chosen anecdotes, which enable readers to draw their own conclusions about the subject of the biography. Moreover, Plutarch often devotes considerable attention to characterizing other protagonists in his biographies. For example, his portrait of Cleopatra in the *Antony* is unforgettably vibrant, and by serving as a foil to Antony, the Egyptian queen further deepens our understanding of the Roman general.

Plutarch's writings rapidly became popular. In the Byzantine era there were more transcriptions made of Plutarch than of any other ancient author. Strikingly, one scholar, John Tzetzes (died c.1180), when he fell on hard times, resigned himself to selling almost all his library but refused to part with his Plutarch. The individual to whom we owe the greatest debt for the preservation of Plutarch's works is undoubtedly Maximus Planudes. In 1294/95 Planudes, who was devoted to Plutarch, assembled a group of scribes whose task was to make copies of a large portion of the *Moralia*, as well as the *Galba* and the *Otho*. The *Parallel Lives* and the remaining essays from the *Moralia* were added to the project in 1296. Without Planudes's determination to collect the scattered pieces of the Plutarchan corpus we would almost certainly have had a much more fragmentary knowledge of Plutarch's work today. Testimony to the continuing interest in Plutarch can be found in the pervasive but inaccurate medieval tradition that the author had served as tutor to the emperor Trajan, just as Aristotle taught Alexander. There is even a Latin version of a "letter" supposedly written by Plutarch to Trajan and consisting of a compilation of quotations from the surviving works. During the Renaissance Plutarch was translated into French by Amyot (*Lives* 1559 and *Moralia* 1572) and into English (via the French) by North (*Lives* 1579). Material from Plutarch was also used by William Barker in 1578 to supplement the incomplete text of Appian on the civil wars. Such translations provided crucial inspiration for Shakespeare and Montaigne. More recently Mary Shelley made Frankenstein's monster a devotee of Plutarch's *Lives* and Harry S. Truman allegedly learned some valuable political lessons through reading the *Lives*. Today Plutarchan studies are thriving on a global level: not only is there *Ploutarchos*, the journal of the International Plutarch Society edited by Dr F. Titchener, but one can also access *Chaironeia*, a lively site devoted to Plutarch on the World Wide Web maintained by the University of Texas.

Poetry, Epic

“Homer is enough for everyone”, remarked Theocritus (16. 20), and interestingly this is true: the Homeric poems stand at the beginning of extant Greek literature, and the scope of their achievement is such that they constitute defining examples of what came to be known as epic poetry, as well as becoming a fixed standard against which all subsequent epics were assessed. An epic on the Homeric model is a substantial narrative poem that is composed in dactylic hexameters, that has an elevated tone, and that concerns the exploits of gods and heroes, the subject matter being drawn from traditional myth. Epic poetry also had numerous conventional features: formulaic language, frequent archaisms, extensive use of parataxis, ring-composition, type-scenes (e.g. describing arming, dining, etc.), digressions, and extended similes. This picture is consistent with modern notions of what constitutes epic; the ancient understanding of the genre, however, remains uncertain in important respects. The word “epic” – derived from *epos*, literally “word” – seems originally to have been used chiefly of poetry composed in dactylic hexameters (not only the Homeric poems), but also didactic poetry in the Hesiodic tradition and of philosophical poems by early philosophers, such as Parmenides and Empedocles. In later antiquity the term was applied more narrowly to the genre exemplified by the Homeric poems. It is not clear precisely when *epos* became “epic” in the modern sense, although it seems that some idea of an epic genre is implicit in Aristotle’s treatment of poetry.

Aristotle’s *Poetics* was enormously influential in consolidating and determining ancient views of the genre. Although ostensibly concerned with tragic poetry, the *Poetics* refers to the Homeric poems more often than to any tragic text, and Aristotle’s keen engagement with epic is everywhere in evidence (chapters 23 and 24 are particularly relevant). Central for Aristotle is the organic unity of plot (*mythos*), which must comprise a “beginning, middle, and end”. As in the case of tragedy, epic plots should be compact, and their unity should reside in events, not character. In this light he called attention to the conspicuous superiority of the Homeric poems and compared them favourably with other products of the early epic tradition. Later critics occasionally offered a broader definition of epic, suggesting, for example, that didactic and pastoral poetry be included (Quintilian, 10. 1. 46, 10. 1. 85), but the view implicit in Aristotle’s *Poetics* remained dominant, constituting a point of departure for later poets.

As early as Aristotle (e.g. *Rhetorica*, 1406b3; *Poetics*, 1459b35),

commentators had regularly viewed many of the conventional features as simply characteristic of epic dignity; during the 20th century scholars have determined that the style of Homeric poetry and the character of its narrative were indicative of the oral nature of epic poetry in early Greece, and that many apparently idiosyncratic features of these poems were rooted in a tradition of at least partially improvised song. This has led to a widely accepted distinction between “primary”, or traditional oral epic and “secondary”, or literate epic, the familiar tradition of epic poetry composed with the aid of writing by a literate poet.

It is important to note that the *Iliad* and the *Odyssey* were not the sole products of the early epic tradition. There is evidence for a series of poems called the Epic Cycle, which seem to have offered an account of the world from the beginning to the close of the heroic age. None of these poems is extant, but fragmentary evidence – most notably summaries of a number in various late mythographers (of especial importance are those by Proclus) – allows us to form some impression of the series. Best attested are the poems describing the Trojan War. The *Cypria* provided the background to the war and events leading up to the point at which the *Iliad* begins. There is some evidence to suggest that the beginning and the end of the *Iliad* were adapted to fit more comfortably in the sequence. The sequel to the *Iliad* was provided by the *Aethiopis*, the *Little Iliad*, and the *Iliou Persis*. These poems follow the Trojan myth from the death of Hector to the sack of Troy and the departure of the Greeks. The *Nostoi*, which detailed the homeward journeys of some of the central Greek warriors, marks a transition to the *Odyssey*, the action of which was followed by *Telegonia*, which brought an end to the story of Odysseus’ life. In addition to the Trojan War epics, the Epic Cycle is known to have comprised shorter poems on largely unrelated mythic themes: a *Theogony* and *Titanomachy*, covering ground familiar from Hesiod; and an *Oedipodia*, *Thebais*, and *Epigonoï*, providing influential treatment of Theban myths. Other early epics were no doubt in circulation in antiquity, and some may have been included in the Epic Cycle, but no trace of such an ascription can be found among extant ancient sources. We are aware of a number of other poems from the 7th and 6th centuries BC that are often described as epics, although that term may simply mean that they were hexametric. Some of these shadowy poems, such as the *Naupactia* and the *Theseis*, seem to have treated traditional myths; others, like the *Arimaspea* ascribed to Aristeas of Proconnesus, seem to have had affinities with other poetic traditions.

The whole Epic Cycle was ascribed to Homer by many, but other poets are frequently named. Among them are Stasinus, Arctinus, Lesches, and Thestorides, although today these poets are at best little

more than names. The Homeric ascription is none the less telling, for it reflects the character of these poems and the way in which they complement the *Iliad* and the *Odyssey*, and in this latter point we can discern the underlying motivation for the formation of the Epic Cycle. As the adjustments made to the beginning and end of the *Iliad* suggest, the cycle's sequence is not natural and indicates some kind of editorial intervention. The precise nature and date of this intervention, however, remain uncertain. Whereas explicit mention of the cycle as a whole is not found until late antiquity, the Trojan cycle seems to have been current at least as early as the 4th century BC, when the alternative beginning of the *Iliad* is first attested.

Although evidence of the existence of the Epic Cycle is too fragmentary to allow any certainty, it is likely that the cycle, along with the Homeric poems, represented a fixing of the oral tradition of epic in textual form, and this may be true of the other epics known from the early period. The transition to "secondary" epic seems to begin in the 5th century BC. Panyassis of Halicarnassus, who was a kinsman of the historian Herodotus, wrote a *Heraclea* that was well regarded by ancient critics. Although the few surviving fragments seem to reflect the conventional language of oral epic, we seem for the first time to be confronted with a poet who was clearly a historical personage. More noteworthy was the *Thebais* of Antimachus of Colophon, who flourished at the end of the 5th century BC. Although few fragments of any length survive, it is clear both from what little remains and from the ancient *testimonia* that Antimachus' work was characterized by a new sensibility that manipulated the language of epic in a selfconscious way. For subject matter Antimachus looked back to the Theban myths of the *Thebais* from the Epic Cycle, but his treatment seems to have anticipated the learned and allusive manner of Alexandrian poetry. Another notable development from about the same time is the work of Choerilus of Samos, whose *Persica* treats a historical subject, the Persian invasion of Greece. Hexametric poetry on historical subjects is first attested in the second half of the 8th century BC with the *Corinthiaca* ascribed to Eumelus, but Choerilus' *Persica* is the first known work to present what is clearly an epic treatment of such a theme. Although this poem survives only in brief fragments (some of them on papyrus), we are fortunate in having a few lines (fr. 317 SH) that seem to derive from a passage (possibly the proem) in which the poet addressed the issue of stylistic innovation.

It is difficult to gauge with certainty the degree to which epic flourished in the post-Classical world. There is considerable evidence for poems in hexameters – a number clearly of some length – and this has led many to conclude that the literary landscape of the Hellenistic world was richly populated with many epic poems that are now lost.

Other scholars are more sceptical, arguing that hexametric poetry is not necessarily epic; these lost poems could easily have been accounts of historical events or panegyrics. Whatever the truth of the matter, it remains nonetheless true that the Hellenistic world provides some striking responses to the challenge posed by the Homeric poems. The most obvious of these is the *Argonautica* of Apollonius of Rhodes, a product of the scholarly world of the royal library at Alexandria and the only epic extant from the period between the Homeric poems and the imperial period. Apollonius' epic is a creative reworking of the Homeric poems that recounts the expedition of Jason and the Argonauts in quest of the golden fleece. Apollonius' response to Homer is flexible and subtle, drawing on Homeric language and narrative manner yet producing an epic very different from the Homeric poems, one that is very much rooted in the tastes and preoccupations of the literary circle of the Alexandrian court.

Equally notable was the epic written by Apollonius' contemporary, Callimachus, whose (now fragmentary) *Hecale* represented a striking attempt to produce a new kind of epic. The poem recounted the reception of Theseus by a humble old woman named Hecale on the night before the hero was to face the bull of Marathon. The time-frame of the poem seems to have covered little more than a single day, but through the careful use of digression, flashback, and foreshadowing, the poet offered considerable insight into the two central figures. The focus on Hecale's humble hospitality rather than the celebrated combat with the bull seems to indicate a deliberate attempt to reposition epic tone; it is as though the *Odyssey* were to be retold from the point of view of Eumaeus or Erycleia.

The most influential successors to the Alexandrians were Roman poets such as Virgil, Ovid, and Lucan. But Greek epic continued to be composed in the imperial period. Quintus of Smyrna, writing in the 3rd century AD, produced the *Posthomeric* in 14 books, which dispenses with the familiar epic proem and continues directly from the last line of the *Iliad* to treat the Trojan myth that originally formed part of the Epic Cycle. On a more ambitious scale was the *Dionysiaca* of Nonnus of Panopolis. Composed in 48 books – the aggregate total of the *Iliad* and the *Odyssey* – this poem narrated the birth of Dionysus and his battles in India. Nonnus' elaborate language and highly rhetorical manner constitute an attempt to forge a new kind of epic style; in his detailed literary and mythological learning Nonnus is reminiscent of the Alexandrians. The influence of Nonnus can be detected in the small-scale epics on Trojan themes by Colluthus and Tryphiodorus.

Poetry, Lyric

“Lyric” is a term commonly used to describe a wide range of Greek poetry; it is in fact applied to most poetic forms, excluding stichic hexameters and drama. The word itself suggests a more precise meaning: it is derived from *lyra* (“lyre”), and this indicates that lyric poetry was originally performed to the accompaniment of a stringed instrument, its range later being broadened to include iambic and elegiac poetry. The modern usage of the word can be imprecise. Lyric poetry was not considered a literary genre until the Hellenistic period; in early texts we occasionally find the word *melos* (“song”), and so “melic” is a convenient modern term often employed to designate lyric proper, although this obscures the fact that elegy also was sung. Greek lyric comprises both solo song (often called monody) and choral poetry, although it is unlikely that ancient scholars made this distinction. Apart from the victory odes of Pindar, no early Greek lyric poetry survives in an independent manuscript tradition, so that we are forced to work with fragmentary texts, some of which are preserved on lacunose (mutilated) pieces of papyrus and others quoted by later authors. Complete poems are all but nonexistent. Still, despite such incomplete evidence, considerable variety can be discerned in the extant lyric texts. These poems are characterized by elaborate metrical patterns, often organized in strophes consisting of three or four lines, sometimes in larger units of corresponding strophe and antistrophe followed by an epode of a different metrical character.

The performance of song can be imagined as taking place in a variety of settings, the performers being no doubt either soloists or communal groups. In the celebrated scene in the *Iliad* Achilles may be giving such a performance when he sings “the glorious deeds of men” while accompanying himself on the lyre (9. 186ff.), although that passage has regularly been understood as referring to heroic song in the epic tradition (the songs of Demodocus in *Odyssey*, 8 are similar). The *Iliad* also mentions songs that are familiar from the later lyric tradition: the paeon, most familiar as a hymn to Apollo (1. 472–73,

22. 391), the *threnos* or formal lament (24. 720ff.), the *ailinos* or dirge (18. 570), and the *hymenaios* or wedding song (18. 493). These songs are all rooted in the religious traditions of Greek communities, and cult seems to have constituted one of the commonest settings for the performance of song, and, perhaps more important, the religious context seems to have influenced the character and development of principal lyric genres. This is not to say that song was confined to sacred occasions; doubtless it featured in many secular settings too. Brief fragments of soldiers' marching songs (*Poetae Milici Graeci*, edited Page, 1962, frs. 856 and 857) and songs sung at work (*PMG*, fr. 869) suggest that Greek life was alive with song – in fact, early Greek society has been characterized as a “song culture”.

Modern knowledge of Greek lyric begins in the 7th century BC, and the period from then down to the 5th century BC witnessed an extraordinary flowering of lyric; in fact, this period is often called the Lyric Age of Greece. It is sometimes said that lyric poetry was “invented” at this time, but there was clearly already a long tradition of popular song, and the preservation of poetry beginning in the 7th century BC no doubt coincides with the relatively recent introduction of writing and its use for recording poetry, a process that also brought about the preservation of the Homeric poems. These early lyric texts became the objects of considerable scholarly interest, first in the school of Aristotle, and later in the great library at Alexandria, where the texts of the central poets were edited and annotated. It is largely through the eyes of Hellenistic scholarship that we today view the fragmentary remains of the work of these poets, and we still make considerable use of that system of classification and categories, although it is clear that it imposed distinctions that obscure as well as clarify the issues. Perhaps the most pernicious is the rigid formal distinction between monody and choral song. Stesichorus and Pindar are classified as choral poets, and their surviving works have been seen to reflect a tradition of choral song that also stands behind the choral poetry of Greek drama; but recent discussion has challenged this view, and it now seems likely that this firm classification may be misleading, and that both monodic and choral performance were possible.

Working from the texts preserved in the library at Alexandria, scholars established a canon of nine lyric poets of the Archaic and Classical period. This list is avowedly selective, purporting to include only the finest exponents of lyric poetry, and we know incidentally of a number of lesser figures. Nevertheless the Alexandrian canon gives some impression of the character and range of the poetic activity in the early period. In chronological sequence, first comes Alcman, who was active in Sparta in the mid-7th century BC. He is best known from

an extensive papyrus fragment containing a portion of a long *partheneion* ("maiden song"), a genre for which the poet was well known, in which a chorus of nubile young girls sing a song that strikingly combines both traditional myth and self-presentation at a local religious festival. Much remains teasingly uncertain, and we are reminded of how closely bound much of early Greek poetry was to the occasion for which it was intended. Next we encounter Alcaeus and Sappho, who both composed monody on the island of Lesbos and represent what was clearly a distinctive Aeolic tradition of song. Alcaeus' poems seem to have been sung against the backdrop of the political factions in Mytilene at the close of the 7th century BC. Sappho lived during the same period, and the remains of her work afford a tantalizing glimpse into the private world of young women as they prepared for marriage. Stesichorus was born in Himera, in the western part of the Greek world. He seems to have been a contemporary of the Lesbian poets, but the fragments of his work betray little of his world; he composed large-scale lyric treatments of traditional myth, and his strongest affinities seem to be with the epic tradition. It has generally been assumed on formal grounds that Stesichorus' poetry was choral, but recent scholarship has increasingly been inclined to see these poems as the products of a tradition of solo song. Ibycus and Anacreon both seem to have moved in the world of the tyrants of the 6th century BC, and we can gain from the extant passages of their poetry an arresting impression of the aristocratic symposium. Simonides of Ceos, his kinsman Bacchylides, and the Theban Pindar are the great lyric voices of the Classical age; they composed in an impressive range of genres, but it is the surviving victory odes by Pindar and Bacchylides that give us the clearest picture of their art.

The latter part of the Classical period witnessed the decline of lyric poetry. The bold experiments of dithyrambic poets of the "new music" led to the subordination of poetry to music. In the Hellenistic period changes in social organization seem to have led to a severing of that important connection between occasion (especially religious festivals) and specific poetic forms. Once free of the need to produce the familiar forms for traditional occasions, poets were able to reconsider the established genres and give them new expression. During this period the epigram emerged as a remarkably flexible form, and quickly became the favoured medium of small-scale poetic expression. Lyric poems, however, continued to be composed, although many seem to have been prompted by special occasions and there is little impression of a continuous tradition of lyric song. From the imperial period little survives of importance. The *Anacreontea*, a collection of poems written after the manner of Anacreon, are variable in quality, but exerted considerable influence on western poetry. More interesting

is Hadrian's freedman, Mesomedes, who lived in the 2nd century AD. A collection of 13 poems survives in a manuscript tradition that also preserves musical notation for four of them; there are also two poems preserved in the *Palatine Anthology* (14. 63 and 16. 323). Mesomedes employed a number of metres and attempted to produce novel verbal effects and colouring in poems on a striking range of subjects.

Political History to 490_{BC}

Although a preoccupation with defining personal and collective relationships both within and between communities can be assumed to date back at least as far as the Neolithic period, the current state of knowledge makes it impossible to write a coherent political “prehistory” of Greece prior to the emergence of the polis (city state). While archives of Linear B tablets are now known from Mycenae, Tiryns, Midea, Thebes, Pylos, Knossos, and Chania, they are chiefly administrative records and inventories of commodities stored in the palaces; no texts have yet emerged that parallel the royal decrees and diplomatic documents of the Near East. What is known is that the Mycenaean palaces employed large workforces of specialized labourers (including slaves) dominated by an administrative hierarchy under a *wa-na-ka*, sometimes assisted by a *ra-wa-keta*. The Pylos tablets reveal that the “kingdom” of Pylos was divided into two provinces, governed by a *da-mo-ko-ro* and a *du-ma*, and that each province was further subdivided into districts under the authority of a *ko-re-te* who was assisted by a *po-ro-ko-re-te*. Nothing is recorded about the relationships that existed between palatial centres, though a recent tablet from Thebes appears to attest the presence of a Lacedaemonian.

Even less is known about the succeeding Dark Age due to the complete absence of literary material prior to the adoption of the Phoenician alphabet in the 8th century BC. Inferences for this period are largely based on archaeological investigation or analysis of institutional forms and social structures in the Homeric epics (though

there is considerable debate as to whether Homeric society is in any sense historical and, if so, whether it reflects the social and political conditions of the Dark Age, the 8th century, the 7th century, or an amalgam of each). Scholarly opinion is divided as to whether Dark Age society was predominantly hierarchical or egalitarian and whether the communities of this period were subject to individuals whose authority derived from personal charisma and social standing or – as the Homeric poems and later political theorists suggest – to hereditary monarchies. Consensus remains elusive, though recent interpretations of the archaeological evidence incline towards the view that Dark Age communities were not as small as previously assumed and may have been characterized by a weak form of ranking, though political leadership was probably an achieved rather than ascribed status.

The political history of Archaic Greece is essentially the history of the polis (plural: poleis), though in western Greece the prevailing form of organization was the *ethnos* – a large territorial entity characterized by scattered settlement and loose “federal” ties between communities, particularly in the religious and military domains. The word polis is conventionally translated as “city state” to indicate its dual status as both (1) an urban centre housing a single, unitary decision-making body whose authority extends over not only the settlement itself but also the surrounding territory (including second-order habitation sites) and (2) a community of citizens, fully enfranchised or not, who are entitled to own property within the territory of the polis and whose citizen status is predicated on either agnatic (patrilineal) descent from a citizen or a grant of citizenship from the central authority. While some possible continuities with features of the Mycenaean states cannot entirely be discounted and although poleis continued to be founded throughout the whole period of Greek antiquity, the crucial era for the formation of this type of organization would appear to be the 8th century BC. Archaeological evidence in particular indicates that this was a time of increasing settlement nucleation – perhaps accompanied by a more sedentary way of life and demographic increase which would itself necessitate a greater division of labour and specialization – as well as of a new preoccupation with defining territoriality through the foundation of sanctuaries in both urban settings and marginal rural areas.

The 8th century also witnessed the commencement of colonization of areas outside the Aegean and a symbiotic relationship has been posited between this and the emergence of the polis. The processes of social exclusion through which the polis was forged may have created a new group of outsiders who decided to form communities overseas, but the immediate imperatives of colonial foundation – settlement

planning, allotment of land, and procedures for decision making – probably exerted a feedback effect on the communities of the Greek mainland.

The rise of the polis should not be confused with the advent of democracy (the Athenian democracy hardly predates the reforms of Cleisthenes at the end of the 6th century BC, or in its more familiar “radical” form the measures undertaken by Ephialtes and Pericles in the middle of the 5th century) and ultimate authority in the poleis of the Archaic period invariably rested with the elite. The provisions of the Spartan “Great Rhetra” (conventionally – though not uncontroversially – dated to the mid-7th century BC) imply that deliberation and the right of veto lay with the two kings and their advisory council of 28 elders, drawn from the wealthier families, while the function of the popular assembly was merely to accede to the motions placed before it. A law from the temple of Apollo at Cretan Dreros, dated to 650–600 BC and stipulating that the office of kosmos could not be held by the same individual twice within a ten-year period, makes it clear that the function of early legislation was concerned less with defining rights and privileges within the citizen body as a whole than it was with regulating the distribution of power within the elite classes.

The word *demos*, which in democracies of the Classical period signified the entire citizen body, is in this period employed to denote those who are not of elite status, and the poetry of Hesiod, Theognis, and Solon testifies to a sharp division between elite and non-elite groups as well as to the growing importance of wealth (as opposed to birth) in recruitment to the governing classes. One of the many grievances which the *demos* held against the “bribe-devouring lords” who governed them (Hesiod, *Works and Days*, 38–39) appears to have been the fact that there was no clearcut dividing line between poor citizens and slaves: among the social problems that the Athenian statesman Solon had to address in the early 6th century BC was the practice whereby poorer citizens took out loans on the security of their person, risking enslavement in the event of default.

From the 7th century BC onwards certain members of the elite recognized that popular discontent could be mobilized for political ends and appealed to the *demos* for support against their rivals in establishing tyrannical regimes (the thesis that tyrannies emerged as a result of a sudden radical reorganization of military equipment and tactics – the so-called “hoplite reform” – is less religiously held today). The earliest tyrannies are attested in the area of the Corinthian isthmus: at Corinth itself Cypselus seized power c.655 BC; at about the same time Orthagoras gained control at Sicyon; and at Megara Theagenes established a tyranny c.640 BC. Towards the end of the 7th

century, tyrannies were established at Mytilene on the island of Lesbos and Miletus on the coast of Asia Minor and in the middle of the 6th century Polycrates seized power on the island of Samos. A tyranny is attributed to Pheidon at Argos, though dates for this enigmatic figure range from the 8th to the 6th century BC. About 630 BC Theagenes of Megara assisted his son-in-law Cylon in a coup at Athens, but the attempt was unsuccessful and Athens remained free from tyranny until c.546 BC when, on his third attempt, Pisistratus established himself as tyrant. The reason for Cylon's failure and Pisistratus' two failed attempts is probably that the vast and differentiated territory of Attica militated against any unified sentiments of collective consciousness among the Athenian demos (Pisistratus' eventual success was achieved through a mercenary force rather than the support of the demos). Popular support for tyrannical regimes was often shortlived as rival elite claimants also joined in courting the favour of the demos. Alternatively, elite factions might call upon outside help: the Spartan expulsion of Pisistratus' son Hippias in 510 BC was reputedly instigated by the wealthy Athenian family of the Alcmeonidae.

Relationships between poleis in the early Archaic period are characterized by the counteracting tendencies of aggregation and competition and conducted mainly at the level of the elite – the majority of citizens constituted a landbound peasantry whose horizons rarely exceeded the territorial limits of the polis, though specialist craftsmen, merchants, and mercenaries would often seek employment in other (Greek and non-Greek) cities. The elite classes maintained more cosmopolitan networks of support through guest friendships (*xenia*) and intermarriage (*epigamia*). This policy is demonstrated most clearly by the tyrants: guest friendships existed between Pisistratus and Lygdamis of Naxos (Herodotus, 1. 61), between Periander of Corinth and Thrasybulus of Miletus (Herodotus, 1. 2.0), and between Polycrates of Samos and Amasis, pharaoh of Egypt (Herodotus, 2. 182), while intermarriage guaranteed bonds of friendship between Periander and Procles of Epidaurus (Herodotus, 3. 50) and Theagenes and Cylon (Thucydides, 1. 126). The practice was not, however, limited to the tyrants alone: Isagoras, the Athenian archon (chief magistrate) for 508/07 BC, was a guest friend of the Spartan king Cleomenes (Herodotus, 5. 70); the Athenian Alcmeonidae contracted a guest friendship with King Croesus of Lydia (Herodotus, 6. 125); and among suitors from the most important families of Greece, it was the Alcmeonid Megacles who won the hand of Agariste, daughter of the Sicyonian tyrant Cleisthenes (Herodotus, 6. 130).

Aside from forging bonds of friendship, the elites also competed among themselves to win *kleos* (repute) and *kudos*. Archaeological evidence from Olympia indicates that the origins of the sanctuary date

back to the 10th or even 11th century BC, long before the formal institution of the Olympic Games (traditionally dated to 776 BC), and that the sanctuary originally served as an arena for competitive display through the dedication and circulation of prestige goods. Such conspicuous consumption served to assert an individual's status in the eyes of his peers as well as to guarantee his authority in his home community.

In the 6th century BC, however, elite habits came to be increasingly integrated within the more collective framework of the polis. The practice of contracting individual guest friendships was usurped and institutionalized at a civic level by appointing an official *proxenos* ("consul") in another city (a Locrian is already described as a *proxenos* of Corfu on a limestone cenotaph dated to 625–600 BC). New regulations regarding *epigamia* stipulated the communities into which one might marry, and the glory that individuals won in agonistic competitions at the Panhellenic sanctuaries of Olympia, Delphi, Isthmia, and Nemea was now redirected to reflect credit on the victor's polis. Cities, alongside individuals, vied with one another to dedicate expensive offerings and treasury buildings at the most important sanctuaries of Greece. These shared cult places provided a locus for the proclamation of common bonds between Greek cities, but it was those perceived commonalities that provided a defined framework for poleis to publicize not only their parity but also their distinct identities.

Warfare was simply a more violent manifestation of this agonistic spirit which employed shared rules and ritualized norms within which poleis might assert their independent identities. One of the earliest wars of which we hear is the Lelantine War fought between the neighbouring Euboean cities of Eretria and Chalcis, probably towards the beginning of the 7th century BC. Thucydides (1. 15) asserts that the rest of the Hellenic world participated in the conflict through alliances with one of the main protagonists, and isolated notices from Hesiod, Archilochus, Theognis, Herodotus, Plutarch, and Strabo have been ingeniously marshalled to draw a picture of a conflict between two massive trading leagues; in reality, however, it is far from clear that each of the sources refers to the same war and it is more likely that the story of an original conflict between two neighbouring cities was exaggerated over time by a tradition that cast the Lelantine War in similar terms to the Trojan War. Certainly wars in the Archaic period generally involved powerful neighbours – for instance, the mid-6th-century "Battle of the Fetters" between Sparta and Tegea (Herodotus, 1. 66) or the long-running dispute between Argos and Sparta over the Cynourian region of the Peloponnese, which may already have run intermittently for about a century by the time of the mid-6th century

when each side put forward 300 picked men to fight a “Battle of Champions” (Herodotus, 1. 82). Warfare in this period required the preselection of a time and place (generally a level plain) at which two armies of citizen hoplites (heavy infantry) confronted one another; in conforming to prescribed rules and rites both as preliminaries to the battle and in the conduct of the battle itself, hoplite armies played out a regulated (if lethal) game to determine which city was the victor.

Polis autonomy was also guaranteed within the leagues and amphictionies (“dwellers around”) that are said to have emerged during the Archaic period. Though its origins are hazy, one of the earliest is said to have been the amphictiony of central Greek states, organized around the sanctuary of Demeter at Anthela, which is thought to have been the predecessor of the Delphic Amphictiony charged with administering the sanctuary of Pythian Apollo. Strabo (8. 6. 14) refers to a Calaurian amphictiony, centred on the sanctuary of Poseidon on Calauria (modern Poros) and including the cities of Hermione, Epidaurus, Aegina, Athens, Prasiae, Nauplia, Orchomenus, and, later, Sparta and Argos, though there is no independent testimony for this amphictiony prior to the Hellenistic period. By the beginning of the 6th century, if not earlier, six Dorian cities in Asia Minor had organized themselves into a league (the Dorian Hexapolis) centred on the sanctuary of Apollo Triopios near Cnidus, while 12 Ionian cities constituted a similar federation (the Ionian Dodecapolis) focused on the sanctuary of Poseidon Heliconius at Mycale. Towards the end of the 6th century ^{BC} Sparta created a new hegemonic Peloponnesian league in which allies were required to follow wherever Sparta led by land or sea.

It is likely that an increase in the incidence of hostilities between poleis, together with the need to field larger citizen armies, contributed to growing calls for a broader base of political inclusion. An inscription from the island of Chios attests to a “popular council” (as opposed to an aristocratic council) by 575–550 ^{BC}, and a few decades earlier the Athenian Solon is said to have established a new probouleutic council (*boule*) of 400 which coexisted with the aristocratic council of the Areopagus, though it is unclear exactly how powerful this council was prior to its reconstitution as the Council of 500 under Cleisthenes in the last decade of the 6th century and the reorganization of the Areopagus under Ephialtes in the 460s. Solon also established the right of appeal to popular jury courts and formalized the admission of the lowest property class of Athenian citizens (the *thetes*) to the popular assembly, though the aristocracy continued to exert considerable influence – particularly in rural areas – until Cleisthenes engineered a radical reorganization of the citizen body into demes distributed among ten new tribes.

The rise of Lydia and especially Persia in the 6th century BC had profound consequences for the cities of eastern Greece. By 546 the cities of Colophon, Magnesia, Smyrna, and Ephesus had fallen to the Lydians, and following the defeat of Croesus of Lydia the Greek cities of Asia Minor became the possession of the Persian king Cyrus the Great. In about 520 Cyrus' successor Darius I assessed the cities for tribute within the new satrapies that he had established and launched attacks on the islands of the Aegean as well as advancing into Thrace, where he accepted the submission of the Macedonian king Amyntas c.500 BC. In 499 the Ionians initiated their ill-fated revolt from Persian dominion, and Herodotus (5. 97) argues that it was the support afforded the Ionian rebels by Athens and Eretria on this occasion that provoked Darius' successful assault of Eretria and unsuccessful landing at Marathon in 490. The Athenian victory against overwhelming forces at Marathon served as a key founding-myth of Athenian identity throughout the 5th and 4th centuries BC.

Political History 490–323_{BC}

The immediate effect of the Athenian victory at Marathon was to prompt Darius' son Xerxes to launch a new and greater invasion in 480_{BC}. His force, incorporating various Greek contingents including the Thebans, was repulsed by the Greeks, under the hegemony of the Spartans but without the Argives, in the battles of Artemisium, Salamis (both 480), Plataea, and Mycale (both 479). These victories, and the glorious defeat at Thermopylae (where the fighting on land coincided with the naval battle at Artemisium), were of utmost importance in the fostering of Greek self-belief and were commemorated in verse, prose, art, and architecture for centuries afterwards. But they are also indicative of two of the major themes of Greek history in the 5th and 4th centuries bc: the persistent external threat posed to the Greeks by the Persian empire, and the constant internal, interstate rivalries which served to undermine Greek political stability.

Athens was the first state to assert this new-found confidence, when the Spartans withdrew from the command of the Greek forces in 487. The Spartan king Pausanias captured Byzantium, but his arrogant behaviour led to his recall to Sparta. A new alliance was formed, comprising the Ionian states, most of the Aegean islands, and cities of the Hellespont and Propontis regions, with a base on Apollo's island of Delos (hence the modern tide "Delian League") and under the leadership of Athens, which claimed to be the Ionians' mother city. Delos housed the treasury of the league, to which most of the members paid an annual tribute (others, most notably Chios, Lesbos, and Samos, provided ships). The history of the *pentekontaetia* (roughly the 50-year period 480–430_{BC}) is dominated by the Athenians' increasing hold on the Delian League and its transformation into an Athenian empire, and the largely ineffectual opposition to Athens by the Spartans and their allies (loosely termed the Peloponnesian League). Although the early campaigns of the league were aimed at dislodging the Persians from western Asia Minor, culminating in the Athenian general Cimon's victory at the river Eurymedon (466), almost from the start Athenian ambitions were barely disguised. Cimon's coercion of Skyros (c.475) was followed by that of Carystus in Euboea (c.472), Naxos was forcibly prevented from seceding (c.467), and Thasos was harshly dealt with after revolting in protest against Athenian interference in Thasos' mainland possessions (465). Athenian confidence was further fuelled by the development of the democracy. Cleisthenes' democratic reforms of 508/07_{BC} were buttressed by the rising importance of the board of ten elected generals at the expense

of the archons, and by the reforms of Ephialtes in 462, in which the powers of the Areopagus were divided between the assembly, the council, and the law courts. Soon after, Pericles introduced pay for the jurors and members of the council, and in 451 he passed a law which restricted citizenship to those who were the legitimate sons of an Athenian mother as well as father.

The Spartans, meanwhile, were unable to check the expansion of Athens. Although the threat of Argos, Sparta's main rival in the Peloponnese, had been crushed in 494, internal problems with the Arcadians were followed by a serious helot revolt after an earthquake c.465. Cimon led a force of Athenians to assist the Spartans, but in his absence Ephialtes passed his reforms and Cimon was dismissed. After subduing the revolt, Sparta finally took action to secure its interests in central Greece, but Athens' main opponents during the First Peloponnesian War (c.461–446) were the Corinthians. Corinthian aggression led Megara to leave the Peloponnesian League and side with Athens, and Corinth suffered heavy losses in the early stages of the war. Athenian power now reached its peak in Greece and the Aegean under the leadership of Pericles: Aegina was forced into the league (458), and after an initial defeat at Tanagra had been reversed at Oenophyta, Boeotia came under Athenian control (457–446). The Athenians were confident enough to pursue war on two fronts, dispatching an expedition to Cyprus in 460 which was sent on to Egypt to support Inarus' revolt against Persia, but this force was destroyed in 454. The league treasury was subsequently transferred from Delos to Athens, and the Peace of Callias was concluded with the Persians in 450, ending open hostilities until 413 (it is not quite certain that a formal peace was made). Back in Greece, the war ended in 446 as Boeotia revolted and the Athenians were defeated at Coronea. Megara returned to the Spartan fold and was used as the base for a Spartan invasion of Attica, and Euboea also rebelled. The Thirty Years' Peace was concluded, by which Athens lost control of Boeotia (whose major cities formed the Boeotian Confederacy) and other recent acquisitions, and which satisfied the Corinthians, who prevented Peloponnesian intervention against the Athenians when Samos revolted in 440. The peace held until 431, despite continued Athenian expansionism (e.g. the establishment in 437–436 of the strategically important colony of Amphipolis on the east bank of the river Strymon) and increasing oppression of the allies, especially by means of cleruchies (settlements on conquered territory). But in Thucydides' view war was inevitable, and in his opinion Spartan fear of the growth of Athenian power was the truest cause of the outbreak of the main Peloponnesian War (431–404). It was precipitated by a series of grievances among Sparta's allies, including the Athenian

alliance with Corfu against Corinth (433), the Megarian Decree (? 432), which restricted access to the Athenian agora and to harbours of the Athenian empire, and Aeginetan complaints that their autonomy under the terms of the peace had been infringed. The Spartans and the Peloponnesians now attempted to liberate Greece from Athenian domination, but the first ten years (the Archidamian War) resulted in stalemate and the Peace of Nicias (421). On the resumption of hostilities Athens suffered various setbacks, including the disastrous failure of the great expedition to Sicily (415–413), the subsequent secessions of Chios, Miletus, Thasos, and Euboea, the renewal of Persian interference in Greek affairs (413) and their commitment to the Spartans (407), and the temporary overthrow of the democracy by the oligarchy of the Four Hundred (411). Nevertheless, the fighting continued (the Ionian War) with some notable Athenian successes until they were finally defeated at Aegospotami (405). Persian money was no small influence here. The city itself fell in 404, and the Spartans installed the shortlived and hated regime of the Thirty Tyrants (404–403).

Sparta's victory in the Peloponnesian War, far from curtailing hostilities, was only the beginning of a series of struggles in the 4th century, as various states in turn asserted their claim to supremacy and were overthrown. The victorious Spartan general, Lysander, quickly made himself and his country unpopular with his policy of establishing oligarchic decarchies in numerous cities, and fear of Sparta's expansionist policies in Asia Minor, central and northern Greece, and the west led to the Corinthian War (395–386). Athens, with a restored but less radical democracy, had recovered remarkably from defeat and now joined in an anti-Spartan alliance with Thebes (which had gained control of the Boeotian Confederacy during the Peloponnesian War, but had fallen out with Sparta and received Athenian democratic exiles during the rule of the tyrants), Corinth (whose relations with Sparta had also deteriorated in 404 when the Spartans refused to destroy the defeated Athens), Argos (Sparta's old enemy), and Persia (reversing the former alliance). The Athenian Conon led a Persian-sponsored fleet to victory at Cnidus (394), but despite much fighting around Corinth the allies were unable to inflict a fatal reverse on the Spartans and the war was ended by the King's Peace. This treaty, negotiated by the Spartan Antalcidas and imposed by King Artaxerxes II, guaranteed the Greeks' autonomy, but in exchange for Persian control of the cities of Asia, Clazomenae, and Cyprus. The peace had the additional effect of strengthening Sparta's position in central and northern Greece, enabling the coercion of Olynthus and dissolution of the Chalcidian Confederacy. The Boeotian Confederacy was also dismantled, but the Spartans, whose king

Agasilaus II was implacably hostile to Thebes, went too far in occupying the Theban acropolis, the Cadmea (382), which the Athenians helped liberate in 379. Thebes subsequently joined the Second Athenian Confederacy (378), which was formed to ensure the Spartans' compliance with the terms of the King's Peace. Athens was careful not to repeat the mistakes of the 5th-century empire, guaranteeing no internal political interference or tribute, and membership grew rapidly in the period 378–373. But so too did Theban power, as it re-established the Boeotian Confederacy under Theban control, and the Spartans' military dominance was ended for good at the Battle of Leuctra (371). A decline in the number of full Spartan citizens (*homoioi*) had set in during the 5th century, as changes in the pattern of landholding deprived many Spartans of the ability to contribute to the common messes on which their citizenship depended. Now Athens and Sparta were forced to forget past differences and unite in opposition to Thebes, which tried to supplant Athens at sea and to undermine Sparta's position in the Peloponnese by the foundation of Megalopolis in Arcadia (c.370–367) and Messene in Messenia (369). While the Peloponnesian League finally collapsed (366), the Thebans, led by Epaminondas and Pelopidas, enjoyed a brief period of hegemony, which ended with Epaminondas' death at the Battle of Mantinea (362).

One other major player in the 370s was Jason, the tyrant of Pherae in Thessaly, who made an alliance with Thebes after 375, captured Pharsalus (375/4), and became *tagos* (supreme magistrate of Thessaly). His unification of Thessaly provoked Phocis (373–371), but he went on to gain control of Perrhaebia and was planning a Persian invasion when he was assassinated (370).

Athens, meanwhile, was beginning to return to its old ways. Attempts to recover Amphipolis (from 368), which had surrendered to the Spartan general Brasidas in 424 and had since remained independent, the installation of cleruchies, especially that in Samos (366), and increasing political and judicial interference in confederate states made the Second Athenian Confederacy unpopular; and eventually Byzantium, Chios, and Rhodes rebelled in the Social War (357–355). Athens and Sparta also became involved in the Third Sacred War, backing Phocis against the Delphic amphictiony (355). All the time a new threat to Greek independence was growing, as Philip II of Macedon (ruled 359–336) first consolidated his position and then began expanding his kingdom. Amphipolis was captured in 357 while Athens was involved in the Social War, other northern Greek states were annexed, and Philip secured Thessaly in 352. Athens finally began to wake up to the threat, and opposition to Philip was promoted by Demosthenes. It was too late, however, to save Olynthus

(349–348), and without Greek support the Athenians were forced to negotiate the Peace of Philocrates (346). Before ratifying the treaty Philip accepted the invitation of the Delphic amphictiony to lead resistance to Phocis, which was destroyed. Further expansion in Illyria and Thrace, and the besieging of Perinthus and Byzantium, delayed the final attack on Greece, which culminated in the destruction of the Theban, Corinthian, and Athenian forces at Chaeronea (338). This was the end of Greek political independence: the League of Corinth was formed the next summer (337) with a common peace which provided for the autonomy of member states, prohibited constitutional change, and put Philip at the head of the governing council (*synedrion*). At the foundation meeting Philip announced his plan to invade Persia, but he was assassinated before he could carry it out (336).

Philip's successor was Alexander III the Great, who accomplished his father's plan in a series of brilliant campaigns (334–323). Before departing on his great expedition Alexander made a show of strength in southern Greece, and when Thebes revolted during Alexander's campaign on the Danube, he returned to destroy the city and enslave its inhabitants (335). Alexander left Greece under the control of Antipater, who crushed a Spartan rebellion led by Agis III, supported by Elis, Tegea, and the Achaean Confederacy (331). Athens refused to support Agis and remained subdued in the 330s and 320s, its leading politician being Lysicrates. He was responsible for reestablishing the city's finances, increasing the navy, and a rebuilding programme, which included an arsenal, docks, and the theatre of Dionysus. Alexander's death sparked the struggles of the successors and in the Greek sphere the Lamian War (323–322), in which a coalition led by the Athenians and Aetolians was almost successful. But the crushing defeat at Crannon resulted in the suppression of the Athenian democracy by Antipater, which was temporarily restored in 318 by Polyperchon before the tyrannical rule of Demetrius of Phalerum (318–307).

The momentous struggles of mainland and eastern Greece in the 5th and 4th centuries should not be allowed to overshadow the events in the western Greek world, in Sicily and southern Italy. Here too the Greek communities faced the double threat of external powers and internal rivalries. Those in Italy had local, indigenous rivals (e.g. the Messapians massacred the Greek Tarentines c.470), as well as the major power of the Etruscans; while those in Sicily faced the threat of the Carthaginians. The main western Greek state was Syracuse, whose power rose greatly under Gelon, the tyrant of Gela, who seized Syracuse in 485 (his brother Hieron becoming tyrant of Gela). He was prevented from helping the mainland Greeks in 480 by the Carthaginian Hamilcar's invasion of Sicily, but won a crushing victory

at Himera. Gelon was succeeded in 478/77 by Hieron, who defeated the Etruscans in a naval battle with the help of Cumae (474). Democracy was restored after Hieron's death (466), but Syracuse became involved in wars with another leading Sicilian state, Acragas, and with the Sicels, who under Ducetius defeated the joint forces of Syracuse and Acragas in 451. Ducetius himself was in turn defeated by the Syracusans in 450 and exiled, but returned to found the colony of Caleacte, which resulted in another war between Syracuse and Acragas. Syracusan victory was later followed by successes against Athens (427–424, 415–413), but further interference by the Carthaginians resulted in the destruction of Himera and other cities (409). The democracy was overthrown in 406 by Dionysius I, who fought four wars against the Carthaginians and extended Syracusan power over most of Sicily and much of southern Italy. He died in 367 and his successor, his eldest son Dionysius II, was opposed by Dion (356) in a civil war which was ended by the intervention of the Corinthian Timoleon on behalf of exiled opponents of Dionysius. Timoleon put down tyranny in Sicily, defeated the Carthaginians (341), and re-established stable government, but after his retirement (c.336) an oligarchic government was installed until Agathocles became tyrant (317) and once again subdued most of Sicily.

Political History 323–31_{BC}

The chaos resulting from the unexpected death of Alexander III the Great in Babylon in 323_{BC} lasted for several decades before the establishment of the three major Hellenistic Greek kingdoms which form the focus of the history of the next three centuries. The kingship fell jointly to the son and half-brother of Alexander, the satrapal appointments were rearranged, and the successors (the name traditionally used for Alexander's generals) fought each other and jockeyed for positions of ever greater power. Some were killed early on in this power struggle, and successive regents of the two kings died. The kings were returned to mainland Greece (which in effect signalled the end of Alexander's Asian empire) where they became pawns in the hands of those seeking to establish mastery over Macedonia and Greece, and the remaining successors continued to fight each other in Asia Minor.

It was probably inevitable that both kings would be murdered, as also were eventually all the immediate members of Alexander the Great's family, thereby extinguishing the Argead dynasty of kings of Macedonia (to which Alexander and his father Philip II belonged). In 306–305_{BC} the surviving successors assumed the title of "king", thus acknowledging finally that Alexander's kingdom was now split among several rulers even if they did not yet have fixed geographical kingdoms. A major landmark of this period was the Battle of Ipsus (in Phrygia) in 301_{BC}, in which the Macedonian general Antigonos the One-Eyed was defeated and killed by a coalition of the other successors, who divided the spoils of the territories he controlled among themselves.

Antigonos' ambitious son Demetrius (known as Poliorcetes, "the Besieger", because of his siege of Rhodes in 305/04_{BC}) unsuccessfully tried to re-establish his father's Asian empire while also intervening in Greece. It was only when his son Antigonos Gonatas securely established himself on the throne of Macedon in 277/76_{BC} that the Antigonid dynasty of kings of Macedon was created.

Third-century Macedonian history is characterized by warfare on the northwestern borders with Illyria and by attempts to control mainland Greece by both diplomacy and guile. Judging from the low

numbers of Macedonian troops recorded in various encounters, it appears that the country suffered the effects of severe depopulation as a result of Alexander the Great's removal of some 40,000 men in their prime in the 4th century BC. Finally, in 229 BC, the accession to the throne of the boy king Philip V under the care of a regent left the country potentially vulnerable. When he assumed control in his own name in 221, Philip unwisely thought that he could prevail against the growing power of Rome, whose suspicions about Greece were becoming ever stronger. Three Macedonian Wars were fought, leading to Philip's defeat at Cynoscephalae in 197, and to his son Perseus' even more catastrophic defeat at Pydna in 168. After Pydna, Macedonia was ruthlessly sacked and the kingship abolished. The region became a full province of Rome in 146 BC.

Mainland Greece suffered various vicissitudes during this period. Athens, usually under Macedonian control, was constantly split between pro- and anti-Macedonian factions and experienced severe internal political stasis. A major revolt against Macedonia is attested in 287 BC, and the Chremonidean War in the 260s signalled the final unsuccessful attempt of Athens (this time allied to Sparta) to overthrow the Macedonian yoke. A Macedonian garrison was imposed, Macedonian officers were installed in Athenian political posts, and the activity of the Assembly was curtailed. This was a severe humiliation to a city which was the birthplace of Greek democracy. Athens became politically unimportant after this period, but remained culturally pre-eminent, even if eclipsed by the new Greek city Alexandria in Egypt. During the next centuries many notable figures of both Greek and Roman origin came to study in Athenian philosophical and rhetorical schools.

During this period politics in the Peloponnese revolved around the Achaean League (a powerful federation of Peloponnesian cities), a stubbornly independent Sparta, the interference of both Macedonia and Rome, and the attempts of the league to manipulate all parties to its advantage. Despite some flirtations with social and economic reform in the 3rd century, Sparta was finally forcibly united with the Achaean League in 192 BC, which was in turn defeated by Rome in 146 BC. The Greek city of Corinth was sacked with a savagery which shocked the Greek world. The region was first incorporated into the Roman province of Macedonia but became the separate province of Achaia under the Roman empire.

Events in mainland Greece in the Hellenistic period arguably take second place to events in the new Greek kingdoms established in Asia after the wars of the successors. Ptolemy, a Macedonian general of Alexander the Great, received the satrapy of Egypt after Alexander's death and developed it into a wealthy and powerful kingdom to be

ruled by himself and his descendants. Being content with Egypt, Ptolemy wisely avoided any temptation to extend his territory at the expense of the other successors, but he displayed a defensive strategy by establishing control over nearby Cyprus and Cyrenaica (a large region in modern Libya). His capital was the coastal city of Alexandria in the north of the Nile delta, founded by Alexander during his visit to Egypt in 331 BC. Alexandria – superbly situated for east–west trade – quickly became the jewel of the Mediterranean, taking over from Athens in cultural terms, and grew into a great city as a result of encouraged immigration from the rest of the Greek world.

Third-century Ptolemaic Egypt is characterized by good kings, relatively stable government, and enormous prosperity. Although there were brief interventions in mainland Greece, Egypt's major foreign problem was an ongoing dispute with the Seleucids (see below) over the area called Coele (in Greek “Hollow”) Syria, the region comprising much of the modern Middle East. A series of Syrian wars were fought during the 3rd and 2nd centuries BC, with varying outcomes. By the middle of the 3rd century Ptolemy II had developed the largest and most powerful naval fleet ever known in the ancient Greek world (although the navy did experience a few defeats in battle), and Egypt became the protector of the Mediterranean, securing the safety of trade and travel against the threat of pirates. At the end of the 3rd century the kingdom was shaken by a native revolt in which Nubia (southern Egypt) seceded for a time.

In the 2nd century the growing interest of Rome in eastern Greek politics was combined with weak Ptolemaic kings and continued Syrian wars. The Ptolemaic habit of brother–sister marriage led to even worse cases of incest, resulting in several multiply interrelated claimants to the throne at various periods. Rivals were murdered, princesses were married off to foreign kings to seal temporary alliances, and the support of Syria and Rome was sought by different factions. The last Ptolemaic queen was Cleopatra VII, descended from an illegitimate royal line. Julius Caesar came to Egypt in the mid-1st century BC in the course of his war with Pompey the Great, and fought on Cleopatra's behalf a war against her brother-husband (the so-called “Alexandrian War”). Their love affair resulted in the birth of a son. Cleopatra turned to Mark Antony after Caesar's assassination, and their even more famous love affair ended with a naval defeat at the Battle of Actium in 31 BC at the hands of Octavian (later the emperor Augustus). Both committed suicide, the Ptolemaic dynasty ended, and Greek Egypt became a province of Rome.

The Seleucid empire was established by Seleucus, a Macedonian general of Alexander the Great who had received the satrapy of Babylon during the various divisions of Alexander's empire. He was

eventually confirmed as ruler also of the territories east of the Euphrates – the huge Asian empire of Alexander which included modern Iran, Iraq, Afghanistan, and Pakistan as far as India. Seleucid control over much of this vast territory was nominal, with several royal expeditions during the next three centuries in not always successful attempts to reconquer or pacify various regions. After the battle of Ipsus in 301 Seleucus received the area of greater Syria (the northern part of the Middle East, not to be confused with the boundaries of the modern state of Syria), and this became the heartland of his empire, now with an outlet to the Mediterranean. A new capital city was founded at Antioch on the Orontes river (the city of Antakya in modern Turkey), with a seaport on the coast at Seleuceia in Pieria. Antioch became one of the greatest and most important Greek cities of later antiquity. Seleucus also encouraged Greeks from all over the Mediterranean to inhabit his kingdom, and the early Seleucid kings were enthusiastic city founders, founding several cities throughout their empire in which Greek urban lifestyle, institutions, culture, and language were established and continued for centuries.

During the 3rd and 2nd centuries the Seleucids fought several wars against the Ptolemies for the control of adjoining Coele Syria (see above), and suffered dynastic disputes and revolts by brothers, cousins, and eastern satraps. Expansion into Asia Minor came up against the growing power of the Attalid kingdom of Pergamum, and in the 2nd century Rome's unfavourable attention focused on king Antiochus III the Great because of his troublemaking alliances with other Hellenistic kings and forays into mainland Greece. In 191 BC Roman forces defeated Antiochus at the Thermopylae pass in central Greece (the site of the famous battle of the Persian War in the 5th century BC). He refused harsh Roman demands and an ultimatum that he withdraw to Syria. Risking all in battle, he was decisively defeated by a Roman army at the Battle of Magnesia in 189 BC. The resulting Peace of Apamea in 188 meant that the Seleucid empire was no longer a Mediterranean power, and successful revolts in the eastern territories decreased the extent of its influence.

Later Seleucid history is dominated by catastrophic dynastic disputes and the rise of pretenders to the throne which led to constant civil wars (much of the conflict was aided and abetted by Ptolemaic kings who intervened in devious ways in order to weaken their main rivals). The situation deteriorated to the extent that the Syrian people offered the throne to the king of Armenia in 83 BC. After appealing to Rome, the last Seleucid king, Antiochus XIII, was temporarily restored to the throne in Antioch under Roman protection in 69 BC, but in 64 BC Syria was made a Roman province.

The rise of the kingdom of Pergamum also lies in the age of Alexander's successors. Philetaerus, of mixed Macedonian and Paphlagonian background, is first seen in the entourage of Antigonos the One-Eyed, then in that of Lysimachus of Thrace, and finally in that of Seleucus I. He had been put in charge of the stronghold of Pergamum, a city in northwest Asia Minor (now Bergama in modern Turkey), as well as a substantial treasury. The descendants of Philetaerus gradually established their independence from the Seleucids, and deprived the Seleucid empire of large areas of Asia Minor by cunningly intervening in Seleucid civil wars. Attalus (after whom the Attalid kingdom of Pergamum is named) was the first ruler to take the title of king in the late 230s BC, as a result of his military victories over Celtic mercenaries (called Galatians) in Seleucid employ. By means of lavish sculpted dedications, Attalus depicted his victories as important achievements, and himself as the champion of Greek freedom against a renewed barbarian threat. The Attalids early on were allies of Rome against Philip V of Macedon, and established the beginnings of an overseas empire in the Greek islands of Aegina, Andros, and Euboea.

Attalus I's sons continued as Rome's allies against various Greek foes, and Pergamum was rewarded with vast grants of territory in the reassignment of territory in the Peace of Apamea in 188 BC. After the Galatians were finally decisively defeated, Pergamum became the most powerful kingdom in Asia Minor, and extensive building operations on the acropolis transformed Pergamum into a magnificent Greek city. A library of Greek literature rivalled those of Athens and Alexandria (some scholars say that parchment, called in Greek *pergamena* after the city, was invented there to remove dependence on Egyptian papyrus), and monuments proclaiming in mythological terms the Attalids as the defenders of Hellenism and civilization against barbarism were erected. These are among the greatest creations of Hellenistic art. In order to reinforce their place in the Hellenic world, the Attalids also dedicated lavish buildings at Delos, Delphi, and Athens (the stoa of Attalus II in the Athenian Agora is a famous example of their beneficence towards Greek cities).

The Attalid dynasty came to an end in 133 BC upon the death of its last king, Attalus III, who for uncertain reasons bequeathed his kingdom to Rome, thereby giving Rome a free rein to intervene in Greek Asia Minor.

During the Hellenistic period the Greek cities of Asia Minor and the islands suffered different fates under the shifting control of various Hellenistic monarchs. The Dodecanesian island of Rhodes maintained its democratic independence for some time despite attempts by the kings to control it, and it gained a position of considerable power and

prestige in the Greek world at this period. Its position on the east–west trade routes and the facilities provided by five harbours in the capital guaranteed considerable economic prosperity. Bravely resisting a year-long siege by Demetrius Poliorcetes against immense odds in 305/04 BC, Rhodes built up its navy and gradually replaced the Ptolemies as protector of Greek cities in the Aegean against marauding pirates. Friendship with Rome ensured rewards for Rhodes in the Peace of Apamea in 188 BC, and it was granted extensive territory on the mainland of Asia Minor. The democratic system of government on Rhodes allowed for the development of anti-Roman factions, however, and Rhodes was punished for its support of Macedonia in the Third Macedonian War. It was forced into an unequal alliance with Rome in 164 BC, and thereafter ceased to be an independent political power, although it remained a prosperous and highly cultured city.

The Hellenistic age saw the expansion of Greeks and the Greek way of life into Asia Minor, the Middle East, Egypt, Iraq, Iran, Afghanistan, and Pakistan as far as India. Some settlements were not as successful and long-lasting as others, depending upon the fortunes of the Hellenistic empires, but Greeks and the Greek language lasted in these areas throughout the Roman empire until it phased into the world of Byzantine Greece. It could be maintained that the Hellenistic period had a more cosmopolitan Greek culture than that of the parochial city-states in the Classical period. Unfortunately, the Greek world was ultimately unable to resist the power of Rome in political terms, but, far from extinguishing Greek culture, Rome itself became captivated by Greek scholarship, philosophy, and literature.

Political History 31 BC–AD 330

Many discussions of the history of Roman Greece begin with the famous line from Horace: “Graecia capta ferum victorem cepit” (“Greece, the captive, took her savage victor captive”, *Epistulae*, 2. 1.

156). It is true that Greek ideals and language captured and dominated the eastern Mediterranean world, but politically Greece became part of the Roman sphere of influence long before the triumphs of Augustus and the poems of Horace. As early as 229 BC the Romans had established protectorates over Greek towns, such as Corcyra, Apollonia, Dyrrachium, and Issa, and in the mid-2nd century BC the Romans arrived to stay in the eastern Mediterranean region. In 146 BC the Romans, led by L. Mummius, destroyed the Achaeans near Corinth. Corinth was razed, its treasures were shipped to Rome, men were massacred, and other inhabitants were sold into slavery. The Achaean League was dissolved, and Greece ultimately became the site of much bitter Roman warfare throughout the 1st century BC. The Civil Wars brought Pompey and Caesar and then Octavian and Mark Antony to Greece, where the combatants depended upon men and material aid from the Greeks, putting significant psychological and economic burdens on the population.

Once the east was conquered, the Romans needed to manage their new territories. The organization of political control in Greece was complicated by Roman respect for Greek culture and traditions, so that the province's administrative status underwent several changes throughout the centuries of Roman rule. Shortly after the Battle of Actium (31 BC) Octavian created the new province of Achaea (roughly the area of modern Greece without Crete, Macedonia, and Thessaly). The idea of a unified Greece rather than politically independent city states took root in this era, even though parts of what we now consider Greece remained separate. Epirus was eventually (though temporarily) made into a separate province as well. The province of Achaea was at first under the control of the Senate (i.e. "proconsular"), but both Achaea and Macedonia were, according to Tacitus (*Annales*, 1. 76), officially turned over to the emperor in AD 15. After AD 44 "proconsul" and "praeses" are both used to describe the governor of Achaea, and the province seems to have, de facto, reverted to proconsular role. The Greeks briefly enjoyed some independence under a grant from Nero. At the Isthmian Games in AD 66/67 he declared Achaea free, though this status was overturned by Vespasian only a few years later. Achaea was formally made proconsular again in either Diocletian's or, more likely, Constantine's reign, after which the governors of Achaea are known only as proconsuls or consuls until they disappear from the record in the 5th century AD.

After the conquest the Hellenistic leagues endured (at least 12 are known), but they were of little bureaucratic importance. Instead, the Greek provinces were ruled through their well-established cities where small groups of local elites played important roles as Roman managers

and representatives, and ran the day-to-day provincial business. Among the most important duties of the cities and their managers was the collection of imperial revenues. It was likely that as early as the reign of Augustus (as Octavian was styled from 27 BC onwards) regular taxation was levied. Both a “head tax” (*tributum capitis*) and a “land tax” (*tributum soli*) are attested under the Principate. Other levies included customs and port taxes, sales taxes, and special levies in times of need. Though statistically relatively low (probably less than 10 per cent), taxation was despised by the provincials and felt to be oppressive, and may well have been devastating to subsistence farmers and other poorer provincials. Not all cities, however, were subject to regular taxation and control by the provincial governor. Pliny (*Epistles*, 8. 24. 2–3) states that the cities most revered for their Classical history were granted freedom and immunity from levies (these included Amphissa, Athens, Corinth, Delphi, Elateia, Pallanteion, and Sparta). But even these cities were sometimes asked to provide contributions from a sense of “friendliness” to the Romans. Strabo (*Geography*, 8. 5. 5) notes that the Spartans “were held in particular honour, and remained free, contributing to Rome nothing else but friendly services [*philikon leitourgion*]”. Of particular importance to the economic health of Greece, however, is the crucial fact that, whether regular or sporadic, resources were drained away from Greece into the coffers of the larger empire.

In addition to any economic burdens, the Greeks experienced a mixed blessing from their location at the centre of the empire. Technically, Achaëa was an unarmed province with little military presence, so the influence of the empire may often have been a degree less obvious and oppressive in Greece than on the frontiers. Only small contingents of soldiers, rather than significant garrisons, were found in the territory during the early empire. On the other hand, the economic stimulation that the frontier provinces experienced was missing in Greece, where insulation brought a measure of economic stagnation.

For the most part Greek citizens and cities were unmolested and enjoyed the fruits of the *pax Romana*, but there were examples of violent strategies in the imposition of early imperial control. The arrival of the Romans sometimes meant territorial and demographic manipulation. Particularly in the early years of Roman control under Caesar and Augustus, land was taken and redistributed to show pleasure or displeasure with one city over another. These were considered the rights of the victor over the vanquished. Cities and colonies were founded at will. Corinth, for example, was rebuilt, colonized, and grew under the support of Caesar and then Augustus. Augustus also founded Nicopolis in Epirus, and Dium and Cassandreia

in Macedonia, while Caesar was known to have created the city of Patras in Achaea and possibly Dyme nearby. Augustus not only manipulated territories, he moved people. Men were transferred, for instance, into Patras where the emperor “united them with the Achaeans also from Rhyope, which town he razed to the ground” (Pausanias, 7. 18. 7).

Recent archaeological and historical work supports ancient claims, such as those of Pausanias, that there was significant movement of populations and realignment of states under the emperors. Results from archaeological survey in Aetolia show a clear pattern of site abandonment in the Roman era which reflects the claims of Pausanias (7. 18. 8–9) that the province was “laid waste” by the emperor Augustus. Epirus, too, was depopulated – so much so that Strabo claims all remaining Epirots in Augustus’ time would fit into a single city (7. 7. 6).

Over the course of the 1st and 2nd centuries AD in Greece, as elsewhere, there was a trend towards larger, but fewer, administrative centres such as Corinth, where the provincial governor and his staff were based. Corinth itself did not formally control other Achaean cities, or even mediate between them and the Romans, but it did show a particularly close connection to Rome. Corinthian coinage was modelled on Roman, its pottery showed clear western influences, and Corinth was the site of one the earliest overseas capitolia (though its precise location is still disputed). Clear benefits of empire also accrued to regions outside Corinth. As is well known, one way to emphasize one’s political power and prestige was through patronage. The emperor Augustus began a long-imitated trend when he made Greece the beneficiary of such largesse. He continued to rebuild Corinth, which probably became the provincial capital at that time (and which remained Latin-speaking until the reign of Hadrian). Roman Messenia also shows signs of growing prosperity with the coming of empire. Pausanias (4. 31. 5–33. 2) lists numerous Roman-period structures, both civic and religious, which testify to an affluent way of life.

Many Roman emperors evinced a personal interest in Greek culture and history (sometimes, of course, this meant despoiling Greece of its art and antiquities). Nero, for example, was a devoted philhellene. He spoke Greek, attempted to cut a channel through the isthmus of Corinth (to improve communications and trade routes), became an Athenian archon, and was initiated into the mysteries of Demeter. Imperial dedications to Greece could be substantial, including buildings, roads, and other physical manifestations of their concern for Achaea and their own prestige. Trajan had built the Library of Pantaenus in Athens. Hadrian supported numerous projects including buildings at Delphi, many structures in Athens – creating a “New

Athens” in the process – as well as stoas, temples, aqueducts, bridges, and baths throughout Achaëa. In AD 131/32 Hadrian founded the “Panhellenion”, a largely cultural organization of Greek cities (from Greece, Asia Minor, and north Africa) centred in Athens. The respect for Greek culture supported by the creation of this organization lasted well into the 3rd century AD. Throughout these years the Greeks kept their language, culture, and traditions, and continued to maintain control over their cities, which may help explain why, for the most part, the Greeks were loyal to Rome.

The late 2nd and 3rd centuries AD brought unwelcome changes to the Roman world as a whole. Civil wars, economic woes, migrations, and invasions from the north characterize this era in Roman history. Revolts erupted periodically in the 2nd century AD, including at least one in Greece: A small abortive rebellion occurred under the relatively benevolent rule of Antoninus Pius. The chaotic 3rd century AD brought civil wars and extensive Gothic raids to the Balkans. Greek territories were not immune. The restless northern peoples were no longer stopped at the borders of the empire after the death of Severus Alexander (AD 235). Thrace suffered the first assaults from Gothic invaders and related tribes. The emperor Decius was eventually killed by these invaders, which led to further raids and a civil war. The Danube and Rhine regions were the locations of most of this raiding activity, but in AD 254 raiders made their way as far south as Thessalonica. Many parts of Greece, especially coastal areas such as Athens, were severely damaged by these incursions. In the AD 260s further raids occurred. Gallienus repelled the intruders in AD 262, but he was soon forced to return to protect Greece again. Gallienus, just like Hadrian, was a philhellene, held the archonship in Athens, and was initiated into the Eleusinian mysteries. His support for Greece was sorely needed when in AD 268 the Heruli captured and wrought considerable destruction upon Athens. Eventually Gallienus expelled the Heruli, but such attacks were only slowed and would happen again in the future (most notably in the 5th, 6th, and 7th centuries).

In the 3rd century AD the empire was also faced with fiscal crises. Inflation worked to wreak havoc on urban financial structures. The content of silver coinage (the denarius) had become debased, while at the same time imperial mints were producing ever-growing quantities of money in an attempt to keep up with fiscal demands. The situation grew particularly painful for Greek cities and their elite, the *curiales* or *bouleutai* (“councillors”), who had drawn their revenues from civic lands, from taxes, and from local dues and tolls. Those leaders with access to goods, rather than money, were able to increase prices and rents, but they became hard pressed if they depended upon debased and devalued revenues. The *curiales*, thus, began to feel unable to

carry out their administrative duties. The needs of the imperial treasury, as expressed by the Roman *correctores* (regional governors, normally senators) who now governed Achaea, led to the loss of autonomy for any remaining free Greek cities. Increasing demands on the province as a whole required new strategies for production, which strategies would eventually result in a late Roman (4th- and 5th-century) resurgence of economic prosperity in Greece.

Upon Diocletian's accession to the throne in AD 284, the empire was temporarily at peace and the emperor set about solving the more serious economic and social problems in the provinces. To fix the problem of ruling vast territories, Diocletian reorganized provincial administrative units. There were 45 official districts in AD 117, but 108 districts by the end of the 4th century. Diocletian had expanded the number of Severan provinces by creating smaller provinces for easier administration and methodically divided the empire into clear eastern and western sections. The province of Achaea (with its capital still at Corinth) was incorporated into the administrative structure of the east. Diocletian placed Achaea into the diocese of Moesia, though Constantine moved the province under the jurisdiction of Macedonia in Illyricum. Northern Greece included the provinces of Epirus, Thessaly, and Macedonia. Crete remained a separate province. These provincial divisions continued to separate what we think of as "Greece" into several administrative units, but provided smaller territories that allowed for more efficient management and tighter control.

Once Diocletian stepped down from his office, conflict began again and the Balkans, Greece included, became a recruiting ground for Constantine's civil war with Licinius. Constantine, once in power, set about moving his capital to "New Rome" or Constantinople. In the tradition of earlier emperors, he felt it his right to remove art and artefacts from his provinces, including Achaea, to beautify his new capital. Nevertheless, 4th-century Achaea generally saw a renewal of building activity, an invigorated economy, and another revival of Greek letters after the hiatus of the civil wars. Subsequently, Achaean political, religious, and economic orientation was focused on the east and thus began the transition to the later Roman empire, or early Byzantine era in Greek history.

Polybius c.200–c.118^{BC}

Historian

Polybius is an invaluable contemporary witness of the rise of Rome in the 3rd and 2nd centuries ^{BC}. Where so much is now lost, Polybius' history, at least in part, survives. He was a member of a prominent Megalopolitan family; his father Lycortas held the chief magistracy (*strategia*) of the Achaean League and was a strong advocate of Achaean autonomy in the face of the growing power of Rome. Polybius' own political career was terminated by the Roman victory over Macedon in 168 ^{BC}; he was among 1000 Achaeans deported to Italy, not to be released until 150 ^{BC}. In Rome he formed a friendship with P. Scipio Aemilianus, which was to bring him into closer contact with the workings of the Roman state and later enabled him to accompany Scipio abroad, for instance on campaign to Carthage.

During this period of enforced leisure in Rome he began his history, an ambitious work in 40 books that took the whole Mediterranean as its subject. After two introductory books the history proper begins with the 140th Olympiad (220–216 ^{BC}), the date at which Polybius believed the history of Italy and Libya merged with that of Greece and Asia (1. 3). He was concerned to explain to his fellow Greeks "how and by what sort of government in less than 53 years the Romans came to conquer and rule almost the whole inhabited world" (1. 1. 5, cf. 1. 3. 7–10 for Greek readership). The 53 years ended with the demise of the Macedonian kingdom in 168/67 ^{BC}. At some point, however, perhaps after reflecting on the Roman destruction of Carthage and Corinth, he decided to extend his history so that it covered not only Rome's acquisition of power (books 3–29) but also the years that followed, up to 145/44 ^{BC} (books 30–39). His purpose was to provide the information that would allow the reader to pass

judgement on Roman rule; thus contemporaries could determine whether it should be avoided or welcomed and future generations whether it should be praised or condemned (3. 4). Polybius' own attitude to Rome has been variously interpreted, pro-Roman, anti-Roman, cynical, embittered, impressed; it is perhaps safest to say that he was ambivalent.

The first five books are complete, but the rest exist only in fragments, some quite substantial (in particular the remains of book 6). These are largely the work of Byzantine excerptors, although numerous citations can also be found in Strabo, Athenaeus, and Plutarch, a sign of Polybius' importance for later writers. The "Excerpta Antiqua", which date from no later than the 10th century AD, offer an abridgement of books 1–18, though without book 17. The remaining excerpts survive due to the thematic collections compiled under Constantine VII Porphyrogenetos and reflect the interests of 10th-century Byzantium. They fall under the following headings: *de legationibus* (on embassies), *de sententiis* (on sayings), *de virtutibus et vitiis* (on virtues and vices), *de insidiis* (on plots or ambushes), and *de strategematis* (on military stratagems). Some idea of what is missing can often be obtained from the Roman historian Livy who used Polybius extensively for events in the east in books 31–45 of his own history. None of Polybius' minor works is extant (on tactics, Philopoemen, the Numantine War, and perhaps one on the habitability of the equatorial region).

Polybius had strong views on the writing of history. He frequently breaks off to point out the failings of other historians, attacking the practitioners of sensationalist history (Phylarchus, Timaeus, Zeno of Rhodes) and scorning those who spend their time immersed in the library (Timaeus again, the subject of an extended critique in book 12). He himself stressed the importance of experience and autopsy; only someone with experience of war and politics could write satisfactorily on those subjects. For Polybius the study of history was of practical value, both for the politician and for anyone trying to cope with the vicissitudes of fortune; knowledge of the past helps in the present (1. 1). Polybius' outlook has been described as "utilitarian" and therefore distinct from his Hellenistic contemporaries (Walbank), but recently an attempt has been made to discern a moralizing tendency in his work (Eckstein).

Book 6 was a digression on the Roman state, with particular emphasis on the constitution and army, both of which he considered fundamental to Roman success and especially to their recovery after the disastrous defeat by Hannibal at Cannae in 216 BC. His analysis of the constitution was very much the work of an outsider, depending heavily on the concepts and categories of Greek political thought. The

strength and stability of the constitution, he argued, lay in its combination of king-ship (consuls), aristocracy (senate), and democracy (people). However inappropriate this may have been as a model to interpret the Roman constitution, it has had an enormous influence on subsequent western political thought from Cicero to Machiavelli, Montesquieu, and beyond. Its impact in the east is less evident; it was worth excerpting but its theory of the value of divided power was hardly compatible with Byzantine autocracy.

In the Greek world from late antiquity onwards the influence of Polybius appears to have been limited, although he is frequently cited in reference works such as Stephanus' *Ethnica* and the *Suda*. His subject may have appealed, but his style and length deterred. He had long before been damned by Dionysius of Halicarnassus who numbered him among those writers no one reads to the end (*De Compositione Verborum*, 4). Of the historians of late antiquity Zosimus is probably the only one to show any significant awareness of Polybius, but even here the influence is formal and superficial rather than substantial. Echoes of Polybius have been detected in Byzantine historians such as Procopius, Agathias, and Anna Komnene, but nothing is explicit. Byzantine lack of interest is evident in his absence from Photios's *Bibliotheca* and the truncated state of the text.

Biography

Born in Megalopolis c.200 BC, Polybius was the son of Lycortas, a wealthy aristocrat who was a leading figure in the Achaean League. Polybius went on an embassy to Alexandria in 180 and served as Hipparch of the Achaean League in 170/69. After the Battle of Pydna (168 BC) he was deported to Rome where he remained and became the friend of Scipio Aemilianus. He wrote a history of Rome's rise to power in 40 books of which 1–5 survive intact and the rest in fragments. He died c.118 BC.

Polygnotus

Painter of the 5th century BC

Polygnotus was the son and pupil of Aglaophon of Thasos; his brother Aristophon and a younger Aglaophon, probably his son or his nephew, were also painters. Polygnotus, a distinguished artistic figure of the early Classical period, worked in Athens at the time of Cimon, the leader of the Athenian democracy from 472 to 461 BC. In the absence of any surviving fragments of his monumental painting, literary texts – and Pausanias in particular – are the sole source of evidence, giving often lengthy descriptions of Polygnotus' works.

Much of Polygnotus' painting in Athens was in buildings associated with Cimon. According to Pausanias, who lived in the 2nd century AD, the wall paintings that decorated the shrine of the Dioscuri, the Anakeion, located south of the Agora towards the Acropolis, and the Stoa Poikile on the south side of the Agora were attributed to Polygnotus (he was said to have refused a fee for painting the latter). His work in the Stoa or in the Anakeion gained him Athenian citizenship.

These paintings were on view in late antiquity when Pausanias travelled to Athens, but are not preserved today, Polygnotus represented the wedding of Castor and Polydeuces with the daughters of Leucippus in the Anakeion and painted a scene of *Iliou Persis* (Troy Taken) on the interior back wall of the Stoa Poikile. In the latter, he was said to have given to Laodice, Priam's daughter, the features of Cimon's sister Elpinice, who was the artist's mistress, an element implying the idea of individual portraiture in the works of art of the time. The scene was painted on wooden panels secured to the wall, a common practice among painters of murals in Classical Greece.

Pausanias also mentions a set of pictures from the Trojan cycle by Polygnotus in the Pinakothekē (picture gallery) of the Periclean Propylaea. He had painted wooden panels to replace those decorating the Archaic gateway to the Acropolis, which was destroyed by the Persians and later reconstructed under Cimon. Thus, his paintings

were earlier than the Periclean building. *Achilles in Skyros* and *Nausicaa* were also in the Pinakotheke. Another painting attributed to Polygnotus was in Rome in Pliny's time, in the 1st century AD, and depicted a man with a shield. This was a fragment of a larger composition, most probably a wall painting on wooden panels, which had been transported to Rome.

Polygnotus' most famous works, however, were at Delphi, in the Lesche (club-house), which was dedicated to the sanctuary by the people of Cnidus. Although the date of this dedication is unknown, it is usually assumed that the building was put up after the liberation of the city from the Persians, as a result of Cimon's Eurymedon campaign, and that the paintings were executed between 458 and 447 BC. Only the foundations of the building survive, on a terrace near the top of the sloping sanctuary, and it would have been impossible to reconstruct the paintings without Pausanias' description. Two scenes on wooden panels, including some 70 figures (humans and animals), often named, in a scale half lifesize, decorated the interior of the building, which consisted of a rectangular room with a roof supported by wooden pillars set round a central area where athletic exercises took place. One represented the *Iliou Persis* in a more detailed version than that in the Stoa Poikile at Athens, and the second was a depiction of the *Nekyia*, the Underworld. The scenes met in the centre of the north wall and each occupied half of it; it is possible that they extended over the short walls. Besides a detailed description of the composition, Pausanias also refers to the problems with which Polygnotus had to deal and his way of tackling them.

Recent reconstruction has suggested that the *Iliou Persis* and the *Nekyia* formed three self-contained compositions, each spreading over three walls. The former consisted of the sea scene, the altar scene, and the land scene, while the latter included the sacrifice of Odysseus on the north, Achilles and Patroclus in the centre of the western wall, and groups of heroes from both sides of the Trojan War on the south wall. This arrangement of the individual groups was no doubt intentional, so as to enable Polygnotus to focus on the main emphasis of the various subjects in his painting.

He is also said to have worked in Boeotia. He painted *Odysseus after the Slaying of the Suitors* in the temple of Athena Areia at Plataea, the foundations of which are dated after the battle of 479 BC. He also worked at Thespieae, not far from Plataea, where his wall paintings were restored in the 4th century BC by Pausias of Sicyon. One of his paintings portrayed Salmoneus, the king of Elis, with a thunderbolt, a rare subject in the art of the period, which might have been part of a larger scene.

The composition represented an important departure from the

established principles of Archaic painting. The figures were not set down on the baseline of the picture, but were scattered on various levels, demonstrating a new concept for the representation of pictorial space, which is associated with the name of Polygnotus. The innovation is reflected in contemporary vase painting, as on the Niobid Painter *krater* (mixing bowl) from Orvieto, now in the Louvre, Paris. Moreover, Polygnotus' compositions were built up from figures in groups of two, three, or more. According to Pausanias, his paintings were characterized by a liking for quiet scenes with little action, often adaptations of earlier action themes to the new ideal of passivity, as in the change from the Sack of Troy into Troy Taken, as well as for the stillness of the figures. Ancient literary sources also attest that Polygnotus had a distinguished ability in the rendering of physiognomy, anatomy, and drapery to reveal the *ethos* (character) and *pathos* (emotion) of his figures. He presented them either before the action – in the process of taking a decision – or in their reaction after it. Another source for Polygnotus' art is Pliny's *Natural History*, compiled in the 1st century AD, which mentions that he painted women wearing transparent drapery and gave them headdresses of various colours, and also showed the mouth open and the teeth visible. Although certain elements of his art had appeared sporadically earlier, their combination by Polygnotus was pioneering.

Biography

The son and pupil of Aglaophon of Thasos, Polygnotus was a renowned painter who worked in Athens at the time of Cimon (fl.472–461 BC). Nothing of his painting survives. Pausanias and Pliny are our only sources. At Athens he painted for the shrine of the Dioscuri, the Anakeion, the Stoa Poikile, and the Pinakotheke. He also worked at Delphi and in Boeotia.

Pontus

The Greek *Pontos* (Latin *Pontus*) has in ancient Greece at least four

meanings or connotations, general and specific.

(1) In Greek mythology Pontos personifies the Sea, son of Gaia, the Land, who by Thalassa fathered another ancient sea god, Nereus. Hence (2) the *Euxeinos Pontos*, or Black Sea and, by extension, the southeastern littoral of that sea, called (3) the Pontus.

How the sea became a land is no mystery. Greeks approached and named the land from the sea. But from the land, on which it turns its back, the Pontus is one of the most strikingly distinct regions of Anatolia. Geography and climate, economy and settlement conspire to make the Pontus as obvious a maritime enclave as the Lebanon is of Syria. The territorial boundaries of the Pontus run for over 500 km from Sinope in the west to the mouth of the Akampsis (Çoruh) river to the east. Often less than 50 km inland this strip is hemmed to the sea by the Pontic Alps. Sinope is the hub of the Black Sea, where the seafaring cult of Poseidon was replaced by that of St Phokas. The Akampsis marks one of the oldest and most stable divisions in the world, traditionally between Europe and Asia, actually between Byzantium and Persia, the Ottoman and Russian empires, and today between Turkey and Georgia. The Pontic Alps rise gently south of Sinope, where they are broken by the Halys (Kizilirmak) and Iris (Yeşilirmak) rivers, which allow access to an Inner Pontus along the Lykos (Kelkit) valley. South of Trebizond (the modern Turkish city of Trabzon) a pass through the Pontic Gates near Zigana at about 2500 m carries the most easterly practicable land route to Persia, until the Pontic Alps reach the Paryadres (Kaçkar Dağ) at almost 4000 m, before falling into the gorges of the Akampsis. The Pontic Alps offer extensive summer pastures for nomads from the interior and transhumants from coastal Pontus, a region streaked by steep, well-wooded, and densely populated valleys, each with its own dialect and tartan, which connect to a chain of Classical Greek colonies along the coast. Here Greeks encountered barbarians, such as Jason found, represented in fable and fact by peoples such as the Amazons to the west and the monstrous Mossynoikoi to the east. Perhaps the most persistent of local identities is that of Chaldia, a basin on the southern side of the Pontic Gates around modern Gümüşhane, which takes its name from the Urartu sun god Haldi. Chaldia was a Byzantine theme (military province) from the 9th century AD and a surviving Orthodox metropolitan bishopric thereafter. To Turks *Halt* indicates people on the other, or “wrong”, side of the mountains. The Pontus is surrounded by less well-defined boundaries: Paphlagonia to the west, Cappadocia to the south, and Armenia to the east.

(4) As a political unit a kingdom of the Pontus first emerged in the late 4th century BC, in the aftermath of the conquests of Alexander the Great. Its focus lay inland along the Lykos and Iris valleys, particularly

at Comana Pontica (Gömenek), with a great temple economy, and a royal capital at Amaseia (Amasya), where the rock-cut tombs of the Pontic kings overlook a gorge of the Iris. A series of six Pontic kings called Mithridates extended the Pontic state from the 3rd century BC. Pharnaces I moved the capital from Amaseia to Sinope in 183 BC whence Mithridates VI Eupator (120–63 BC) conquered the Crimea and challenged Rome, with disastrous results. Mithridates VI died old and in despair in the Crimea and was buried by Pompey at Sinope. The last Pontic king, Pharnaces II, was defeated at Zela (Zille) by Julius Caesar in 47 BC. These Hellenized kings and their feudal nobility were of Persian origin and ruled a mixed indigenous population, traditionally settled in the *Chiliakomon*, thousands of nucleated villages.

Porphyry AD 234–c.305

Philosopher

Porphyry was one of the most influential philosophers and scholars of late antiquity, although from his vast output of more than 70 works only a handful survive. He was probably born in Tyre and bore the Syrian name Malchas. His international career is typical of many Greek-speaking Syrians of this period who made a considerable impact on the whole of the Graeco-Roman world. He was educated in Alexandria, at the Platonic Academy (under Longinus) in Athens, and finally in Rome where he studied under Plotinus. Perhaps his most enduring legacy was the introduction of Plotinus' philosophy to a wider world, achieved both by his careful edition of Plotinus' philosophical treatises under the title *Enneads* and his explanatory commentaries, which are now lost. Among others, Longinus, his former teacher, was grateful to Porphyry for sending him copies of Plotinus' work. A short and probably incomplete work popularly known as the *Sententiae* or *Ideas Leading to the Intelligibles*, which is the only substantial survival of Porphyry's metaphysics and which consists of paraphrases, summaries, and restatements of Plotinus' ideas, may have formed a part of these commentaries or of an introduction to Plotinus.

Porphyry's scholarly commentaries on the logical works of Aristotle and on some of the major Platonic dialogues (*Parmenides*, *Cratylus*, *Phaedo*, *Republic*, *Philebus*, *Sophist*, *Timaeus*) were so valued by his Neoplatonic successors that they were absorbed into their own works. Through Iamblichus, a fellow Syrian who may have studied with Porphyry, these works survive in the great commentaries of Proclus and later Neoplatonists. Porphyry was, in particular, responsible for securing a firm place in the Neoplatonic school curriculum for Aristotle's *Organon*, a virtually canonical set of his logical works. His *Isagoge* became, in both east and west, the standard introduction to Aristotelian logic and is frequently found in manuscripts of Aristotle's logical works. It is through Porphyry, too, that the ideas, and often the actual words, of earlier Aristotelian commentators (e.g. of Aspasius, Herminus, and Alexander of Aphrodisias) were handed on.
